| 1919 . . . | 7,764 | 2,783,803,434 | 40,246,772 |

The Post-Office Savings Bank was first inaugurated in 1875, and the rate of interest was raised from 4·2% to 4·8% in April 1915. The number of depositors increased from 10,052,641 on March 31 1910 to 20,088,713 in 1919, the deposits having advanced in the same period from 127,112,097 yen to 605,480,783. The figures at the end of the fiscal year 1920 were 23,787,626 depositors and 827,550,777 yen respectively.

*Telegraphs.*—Since 1879 Japan has belonged to the International Telegraph Convention, and in June 1908 she ratified her membership of the International Wireless Union. The expansion of her home telegraph service has been noteworthy. In 1910, with a total of 3,951 telegraph offices, 101,500 m. of wires were in use and 28,205,032 messages were sent; in 1919, there were 5,651 offices, 124,776 m. of wire in use, and 60,262,101 messages were transmitted.

*Wireless.*—In addition to the main wireless station of Funabashi, Japan has nine other shore stations, with a daytime transmission distance varying between 300 and 600 nautical m., the night distance being between 1,000 and 1,800 nautical miles. Two of these stations, Choshi and Osezaki, have been reconstructed and have a daytime transmission power of 1,500 nautical m., with 3,000 at night. In 1910 there were 7,817 wireless messages, and 121,974 in 1919.

*Telephones.*—When first inaugurated in Dec. 1890, the telephone service failed to attract many subscribers, but its popularity gradually increased, until in March 1918 there were 210,321 applications for installations outstanding, and the sums deposited by would-be subscribers in the hands of the authorities exceeded 3,000,000 yen. The authorities had started in 1909 a system of giving preference for an installation in consideration of a payment varying between 150 and 285 yen, according to locality, and this system, which has been very successful, still obtains. The maximum annual charge for the telephone service is 66 yen and the minimum 36 yen, according to locality, and at the end of the fiscal year 1918–9 there were 273,309 subscribers and 3,090 telephone offices, besides 799 fitted with automatic apparatus. At the same period the length of telephone lines was 9,467 m., the length of wires 700,651 m., and the number of messages in the year was 1,821,038,722.

*Aerial Communications.*—Japan keeps in close touch with the latest developments in aviation, and especially with those which hold possibilities of improving the facilities for the transmission of postal matter and goods. In 1920 and 1921 experiments in civil aviation were carried out, and early progress was anticipated.

*The Army.*—After the Russo-Japanese War, six divisions were added to the Japanese army, making the whole strength 19 divisions, and in 1915, two more divisions were established for the defence of Chosen. After the World War it was planned to bring the Japanese military organization up to the standard of efficiency and equipment set by new experiences in Europe. An 18-year reorganization scheme, involving 180,000,000 yen (£18,400,000) was passed by the Diet in 1918; and in 1920 it was decided not only to alter the scheme considerably but to expedite its execution and have it completed in 14 years. The estimate passed was 290,000,000 yen (£29,600,000). The expansion of the flying corps was also decided upon. There were to be six flying squadrons consisting of three flights and each flight was to be equipped with 12 aeroplanes.

The Japanese army consisted in 1920 of 84 regiments of infantry, 28 regiments of cavalry, 26 regiments of field artillery, 6 regiments of heavy artillery, 3 regiments of mountain artillery, 20 companies of engineers, 18 companies of commissariat, 2 regiments of communication troops, 1 regiment and 1 company of telegraph corps and 4 flying corps.

Under the system of conscription, able-bodied males of from 17 to 40 years of age are liable for service in the army. Those who have completed the middle school education or who are recognized to have had an equal education, can apply for the volunteer service of one year in lieu of the ordinary three years' service. A young man who is receiving a liberal education may be exempted from military service until it is finished; residents abroad are also exempted until they attain their 37th year.

The new scheme of organization entails the constitution of each division on a three-regiment basis and the abolition of the brigade. An army corps will thus consist of two divisions; and six army corps, exclusive of the Guards' division, are to be established. A Japanese infantry regiment contains four battalions, each of a strength of 600 men; a cavalry regiment has four squadrons, each of 100 sabres; six four-gun batteries, that is, 24 guns, are the strength of a regiment of field artillery, and a battalion of engineers consists of three companies, each 300 strong.

*The Navy.*—As a sequel to the Russo-Japanese War, the Japanese naval authorities came to the conclusion that the most efficient fleet unit would be the so-called "8–8 plan"; viz. a unit consisting of eight battleships, eight battle-cruisers and a suitable strength of subsidiary boats. The Diet agreed to the scheme in principle in 1917, but owing to financial reasons it was decided to start with an 8–4 fleet. In the following year, the Diet passed an expanded plan of 8–6 unit, spread over seven years. On account of the strengthened financial situation, the naval authorities proposed, in Dec. 1920, an additional appropriation of 751,900,000 yen (£76,990,000) beyond the 408,000,000 yen (£41,700,000) previously assigned for warship construction, with the view of completing the 8–8 unit scheme in eight years. The Diet gave its assent to this proposal in passing the Budget for 1921–2, and, according to this plan, Japan was expected to have in commission, by 1927, 4 battleships, 4 battle-cruisers, 12 cruisers, 32 destroyers, 5 gunboats, 12 fleet auxiliaries, 6 mine sweepers, and several submarines, thus bringing the strength of the Japanese navy in ships not exceeding eight years in age to 8 battleships, 8 battle-cruisers, 23 cruisers, 73 destroyers, approximately 80 submarines, 5 gunboats, 27 fleet auxiliaries and 120 submarines. In conjunction with this 8–8 scheme, the expansion of the naval air force was decided upon, and by 1923 the formation of 17 service corps and 2 practice corps was to have been completed.

In 1910 the tonnage of the Japanese navy was 524,273; in 1920 it was 796,288. In 1920 its strength was 15 battleships, 7 battle-cruisers, 9 armoured cruisers, 16 light cruisers, 14 coast-defence vessels, 8 gunboats, 87 destroyers, 20 torpedo-boats, and about 20 submarines. In 1910 the navy had 4,814 officers, 193 cadets, 14,616 non-commissioned officers, and 47,998 men.

## Domestic History

*Social Aspects.*—The chronological mutation from the Era of Enlightened Peace (*Meiji*) to the Era of Great Righteousness (*Taisho*) also incidentally registers a period of great historic moment for the Japanese people, who were gradually awakening to the evolutional necessity of moral reconstruction. The wars with China and Russia had given them the reassuring confidence that their country was safe from any foreign aggression, the fear of which had been a perpetual nightmare to the founders of modern Japan. The considerable achievements in the domains of her trade and industry strengthened their belief in the destiny of the nation. Especially the younger generation, whose cradles were neither haunted by the shapes of monstrous "black ships" and belching guns, nor were oppressed by the overwhelming influx of novel knowledge and strange customs, had set themselves to the task of self-orientation. Western literature itself, translated on a large scale into the vernacular, had taught them that the undigested application of foreign laws and institutions would do more harm than good to the national well-being. The alleged attempt on the person of the Emperor Meiji in 1910—a solitary occurrence in the age-long history of a patriotic people—brought men to serious reflection. The dazzling glory of victories was somehow eclipsed by the growing social agitation. Is it not the mission of the islanders of Nippon now to take upon themselves the creation of a new civilization by harmonizing and uniting the East and the West? This was the question which presented itself to the mind of young Japan. There followed a remarkable revival in the study of the Japanese and Chinese classics. There was heard a voice in the wilderness crying that men must return to nature before aspiring to be a Japanese, a father, a scholar, or in fact almost anything. A leader of the *Shirakaba* circle, a coterie of literary men strongly advocating the latter movement, selected a mountain site in southern Japan to establish his "New Village" to be conducted on the humanitarian principle. The repeated famines in the N.E. districts of Japan, the disastrous eruption of the Sakurajima volcano, the rapid rise in the cost of living, the revelation of bribery scandals, the frequent changes of Cabinets—all these worked together to cause popular dis-

quietude. The external relations of Japan, too, contributed their quota to the stirring of the popular imagination and excitement: Korea had been annexed; China had started a revolution; and California was adopting the policy of racial discrimination towards Japanese immigrants. But, what most deeply affected the heart of the Japanese people was the demise of the Emperor Meiji in July 1912. The whole nation mourned and lamented the loss of the great leader under whose rule modern Japan was created. The dramatic suicide, on the occasion of the Imperial funeral, of Gen. Nogi, the hero of Port Arthur and Mukden, added a climax to the national bewilderment. And the Era of Taisho was but two years old at the advent of the World War.

After several months of commercial depression the trade and industry of Japan began to prosper, and had attained a most remarkable development by the time of the Armistice. This progress, however, was not without its attendant evils: war profiteers—the *narikin* or queened pawns—sprang up like mushrooms overnight; into the maw of busy factories was poured a tremendous amount of labour; the cost of living advanced by leaps and bounds; but wages and salaries did not keep pace with the soaring prices. An age of Western capitalism was in sight. Public sentiment in Japan was, moreover, heartened by the Allied assertions that the war was a democratic crusade against the rule of despotism. The word "democracy" was on the lips of the man in the street. Strikes, which had long been stifled by Article 17 of the Peace Police Regulations issued in 1900, practically prohibiting the establishment of trade unions, began, despite all restraining circumstances, to be more and more frequently organized. Encouraged by the results achieved in 1916, the following year saw no less than 417 strikes involving 66,000 wage-earners, and in 1918 the number increased to 497. Most of these resulted in favour of the workers, earnings being ultimately nearly trebled in some trades and a marked improvement being also effected in the hygienic conditions of the workpeople. A significant incident, which was the spark to ignite the train of strikes in 1918, was the "rice riot" started in Toyama, a small town on the coast of the Sea of Japan, by village fisherwomen whose thread of patience had snapped at the never-ending rise in the price of that commodity. The whole nation was involved in the general conflagration which followed. There occurred, in rapid succession, strikes in Nagoya, Kobe, Osaka, Tokyo and elsewhere, and riot and destruction took place to such an extent that the Government, at last, found it necessary to resort to the use of troops in the pacification of the angry mobs.

Even such methods as sabotage and "ca'canny" strikes were introduced. As a consequence, no less than 200 new labour organizations were formed, of which the *Yuai Kai* and a dozen others are of importance. The Government, in an eager attempt to meet the extraordinary developments of the situation, encouraged the establishment of the *Roshi Kyocho Kai*, or the Labour and Capital Harmonizing Association, which came into being in 1919 with Prince I. Tokugawa as president and Visct. Shibusawa as one of the vice-presidents. Moreover, Japan participated in the International Labour Conference; the revision of the Factory Law which was enacted in 1911 and came into force in 1916, was taken in hand. Meantime, popular agitation against the bureaucratic method of administration arose on all hands, and the question of universal suffrage was vociferously discussed. In the spring of 1918 a reform bill was passed, and the number of electors was doubled.

With the restoration of peace, however, a slump set in, profits fell and the demand for labour abated. The unemployment question also arose to a certain extent, but not in an entirely threatening aspect. Although the high-water mark of labour agitation had probably been reached by 1921, the causes for the phenomenon remained to offer food for the deepest reflection on the part of the thinkers and statesmen of Japan. The national characteristics of Japan, which are the heritage of her history—the peculiar harmony and self-restraint pervading all classes of the people, the spirit of individual sacrifice and self-abnegation, in the interests of the whole—were indeed strong relieving factors in all the social unrest she had experienced. How far this mentality was the legacy of feudalism and destined to disappear in time, and how far it was born of the unique social conditions of the Yamato race, which has remained homogeneous and unmolested on the Far Eastern islands for 30 long centuries without a single case of successful external invasion and subjugation, is a question which perhaps the future alone can definitely answer. Be that as it may, it was the eager hope of young Japan in 1921 that she might struggle to work out her own solutions of the perplexing problem of capital and labour.

*Political Developments.*—Owing to the necessity of establishing a strong central authority—imposed upon Japan for self-defence owing to the apparently aggressive policies in the Orient of the Western Powers towards the end of the 19th century—and probably from an abundance of conservative caution, as the country had just emerged from ages of feudalism, the makers of modern Japan often turned to German legislation in seeking for models of the constitution and other laws. But an important factor that should not be lost sight of by students of Japanese politics is that English has long been by far the most extensively studied foreign language among the people. Whilst the static institutions remain more or less Teutonic in form, dynamic inspiration has continuously been drawn from English-speaking sources. That explains why the Japanese body politic understands democracy along the lines of its common acceptation in the British Empire and the United States; why the press and students of politics often advocate the development of a polity somewhat like the British parliamentary system. The political history of Japan in 1910–21 was the last phase of the struggle between the wise council for the national security with which the *Genro*, the Elder Statesmen, are popularly identified, and the progressive outcry for the emancipation of the people's will. As external dangers diminish, *vox populi* speaks more effectively.

After the longest tenure of office in the constitutional history of Japan, four and a half years, Premier Katsura resigned in Aug. 1911, "with a view to renovating the spirit of the people." With the collaboration of Marquis Komara, Foreign Minister, Marquis Katsura had accomplished with great merit various financial reforms, the annexation of Korea and the revision of commercial treaties with the Western Powers. Katsura was succeeded by Marquis Saionzi, who had been leading the Seiyukai party after the retirement of Prince Ito (*see* 15.272).

It was during the premiership of Marquis Saionzi that a tremendous moral shock was experienced by the whole nation on account of the death on July 30 1912 of the Emperor Mutsuhito, the centre of reverence and affection of the nation. Meiji Tenno, as he was posthumously styled after the name of the era of his 45 years' reign, which stands out with glorious prominence in the annals of the empire, was succeeded by his son, Yoshihito Shinno, who ascended the throne at the age of thirty-three.

The downfall of the Saionzi Cabinet was due to a very peculiar circumstance, which is accounted for only by the paramountcy of the instinct of national self-defence. Before the year 1912 had closed, the establishment of two army divisions in Korea (Chosen) had been tenaciously persisted in by Lt.-Gen. Uyehara, Minister of War. But his colleagues on the Cabinet, as well as the press, counselled retrenchment and economy. Uyehara resigned; and the premier sought for his successor. But no soldier would accept the post without a commitment by Saionzi as to the two-division increase; and by law a Minister of War must hold the rank of a general or lieutenant-general in the active service. The premier was constrained to request the Emperor to relieve him from his office. There followed a ministerial deadlock, until Katsura, actuated by chivalrous motives, descended upon the confused arena. He had been created a prince, and had made up his mind to offer the young Emperor the loyal but non-political services of the rest of his life in the capacity of Grand Chamberlain and Lord Keeper of the Great Seal. The young and care-free generation of Japan had come to assert themselves, and the unconstitutional tendency of the *Genro's* activities had been made the object of popular criticism. The wide-spread suspicion that he harboured the intention of attempting to direct the affairs of state unconstitutionally "from behind the sleeves of

the Sacred Dragon," coupled with his personal failing health, made the path of Prince Katsura's renewed political life immeasurably thorny and arduous. He found the Lower House unexpectedly untractable. Mr. Ozaki's resolution of no confidence caused a tremendous sensation; riotous mobs demolished the offices of the *Kokumin*, which newspaper had been loyally supporting the ministerial programme. No choice was left Katsura but to tender his resignation.

As soon as Prince Katsura became unfettered from official duties, he essayed to demonstrate his sincere aspirations for the constitutional development of the Empire by starting a political party, the *Rikken Doshikai* (the Constitutional Comrades Association). Under this banner there rallied all the members of the Chuo Club, and a majority of the members of the *Kokuminto* (the National party). But before the realization of his hopes Katsura died in the following December. The Yamamoto Cabinet which followed (Feb. 20 1913) was short-lived, owing to the unfortunate "naval scandal," involving the arrest and trial of high officials in the navy; the Siemens-Schuckert Co. had dispensed bribes in connexion with the building of a Japanese warship.

After the refusal of Prince I. Tokugawa, and the abortive attempt by Visct. Kiyoura, to form a Cabinet, Count Okuma, the "grand old man" of Waseda, undertook, on April 14 1914, to stand at the helm of the Empire, backed by the legacy of Katsura, the *Doshikai*, and Baron Kato, the leader of that party, was entrusted with the portfolio of Foreign Affairs. It fell to the lot of this Cabinet to deal with the invitation of Great Britain to join in the World War under the Anglo-Japanese Alliance.

In Nov. 1915 the enthronement of the Emperor was conducted with the time-honoured imposing ceremonies at Kyoto, and the whole nation was *en fête* for seven days.

Premier Okuma, in tendering his resignation on account of indifferent health, in the summer of 1916, recommended Visct. Kato, who had yielded the charge of Foreign Affairs to Visct. Ishii and was outside the Cabinet, to be his successor. At that moment, however, the *Genros* are reported to have intervened, and, in spite of the fact that Kato's new party, the *Kenseikai* (the Constitutionalists), which was an amalgamation of the *Doshikai*, the *Chuseikai* and *Koya* Club, commanded a majority in the diet, Marshal Terauchi was appointed premier on Oct. 9. This alleged irregular development excited the hostility, not only of the Kenseikai, but of the general public, and ended in an antagonistic attitude on the part of the diet towards the new Government. Parliament was dissolved, and a general election took place on April 20 1917. The result was a signal victory for the Government party, the Seiyukai winning 157 seats, whilst the number of the Kenseikai dwindled from 204 to 117.

Actuated by the desire, in view of the war, to effect unity of all shades of opinions, Premier Terauchi's ingenuity brought forth soon after his instalment in office the Temporary Diplomatic Investigation Council (*Rinji Gaiko Chosa Kai*), where leaders of all political parties were represented. Kato was invited to join, but refused on the ground that he could not associate himself with the idea of establishing a responsible body for external affairs outside of the Cabinet itself.

The "rice riot" and the ensuing serious disturbances, and strikes which raged like wild-fire in various parts of Japan in the summer of 1918, sealed the fate of the Terauchi Cabinet, which tendered its resignation in the middle of September.

By that time democratic ideas had been gaining strength on account of the war and internal social unrest. Moreover, the manner in which the Terauchi Cabinet was installed had its due reaction. The people demanded that the next administration should be more in keeping with the spirit of the parliamentary system. Mr. Takashi Hara, the leader of the Seiyukai in succession to Marquis Saionzi, was entrusted with the task of forming a new Cabinet, as the first commoner to hold the office of premier in Japan. The ministers, except those holding the portfolios of War and the Navy, were, for the first time, a body of party politicians more or less free from the bureaucratic savour which had always clung to the former administrations. Incidentally, a new Ministry—that of Railways—was included in the Cabinet. In March 1918, in response to the popular demand, a political reform bill was passed, lowering the property qualification of voters to the payment of a direct national tax of three yen instead of ten yen. The number of electors was thus more than doubled, increasing from 1,450,000 to 3,000,000. The people were, however, not satisfied, and a year of popular clamour for the universal suffrage followed. In Feb. 1920 a universal suffrage bill was at last introduced by the Opposition in the House of Representatives. But, on the ground that no election on the basis of extended franchise had as yet taken place and consequently it was premature to make any further attempt at suffrage reform, the diet was immediately dissolved. The nation was called upon to express its opinion on the matter by the general election of May 10. The result was a decided victory for the Seiyukai, the Goverment party, which secured 280 seats, whilst the Kenseikai registered 110.

### Foreign Relations

Having emerged victorious from the Russo-Japanese War, Japan was relieved from the long nightmare that Korea might be engulfed in the Russian hegemony and constitute a permanent menace to her national safety; moreover, the wrong done to her by the three-Power intervention in wresting from her the natural fruits of her victory in the Chino-Japanese War—the Liaotung peninsula—was fully and conclusively avenged. But the Russian grip on N. Manchuria and Mongolia was not only unabated but, on the contrary, became signally tightened. There were even fears of a renewed clash between the quondam foes. Statesmanship, however, counselled Japan and Russia to come to a friendly entente in 1907. There was made a similar understanding between Japan and France in the same year. Further, the complicated post-war situation in Manchuria was decisively, if not definitely, disposed of by the Chino-Japanese understandings of 1909. In 1910 and 1916 more definite agreements were reached between Japan and Russia with the view of maintaining the *status quo* of Manchuria. Korea was, in the meantime, made a Protectorate of Japan, and the gradual development of affairs in that country led to the final annexation. The Anglo-Japanese alliance, which had been not only the keystone of Japan's foreign relations, but the mainstay of the general tranquillity of East Asia, was renewed (1911). Whilst Japan's position in the Far East became thus more or less reassuring, the dark cloud of anti-Japanese sentiment, on the Pacific coast of the United States, loomed up on the horizon. China's revolution in 1911, instead of bringing immediate peace and liberty to the denizens of the Celestial Empire, divided the nation into two irreconcilable camps, and contributed temporarily to the political instability of the Extreme Orient. To the neighbouring Japan, this meant an exacting burden upon her diplomatic wisdom and tact. When Japan was, on the one hand, racking her wits how to cope with the quicksand situation in China and, on the other, how to safeguard Japanese residents against discriminatory treatment in the west of America, the fateful Aug. of 1914 came to pass.

Japan's part in the World War dwindles into insignificance in face of the stupendous efforts of other great Powers espousing the Allied cause. But she contributed what little she could with her very limited national strength and resources. Her geographical situation, however, afforded her, from the economic point of view, a position of vantage. In pre-war days she was still struggling in financial straits as a result of her Russian conflict, but she came out of the World War with overflowing coffers, even if these coffers were of modest dimensions. At the Peace Conference in Paris, she lost her issue on the question of racial dignity, but her claims with regard to Shantung and the South Sea Islands were recognized; and her position among the great World Powers was assured. But her immediate outlook in 1920–1 bristled with difficulties and complexities: China had refused to negotiate Japan's offer to restore Shantung; the Washington Government would not be persuaded to the Japanese point of view on the Yap question; several states on the Pacific coast of America were vying with each other to abridge the civil rights of Japanese residents; Korean malcontents abroad were in a

fitful mood of rebellion; the Siberian situation was far from being tranquil. Japan's natural path of aspirations was beset with suspicions and misunderstandings. Never before in Japan's diplomatic history was she burdened with weightier responsibilities.

*Manchurian Question.*—Prior to the outbreak of the Russo-Japanese War, the growing international rivalry for spheres of influence in the Chinese Empire had convinced the interested Powers of the necessity of establishing the policy of the "open door" and equal opportunities for commerce and trade in that country. That principle was from time to time enunciated by Great Britain in the latter decades of the 19th century, but it was reserved to Mr. John Hay, Secretary of State under President McKinley's administration, to make its definite pronouncement to the world. In Secretary Hay's Circular Note addressed to various Powers under date of July 3 1900, it was declared that the policy of the United States was to assure permanent safety and peace to China, to preserve Chinese territorial and administrative entity, to protect all rights guaranteed to friendly Powers by treaty and international law, and to safeguard for the world the principle of equal and impartial trade with all parts of the Empire. The doctrine was accepted in principle by Japan, Great Britain, Russia, France and Germany. Japan went so far as to conclude specific agreements for its execution with Russia (July 30 1907) and France (June 6 1907). It was, however, understood that the spheres of influence already established—Great Britain in the Yangtsze valley, Tibet, and Weihaiwei; Germany in Kiaochow; Russia in Manchuria and Mongolia; France in Yunnan—were not to be prejudiced by the newly professed principle of commercial impartiality.

The Russo-Japanese War brought about the tenure by Japan in S. Manchuria of a similar position to that which the great Western Powers had held in other parts of China. But "because Manchuria had been the scene of the greatest war of modern times," the world's eye became fixed upon every act of Japan in that region in "an exceptionally rigorous scrutiny" and "the nations behaved as though they expected her to live up to a standard of almost ideal altitude." Meanwhile, China, for her part, fell into a mood of impatient irritation on account of the presumed encroachments upon her sovereignty, and the "rights-recovery campaign," clamorously conducted throughout that Empire, somewhat strained her relations with Japan in the early part of 1909 in respect of various questions in Manchuria. However, in Aug. of that year, a series of agreements was reached between the two States by which all those outstanding problems were composed. Among the rest, Chinese sovereignty over Chientao was confirmed, and arrangements about railways, including that of the Antung–Mukden line, were effected.

From out of the blue, there came from America a proposal for the neutralization of the Manchurian railways in Jan. 1910. In the view of Mr. Philander C. Knox, Secretary of State, that was best calculated to further the principle of the "open door" by putting an end to the abnormal conditions obtaining in Manchuria. But Russia and Japan could not accede to the scheme, on the grounds that their established rights and interests ought to be respected and that they were by no means threatening the Chinese sovereignty or the "open door" principle. Great Britain kept aloof, declaring that the question should be settled among the immediately interested Powers, namely, China, Japan and Russia. Nor was the proposal to the taste of China, who regarded it as a further encroachment upon her sovereignty. She replied that her treaty obligations with Japan and Russia precluded her from supporting the American idea. And the proposal fell through. Meanwhile, the Russo-Japanese negotiations as to their future attitude in Manchuria and Mongolia came to a satisfactory conclusion and a steadying element was added to the situation in the Far East in the form of an agreement between Japan and Russia, signed at St. Petersburg on July 4 1910, under which they pledged themselves to maintain the *status quo* in Manchuria and to abstain from any unfriendly competition in the development of that region. The Russo-Japanese *rapprochement* was further solidified, in view of the World War, by the Convention of July 3 1916, which provided that each of the two countries would not become a party to "any political arrangement or combination" directed against the other and that they would take counsel together for the necessary measures, "should the territorial rights or the special interests in the Far East of one of the High Contracting Parties be threatened." The agreement made greatly for the maintenance of good order in the Orient until the Russian Revolution brought about the drastic change of the whole situation.

*Annexation of Korea.*—Japan had waged two wars, one against China and the other against Russia, in order to prevent Korea from becoming "a dagger pointed against Japan's heart." In June 1905 she established a protectorate over the Hermit Kingdom so as to put a definite end to the wayward and suicidal diplomacy of the Seoul courtiers, but the whole peninsula could not be cleansed of its inveterate political and social iniquities. The hopelessness of real reform under the existing régime had become manifest; and the assassination of Prince Ito by a Korean, in Oct. 1909, was the climax.

The Tokyo Government thus came to the conclusion that "the responsibilities devolving upon Japan for the due administration of the country (Korea) cannot be justly fulfilled without the complete annexation of Korea to the Empire." The fusion was accomplished by a treaty concluded between the Governments of Japan and Korea on Aug. 22 1910. It was decided that the ancient name of *Chosen* should be revived in lieu of Tai-Han and in future be officially used. Under the terms of the treaty, the Korean Imperial House was assured of high honours and dignities as well as a liberal grant for maintenance. Japan, at the same time, notified the foreign Powers concerned that their treaties with Korea, including those of extra-territoriality, were all annulled; but that, nevertheless, their vested rights and interests would be fully respected; that the tariffs in force in Korea would be maintained for 10 years; that cabotage would be permitted to foreign vessels for the same period; and that the port of Masanpo would be closed for naval reasons, but Shin Wiju or Gishu would be added to the open commercial ports.

*The Anglo-Japanese Alliance.*—The general changes of situation in the Orient after the Russo-Japanese War, notably the annexation of Korea to the Japanese Empire in 1910, impelled the British and the Japanese Governments to revise the Agreement of Alliance concluded in 1905. The negotiations in London between Sir Edward (afterward Visct.) Grey and Baron (afterward Visct.) T. Kato ended in the renewal of the Alliance on July 13 1911. The important feature of the new agreement was the inclusion of an Article exempting either high contracting party from the obligation to come to the armed assistance of the other when a general arbitration treaty was concluded between that other Power and a third party (Art. IV.). At that particular time a treaty of such a description was under negotiation between the British and the American Governments, and it was with the particular object of excluding the United States from the application of the Alliance that Art. IV. was inserted. The proposed general arbitration treaty, however, failed to obtain the consent of the American Senate for its ratification, but the British and the Japanese Governments undertook on several occasions to make it clear that the spirit in which the Article was conceived had not on that account been altered in the least. The Alliance of 1911 was to last for 10 years, and, in the absence of a year's notice from either contracting party to terminate the agreement, it would automatically continue in existence, even after July 1921, until such denouncement was made. The World War, into which Japan readily entered on account of the Anglo-Japanese Alliance, ended with the Treaty of Versailles which brought forth the League of Nations. The question was then mooted, though more academically than politically, whether the Anglo-Japanese Alliance would not be in contravention with the letter of the Covenant of the League, and on July 8 1920 the two high contracting parties addressed a joint note to the Secretary-General of the League to the purport that the Agreement of Alliance would in case of its renewal be made to conform to the Covenant in its form. The renewal of the Alliance was discussed at the British Imperial Conference in London in June 1921; and

it was then announced that, under the terms of the treaty, it would continue, without definite renewal. But at the Washington Conference, in Dec., the agreement made for a four-Power treaty (America, France, England, Japan) provided for the Anglo-Japanese Alliance being brought to an end.

*The Chinese Loan Consortium.*—A gradual change came about in the opening years of the 20th century in the general policies toward China of the Great Powers, who had become convinced of the fruitlessness of mutual competition; signs also became visible of the altered attitude of Western financiers in regard to the investments in that Empire. In 1908, a British and a German bank undertook to finance in common the Tientsin–Pukow railway. In 1911, a four-Power group consisting of Great Britain, Germany, France and the United States, was formed in connexion with the Hankow–Szechuen railway loan, as well as the loan for currency reform in China and industrial enterprise in Manchuria. Japanese and Russian bankers agreed to join this Consortium in 1912, with the understanding that the special interests of Japan and Russia in Manchuria and Mongolia would not be interfered with in the internationalization of the Chinese loans. With the inauguration of Mr. Woodrow Wilson as President in 1913, the U.S. Government decided to withdraw their bankers from the Consortium, and subsequently the World War prevented Germany from remaining in the financial league. In 1917 the Consortium, now comprising the four Powers, Great Britain, France, Japan and Russia, invited the United States to rejoin in its activities. The American Government hesitated at first to respond to this call, but in June 1918, took the initiative for the reconstruction of the financial group. By that time the Tsarist régime in Russia had come to an end, but the other nations interested expressed their assent to the American proposal; and negotiations were started in May 1919, in Paris, between the financial representatives of Great Britain, France, Japan and the United States, simultaneously with the Peace Conference. After considerable interchange of views, part of which concerned the reservations by Japan as to S. Manchuria and E. Inner Mongolia, an agreement was signed in New York on Oct. 15 1920. The most important feature of the new agreement was that the object was purely and simply economic, being entirely free from any political complexion. All the members were to pool their existing and future loans (*i.e.* options) both as regards industrial and administrative undertakings, with the exception of the industrial enterprises upon which substantial progress had already been made. As to Manchuria and Mongolia, the Powers arrived at a satisfactory understanding, Japan withdrawing her previous reservations. The statement of the Japanese Government issued on April 1 1921 contained the assurance that Japan only desired in those regions definitely to ensure "her national defence and the security of her economic life," and she was confident that she could safely rely upon the mutual trust and friendship of the Powers in regard to the exigencies of any situation that might arise in future.

Equality of opportunities was fully guaranteed to all members, thus eliminating unnecessary and harmful competition. It was believed that this cooperative action of the various banking groups, which alone could offer the enormous amount of capital necessary for the reconstruction of Chinese economic life and for the building of sufficient means of communication and transportation all over her vast territory, would be in the best interests of the Chinese people.

*The Anti-Japanese Movement in America.*—In the opening years of the century, the continuous influx of a large number of Japanese immigrants from the Hawaiian Islands to California had caused much alarm to the labour organizations in that state, and even in wider circles. Anti-Japanese feeling first overtly manifested itself by the attempted segregation in 1906 of Japanese children in the public schools of San Francisco. With characteristic perspicacity, President Roosevelt early discerned that public sentiment on the Pacific slope towards the Japanese was taking an untoward course, and, bent upon stemming the tide in time, in 1906 he advocated, in his presidential message to the Federal Congress, that an Act should be passed investing the Japanese, who had "won in a single generation the right to stand abreast of the most intelligent and enlightened peoples of Europe and America," with the right to naturalization, which had been reserved to "free white persons, aliens of African nativity and persons of African descent." The lawgivers at Washington, however, did not, or could not on account of the agitation in the West, so much as consider the question. Nevertheless, an informal agreement was reached between the Washington and Tokyo Governments, by which Japan pledged herself that she would not issue passports for the continental United States to those classes of Japanese who would, or might, engage in manual labour. Those Japanese who had previously resided in the United States, or were the immediate relatives of Japanese immigrants already in the United States, or the "settled agriculturists" who were to assume active control of an already established farming interest (only three or four persons actually came under this last category), were to be accepted. Japan engaged herself to observe this arrangement voluntarily, and the sincere efforts of her Government in executing it received recognition from many American publicists.

This "Gentleman's Agreement," as it was generally styled, was confirmed by a declaration on the part of Japan made simultaneously with the revision of the Treaty of Commerce and Navigation in Feb. 1911. However, the feeling against the Japanese in the United States subsequently became more and more pronounced. Apart from sporadic legislation imposing restrictions on them with regard to civil rights, such as marriage and the pursuit of an avocation, the Alien Land Act was passed by the California Legislature in May 1913, and put into force three months later, despite strong Japanese protests and repeated admonitions from Pres. Wilson's Cabinet. This law prohibited aliens ineligible to citizenship of the United States (including companies the majority of whose interests were under the control of such aliens either in point of their number or the amount of capital held) from owning land in the state of California, allowing them only the privilege of leasing land on a three years' tenure. The terminology employed invested this law with an appearance of innocent impartiality, but it was none the less obvious that the Japanese alone would, in point of fact, be the sufferers from an invidious discrimination.

The exigencies of American participation in the World War tended to lull Californian opposition towards the Japanese. But, with the termination of the war, it was renewed. In spite of the efforts of the Japanese Government to respect the susceptibilities of their American neighbours, of which the stoppage of passports in the spring of 1920 to the so-called "picture brides" was an example, the day of the presidential election—Nov. 2—witnessed the passage by the Californians of the most drastic law yet enacted against "ineligible aliens," by which they forfeited even those rights which they had formerly been allowed to retain of holding land under a three years' lease. The Federal authorities had been averse to such a step, but the "initiative" poll decided in favour of the enactment by a majority of three to one (668,483 to 202,086 votes), and the law came into force as from the Dec. following. Thus in 1921 no Japanese might own or lease land, neither could he act as guardian of his own American-born offspring (who are of right American citizens) in whose name land is held, nor might he possess a share even in American-controlled landowning companies. "In that State," wrote *The Nation* (New York), "America's traditional sense of fair play has been swept away in a ferment of race prejudice and campaign buncombe. The notion that the Japanese land ownership constitutes a 'menace' in the sense employed by anti-immigrationists is entirely refuted by the facts. Of the 28 million acres of farming area which compose one-fourth of the State's total acreage, only 458,000 acres, or 1.6 per cent, are under cultivation by Japanese. But this is not all. Of this small proportion not over 27 thousand acres—less than one-tenth of one per cent—are owned by Japanese, the balance being made up of lands cultivated by Japanese under leases, under crop share contracts, under labour contracts, and finally, of 48,000 acres owned by American corporations with some Japanese shareholders."

Anti-alien land legislation would appear to have become the fashion on the Pacific slope in 1921, the example set by California being emulated by Nebraska, Idaho, Oregon and Washington; the last two states, be it remarked, had systematically refused to make common cause with California during the past decade.

In the meantime, conversations were taking place at Washington between Mr. Roland S. Morris, the American ambassador in Tokyo, and Baron Shidehara, the Japanese ambassador in Washington, with the view of working out a formula which, whilst providing a practical solution of the unfortunate and complicated problem, would be at the same time acceptable to both nations. An agreement was reported to have been reached in Feb. 1921, and it appeared that it remained for the new Republican administration to give its assent in order that the desired arrangement might be put into actual operation.

There would appear to be some misapprehension with regard to the rights of foreigners in Japan to hold land and it has been stated that no such rights exist. This is not the case, as all persons, without discrimination, who are not Japanese subjects, may enjoy absolute ownership of land, if they are formed and registered under Japanese law as a juridical person, that is, as a partnership or corporation. There are, in fact, many such corporations in existence in Japan, composed exclusively of aliens.

Foreigners are further permitted to acquire rights in land, other than ownership, on the same footing as Japanese nationals, the following being some of the most important of these rights.

1. *Superficies.*—This is a right *in rem* by virtue of which land belonging to another person can be used for the purpose of owning thereon structures, trees or bamboos. It can be created even though no structures, trees or bamboos are actually in existence on such land, provided that the object and intention is to use the land for the purpose named. The law contains no limitation upon the period of time for which that right can be created, consequently a superficies for, say, 1,000 years will sell for a sum closely approximating to the value of a right of absolute ownership.

2. *Emphyteusis.*—This is a right *in rem* to carry on agricultural or stock farming on the land of another person. The period of time for its duration is to be fixed by the parties concerned at not less than 20 years and not more than 50 years.

3. *Lease in Perpetuity.*—This is a lease without limit as to its duration, and, for all practical purposes, it is as good as ownership. It was originally granted to foreigners within the Foreign Settlements for a nominal consideration paid to the Japanese Government. Although the Foreign Settlements were abolished in 1898, perpetual leasehold survives and is still enjoyed by foreigners.

4. *Leasehold.*—This is a right *in personam*, effective only as between the parties concerned. When registered, however, it can be set up against third persons as the effect of such registration. The duration period is fixed at 20 years, renewable for a further 20 years from the time of renewal.

*The World War.*—No sooner had the World War broken out in 1914 than there took place several exchanges of views between the British and the Japanese Governments as to possible assistance by Japan in the protection of British trade in the Far East. Japan soon made it clear that she was prepared to take the responsibility imposed upon her by the Anglo-Japanese Agreement of Alliance, should the menace by the Germans to British interests necessitate such a step. It was not long before such a contingency arose, and on Aug. 15 1914 the Japanese Government sent an ultimatum to Berlin demanding the immediate withdrawal of the German warships from Chinese and Japanese waters and the surrender of Kiaochow to Japan by Sept. 15, with a view to eventual restoration of the leased territory to China; a week was allowed to the German Government in which to make a definite reply. On Aug. 23, the term having expired without any answer being forthcoming from the Kaiser's Government, Japan declared war against Germany. In coming to this decision Japan remembered that it had been through the machinations of the Berlin Government that Germany, France and Russia acted jointly in 1895 in "advising" Japan in the name of peace in the Orient, and not without a hint of force, to retrocede to China the peninsula of Liaotung, which had been won by Japan at a heavy sacrifice of life and treasure and ceded to her under the Shimonoseki Treaty, and further that it was barely two years after that incident that Germany had installed herself at Tsingtao on a flimsy pretext. The Japanese nation welcomed the opportunity of eradicating the German menace in the East which owed its inception to such unfortunate circumstances.

*The Capture of Tsingtao.*—The first part which Japan took upon herself to play after she aligned herself with the Allies, was the reduction of the German stronghold in the Far East. Tsingtao, on the bay of Kiaochow, had been converted in the hands of the Germans into one of the most impregnable fortresses in the Orient—the "mailed fist" calculated to intimidate any possible objectors to the Kaiser's imperialist aims. It served at the outset of the war as the only base of operations in E. Asia for the German marauders menacing the Allied trade routes. The five German warships forming the main part of Adml. von Spee's squadron had been running amok, not only in Chinese and Japanese waters, but as far as the South Seas. It was imperative to make these raiders homeless, if they could not be captured or destroyed, and the military and naval operations against the redoubtable base, which was under the command of Capt. Meyer-Waldeck and garrisoned by some 13,000 men, of whom 5,599 were German regulars, were started with the utmost dispatch. On Aug. 27, the blockade of Kiaochow Bay was declared by the Japanese navy and Lungkow, 150 m. N. of Tsingtao, was chosen as the point for landing troops. The selection of Lungkow as the spot for disembarkation had been agreed upon between the Japanese and British commanders, who saw the necessity of clearing the hinterland prior to the landing of troops at some point nearer the fortress. However, the point being outside the zone of the leased territory, it was thought necessary to have a war zone established, following the precedent of the Russo-Japanese War, and negotiations with that view were started between the Japanese and the Chinese Governments as early as Aug. 20. An understanding was soon come to between the two Governments, and the Peking Government issued a declaration establishing such a war zone on Sept. 3. The Chinese Government, in the meantime, intimated to the Japanese Government that it might nevertheless be found advisable to enter a formal protest to Japan against her troops' landing at Lungkow, for the sole purpose of exonerating themselves from all responsibility towards the German Government. Upon Germany's strong protest against permitting the Japanese troops to land in the neutral territory, the Chinese Government went so far as to point out that Germany herself had in a measure created the situation through her unauthorized fortification of Tsingtao.

On Sept. 2 1914, the Japanese division, under the orders of Lt.-Gen. Kamio, commenced landing at Lungkow, in the teeth of a heavy downpour of rain, which swelled into a terrible tempest and caused the whole district to be flooded as it had not been flooded for half a century; the advance of the troops was therefore immeasurably hard and dangerous. They had to wade through muddy streams; their diet for days consisted of a handful of millet. Despite such extreme adversity of circumstance, the vanguards arrived on the 12th at the small town of Chimo, where they encountered the enemy for the first time. In the meantime, the railway connecting Tsingtao with Tsinan, the capital of Shantung, was freely used by the Germans for military purposes. The crew of the Austrian cruiser "Kaiserin Elisabeth," who were on leave at Tientsin, were brought back to Tsingtao by means of that line, and war materials were incessantly transported into the fort by the same route. It was discovered that China not only winked at such acts of violation of her neutrality but actually gave aid and comfort to the Germans. Japan made protests to the Peking Government but to no purpose; she was constrained to take over the operation and the safeguarding of the railway. The second Japanese contingent began to land at Laoshan Bay, within the leased zone, on Sept. 18 and soon established touch with the I. Army. The Japanese forces under Gen. Kamio thus amounted to about 22,980 officers and men and they succeeded in some ten days in wresting from the Germans several of their advanced positions. On Sept. 24, there arrived at the arena of campaign the British force, commanded by Gen. Barnardiston, consisting of 910 officers and men of the 2nd South Wales Borderers and 450 of the 36th Sikhs. After permitting the non-combatants to leave the fortress, the general attack on the posi-

tion was commenced on Oct. 31, the Japanese blockading fleet off the harbour assisting by a continuous bombardment. On the morning of Nov. 7, white flags were descried on the forts of Moltke, Bismarck and Iltis, to the pleasant surprise of the attacking army, which had expected a protracted siege. After the fall of the stronghold, it was ascertained that all enemy ships, including the Austrian cruiser "Kaiserin Elisabeth," had been sunk in the port of Tsingtao. The Japanese army lost, during the campaign, 1,968 killed or wounded, and the Japanese navy a cruiser, a destroyer and a torpedo boat. The port of Kiaochow was reopened for trade by the Japanese on Dec. 28 1914.

*The Japanese Navy in the War.*—Although Tsingtao was thus early captured, there still remained the important task of locating and disposing of Admi. von Spee's squadron, consisting of the "Scharnhorst," the "Gneisenau," the "Nürnberg," the "Leipzig," and the "Dresden," which were seriously menacing the Allied commerce in the South Seas. It had further been reported that several German warships were at large in the Pacific Ocean. As early as Aug. 26, the battle cruiser "Ibuki" and the cruiser "Chikuma," and shortly afterwards six more Japanese cruisers, were ordered to join the British China Squadron under the command of Admi. Jerram. There were further dispatched a squadron of eight cruisers to the China and the East Seas and two squadrons—one comprising two battle cruisers, two cruisers, and a division of torpedo destroyers and the other one battleship and two cruisers—to the South Pacific Ocean. The cruiser "Idzumo," which happened to be in Mexican waters, as well as the "Asama" and the "Hizen," were entrusted with the patrol of the western coast of America, in coöperation with the Canadian "Rainbow" and the British cruiser "Newcastle."

In the middle of Sept., a great sensation was aroused by the dramatic appearance in the Bay of Bengal of the German raider "Emden," which had effected her egress from Tsingtao before the blockade was instituted by the Japanese navy. Several British merchantmen fell victims to her ruthless attack in appallingly swift succession, and it was only after two months' strenuous chase by the British and the Japanese squadrons that the "Emden" was sunk by the Australian cruiser "Sydney" near the island of Cocos. In the meantime, Australian and New Zealand troops were being hurried to various theatres of war in Europe, and Japanese warships assisted in the convoy of the transports across the Indian Ocean. At one time, whilst the "Emden" was still working havoc in Indian waters, the "Ibuki" was obliged to convoy no fewer than 38 troopships by herself. Apart from the anxious, as well as hazardous task of convoy, Japanese warships were, in Feb. 1915, called upon to hurry to Singapore and land troops there to assist the British forces, side by side with French and Russian marines, in suppressing a mutiny of Indian soldiers who had come under German influence. In 1917, and after, the Japanese navy undertook the guardianship of the safety of the Indian Ocean as far as the Cape of Good Hope. Von Spee's squadron, as a result of the concerted operation of the British and the Japanese navies, was chased in the direction of Cape Horn towards the end of 1914, and on Dec. 8 was encountered by Admi. Sturdee's squadron off the Falkland Is. and was completely annihilated, with the exception of the "Dresden," which, however, was also sunk by the British off Chile three months later. Meanwhile the German gunboat "Geier" was disarmed and interned at Honolulu, and thus the Pacific Ocean was cleared of the enemy, greatly to the relief of Allied commerce.

The next, and not the least important, contribution of the Japanese navy toward the successful conduct of the war, was the sending of the cruiser "Akashi" and three destroyer divisions under the command of Rear-Admi. Sato to the Mediterranean. The German submarine warfare was about that time beginning to be carried on in a ruthless manner, and the British navy had been earnestly requesting Japanese help. Whilst the British, French and Italian forces were engaged in blockading the Adriatic Sea and the Dardanelles, Admi. Sato's squadron assumed the all-important duties of convoying Allied vessels to and fro between ports in the Mediterranean. The Japanese destroyers successfully escorted 51 British warships, as well as 623 British, 100 French, 18 Italian and 26 other troopships or merchantmen, totalling 788 ships, and they cruised altogether 220,000 miles.

*Japan's "Twenty-one Demands" upon China.*—Friction between neighbours is deplorable, though far too common, but it is altogether exasperating when friction is caused by the neglect of order in the house of a neighbour. No one more regretted the continued internal troubles and disorder in China, which had been divided into two camps since the Republic was proclaimed, than Japan herself, whose national destiny is so intimately entwined with that of China. The Tokyo Cabinet became impatient toward the end of 1914, of the general trend of the Chinese-Japanese relations which, largely owing to China's procrastinating and wayward diplomacy, had been marked by constant and cumulative misunderstandings and irritations. In the judgment of the Okuma Cabinet the only effective move was an attempt to cleanse the Augean stable, and on Jan. 18 1915, with a view to liquidating all outstanding problems between Japan and China, the "twenty-one demands" were presented to President Yuan Shi-k'ai at the hands of Mr. Hioki, the Japanese minister in Peking. The demands consisted of five groups: Group I., which related to Shantung province, comprised four items; Group II., in respect of S. Manchuria and Eastern Inner Mongolia, had seven items; Group III. concerned the Hanyehping Co. and included two items; Group IV. consisted of one item relative to the territorial integrity of China. The V. Group was not presented as "demands" but as "wishes," consisting of seven items, covering the employment of Japanese advisers; land ownership by Japanese hospitals, temples and schools; the purchase of munitions of war from Japan; the right to construct a line connecting Wuchang with the Kiukang–Nanchang railway as well as the Nanchang–Hangchow and the Nanchang–Chaochow lines; the priority of Japanese capital regarding railways, mines and harbour works in Fukien province; and Japanese missionary propaganda. The too ambitious attempt of the Tokyo Cabinet evoked adverse criticisms from various quarters. But that was more on account of the manner in which the demands were made to China. It was undoubtedly unfortunate that, whatever cogent reasons there might have been, the "wishes" were not placed on the table from the outset as well as the "demands." As to their intrinsic merit, the London *Times* (Feb. 13 1915) observed: "Even in the Peking version . . . these terms do not look harsh or unreasonable in principle. . . . They do not in any wise threaten the integrity of China, nor do they appear to violate the doctrines of the equality of opportunity and of the open door as hitherto accepted by other Powers." Even granting that some of the proposals were unwisely conceived, the general belief that Japan purposed at that time to establish a veiled protectorate over China was merely the result of active and extensive hostile propaganda; no insinuation could be more malicious and misguided. For Japan it was a matter of superlative interest and importance that her neighbours should attain a good Government, a prosperous industry and a flourishing trade; it was her greatest fear that China should become the Turkey of the extreme Orient. Chagrined by the endless tergiversation of the Chinese Government, in entire disregard of Japan's friendly and conciliatory intentions, which were amply shown during the four months' negotiations at Peking, the Japanese Government pressed the Peking Government, on May 7 1918, to express their definite answer within a time limit. In the result the Chinese President, Yuan Shi-k'ai, acceded to the Japanese proposals; and on the 25th of the same month, under the signature of Mr. Hioki and Lu Cheng-Hsiang, the Chinese Minister for Foreign Affairs, two treaties were concluded—one respecting the province of Shantung, and the other regarding S. Manchuria and Eastern Inner Mongolia—and 13 notes were exchanged. The treaty respecting the province of Shantung stipulated that China should recognise all arrangements to be made between Japan and Germany as to the German rights in that province; that, for the construction in future of a railway connecting Chefoo or Lungkow with the Kiaochow–Tsinan railway, Japanese capitalists should first be approached; that China should of her own accord early open suitable cities and towns for

the residence and trading of foreigners. China further pledged herself in a note that she would not lease or alienate any part of Shantung, including the islands off its coast.

With special reference to Kiaochow, the Japanese Minister, in an exchange of notes, made the following declaration:—

"If upon the conclusion of the present war, the Japanese Government should be given an absolutely free disposal of the leased territory of Kiaochow Bay, they will return the said territory to China, subject to the following conditions:—

"1. Opening of the whole of Kiaochow as a commercial port;

"2. Establishment of a Japanese settlement in the locality to be designated by the Japanese Government;

"3. Establishment, if desired by the Powers, of an international settlement;

"4. Arrangements to be made, before the return of the said treaty is effected, between the Japanese and the Chinese Governments with respect to the disposal of German public establishments and properties and with regard to the other conditions and procedures."

By the treaty respecting S. Manchuria and Eastern Inner Mongolia, the Chinese Government engaged that the terms of lease of Port Arthur and Dairen, and of the S. Manchuria railway and the Antung–Mukden railway, should be extended to 99 years respectively; that Japanese should be permitted in S. Manchuria to lease land for residential, commercial, industrial and agricultural purposes, and further should be free to enter, travel, reside and pursue various vocations; that in Eastern Mongolia Japanese should be permitted to carry on, jointly with Chinese, agricultural undertakings; that Japanese conducting business in those regions should be submitted to Chinese police laws and taxation; that civil and criminal cases should be tried by the Japanese consul or by Chinese officials according as the defendant was Japanese or Chinese, save in cases of land disputes where a mixed tribunal would have the power of adjudication (all this pending the eventual reform of the Chinese judicial system); that suitable cities and towns would early be opened to foreigners of China's own accord; that various agreements relating to the Kirin–Changchun railway should early be revised. By the exchange of notes, certain mining rights, and the priority of Japanese capital in relation to loans for building railways and other loans on the security of taxes, save the salt gabelle and customs revenue, were granted to Japan. It was further agreed that Japanese might be employed first in case China needed foreign advisers or instructors in S. Manchuria. As to the Hanyehping Co., in view of the very close relations existing between Japanese capitalists and the company, China agreed to approve a possible future arrangement for its joint undertaking and further not to confiscate or nationalize it without Japan's consent, or let it contract foreign loans other than Japanese. In regard to the province of Fukien, the Chinese Government declared that they would not permit a foreign Power to build or finance any shipyard or military or naval establishment.

If Yuan Shi-k'ai had been disinterested and had taken a wider view of the general situation, those treaties and agreements could very well have been utilized for bringing China and Japan closer, and consolidating the peace of the East. But he was paving his way to his ambitious goal—to ascend the throne. It was unfortunate that Yuan's subsequent actions and proclamations inspired undue ill-will in the Chinese people.

*Japan's War Mission to the United States.*—Shortly after the declaration of war against Germany by the United States in April 1917, the Allied Powers sent their leading statesmen and soldiers to Washington to confer as to the best methods of coöperation in the war; how to coördinate their respective national strengths so as to bring about an early victory. Great Britain was represented by Mr. Balfour and France by M. Viviani and Marshal Joffre. Japan entrusted the mission to Viscount K. Ishii, whose major task was to consult about the distribution of the Allied naval forces, and the arrangement as to the exchange of ships and steel, for whereas America urgently needed transports to convey her troops to the western front, the Japanese steel plants and shipbuilding yards would shortly be forced to remain idle if they were unable to obtain a supply of American iron. During Viscount Ishii's stay in Washington, the Ishii-Lansing Agreement in regard to China was incidentally concluded.

*The Ishii-Lansing Agreement.*—In the course of conversation which took place between Mr. Robert Lansing, the United States Secretary of State, and Viscount Ishii, when the latter went to Washington on the Special War Mission in 1917, it was found advisable that a public announcement of the desires and intentions of the two Governments with regard to China should once again be made, "in order to silence mischievous reports" that had from time to time been circulated. On Nov. 2 notes were exchanged between the two plenipotentiaries, declaring:—

"The Governments of Japan and the United States recognize that territorial propinquity creates special relations between countries, and, consequently the Government of the United States recognizes that Japan has special interests in China, particularly in the part to which her possessions are contiguous.

"The territorial sovereignty of China, nevertheless, remains unimpaired, and the Government of the United States has every confidence in the repeated assurances of the Imperial Japanese Government that while geographical position gives Japan such special interests they have no desire to discriminate against the trade of other nations or to disregard the commercial rights heretofore granted by China in treaties with other Powers.

"The Governments of Japan and the United States deny that they have any purpose to infringe in any way the independence or territorial integrity of China and they declare, furthermore, that they always adhere to the principle of the so-called 'open door,' or equal opportunity for commerce and industry in China.

"Moreover, they mutually declare that they are opposed to the acquisition by any Government of any special rights or privileges that would affect the independence or territorial integrity of China or that would deny to the subjects or citizens of any country the full enjoyment of equal opportunity in its commerce and industry."

*The Japanese Expedition to Siberia.*—After the Russian Revolution in 1917, a unique and anomalous situation developed in Siberia owing to the conjunction effected by German and Austro-Hungarian prisoners-of-war with Bolshevik forces, the former assuming the practical command. These Teutonic-Bolshevik allies seriously threatened the safety of the Czechoslovak troops who had essayed through the only available route of Siberia to join the Allied armies fighting on the western front in France. The U.S. Government proposed to the Japanese Government in the early part of 1918 to dispatch an Allied contingent to Eastern Siberia to give succour to the helpless and distressed Czechoslovaks. To this Japan gave her assent, and in Aug. undertook to detail a contingent to Vladivostok; the United States and Great Britain also dispatched troops to Siberia. Early in Sept. Khabarovsk was captured by the Allied forces, and during the month of Oct. the Bolshevik influence in Eastern Siberia was signally diminished and the Czechoslovaks in the interior succeeded in re-establishing communication with their compatriots in the littoral districts. The Allied successes in Siberia endowed the anti-Bolshevists, rallying under the banner of Admi. Kolchak, with fresh power; and the orders of the Omsk Government, established in Nov. 1918, extended as far as the Ural regions by the end of that year. But in May 1919 the anti-Bolshevik forces sustained a crushing reverse at the hands of the Red army; and Admi. Kolchak's Government first removed from Omsk and then, toward the winter, to Chita. In the face of such unfavourable developments of affairs, Japan saw the necessity of early arriving at a definite understanding with the U.S. Government as to the future dispatch of reënforcements to Siberia. The Washington Government, however, responded in Jan. 1920 with a sudden decision to withdraw all the American troops and railway experts; first, because the repatriation of the Czechoslovak forces was about to be completed, and secondly because the very unstable situation in Siberia would render futile any military assistance to the attempt to establish an autonomous Russian Government in Siberia. The American Government further stated that if Japan would continue in her endeavours in Siberia single-handed, they had no objection whatever. In point of fact, the exigencies of the situation soon obliged Japan to send a reënforcement. But the Social Revolutionaries and the Bolshevists were in the spring of 1920 fast establishing ascendancy in Eastern Siberia, having their headquarters at Vladivostok, Verkhne Udinsk and Blagovyeshchensk—the three centres being more or less independent of each other. After the arrest and execution by Bolsheviste of

Adml. Kolchak in Feb. 1920, the only remaining reactionary leader was Gen. Semenoff, who had established his Government at Chita and had the whole province of Trans-Baikalia under his sway. In March 1920 a most sanguinary incident occurred at Nikolaievsk, capital of Sakhalin Province and situated on the river Amur; all the Japanese residents of that city, men, women and children, numbering 350, including Consul Ishida and his family, were murdered by the "Partisans," a Bolshevist guerrilla gang infesting the littoral regions. The Japanese Government declared on July 3 that as there existed no responsible administrative centre in Russia which could negotiate about the flagrant outrage on Japan's prestige at Nikolaievsk, the Japanese forces would occupy certain places in Sakhalin province, pending the establishment of a legitimate Government. At the same time, it was made known that Japanese contingents would soon be withdrawn, as in fact they were, from Trans-Baikalia, inasmuch as the Czechoslovak troops had been successfully assisted on their homeward journey (the last troops left Vladivostok in Sept. 1920), but that Vladivostok and Khabarovsk would still have to be garrisoned by a small military strength. Upon inquiry from the Washington Government, it was explained by the Japanese Government that Vladivostok was the prolific hatchery of Korean revolutionary plots, and further the safety of the Japanese residents had to be provided for, and that Khabarovsk was a point in close strategic relation with Nikolaievsk. As soon as signs became visible of the growing stability of Khabarovsk, in Sept., evacuation of that region was immediately started. Meantime, the Bolshevists at Verkhne Udinsk began to style themselves the "Far Eastern Republic," and in concluding an agreement as to the suspension of hostilities with the Japanese military authorities in July 1920, formulated a memorandum to the purport that the Republic would follow democratic and not communist principles of administration and would constitute itself a buffer state in the interests of a speedy resuscitation of peace and order in Siberia. Then the movement for the unification of the several "Governments" in Eastern Russia was started, and in Nov. the so-called Amalgamation Assembly at Chita declared the independence of the "Far Eastern Republic"—adopting the name at first conceived at Verkhne Udinsk—holding as its territory the Russian provinces E. of the Selenga river and professing anti-communist democracy as its basic political principle. The *coup d'état* carried out by the reactionary Kappelists in Vladivostok on May 26 1921 showed that the Siberian situation was still very unstable.

*Anti-Bolshevist Agreements.*—In view of the Siberian situation, military and naval agreements were concluded between the Governments of Tokyo and Peking in March 1918 for the purpose of coördinating the forces of the two countries to oppose the probable invasion by the Bolshevists from the Siberian direction. China inaugurated an Office for Joint Military Action under the directorship of Tuan Chijui, to give effect to the terms of the agreements, receiving from Japan a supply of capital to the amount of 20,000,000 yen for the upkeep of the forces and 33,000,000 yen for purchasing munitions of war. Whilst the arrangement proved to be of considerable service in impeding the Bolshevik advance to the S., the incidental increase in the power of Tuan's party—the Anfu Club—gave rise to considerable misgivings and misunderstandings, at the expense of Japan's good name. It was, therefore, decided by Japan in March 1919, to furnish no further supplies of money and arms. After the downfall of Tuan and his friends in July 1920, the Peking Cabinet expressed their desire to discontinue the pact, and, but for the unfortunate state of affairs in Eastern Siberia, it would have been early terminated. As it was, the annulment was agreed upon by Tokyo and Peking on Jan. 27 1922.

*Japan at the Peace Conference.*—At the Peace Conference in Paris in 1919, Japan was represented by Marquis (afterwards Prince) Saionzi; Baron (afterwards Viscount) Makino; Viscount (afterwards Count) Chinda; Mr. (afterwards Baron) K. Matsui; and Mr. (afterwards Baron) K. Ijuin. The plenipotentiaries went to France with the firm conviction, as Baron Makino had made unmistakably clear before he left Japanese shores, that the attitude of Japan at Paris should be, not so much to advance her own case before the comrade nations in the war, as to take counsel with them in the creation of a new world in which justice and humanity would reign supreme and which would assure an enduring peace. The first claim laid on the peace table by the Japanese delegates was for the recognition of racial equality. The public opinion of Japan demanded that, if a new era of righteousness and fairness was to be established and peace and good-will among men were to be assured for all time, one of the postulates should be the principle of the equal dignity of races. The Japanese nation had been deeply conscious of the discriminatory treatment meted out to its nationals in various parts of the world. It recognized that differences in ability, power and character among men always exist; but it appeared wrong that there should be inequality of opportunities—inequality before the law. The present state of human civilization having been achieved by a series of social, religious, political and economic emancipations, it seemed certainly to be time that racial emancipation should, in the interests of the real progress of civilization, be foreshadowed and approved at least in principle. The original Japanese proposal for insertion in the Covenant of the League of Nations read:—

"The equality of nations being a basic principle of the League of Nations, the High Contracting Parties agree to accord, *as soon as possible*, to all alien nationals of the states members of the league equal and just treatment in every respect, making no distinction, either in law or in fact, on account of their race or nationality."

In explaining the Japanese position, Baron Makino made it clear "that the question being of a very delicate and complicated nature involving the play of a deep human passion, the immediate realization of the ideal equality was not proposed, but that the clause presented enunciated the *principle* only and left the actual working of it in the hands of the different Governments concerned." Every national of the States in the League was expected "to share military expenditure for the common cause and, if need be, sacrifice his own person. In view of these new duties . . . arising before him. . . each national would naturally feel, and in fact demand, that he be placed on an equal footing with the people whom he undertook to defend even with his own life." The Japanese proposal, which was later somewhat modified in terminology in an attempt to meet objections, obtained 11 votes out of 17 in its favour, but it was ruled that unanimity was necessary. Japan abided by that decision, reserving the right to raise the question again at an opportune moment.

The disposition as regards Kiaochow was the next question with which the Japanese delegates had to grapple. When the Japanese people gave a hearty send-off to their plenipotentiaries, they had no shadow of doubt as to the final issue of this question. The greater, therefore, was their disappointment, if not stupefaction, when the Chinese delegates came out with a demand for the direct restitution of the ex-German stronghold. Japan claimed Kiaochow in recognition of all her military and naval services, by which, with British assistance, the German Far Eastern base had been reduced, by which trade routes in the Orient had been kept unmolested and by which Allied troopships had safely been convoyed to various fronts. It was at the same time made clear that Japan would be content, having once secured Kiaochow in her hand, not to retain it in her possession, but to offer it to China as a mark of good-will and friendship. "A cordial friendship between Japan and China" had been a slogan on the lips of thinking Japanese, and it was expected that a new leaf in Japanese-Chinese relations would be turned by this timely offering. The Chinese delegates, however, insisted that the declaration of war by China against Germany on Aug. 14 1917 had abrogated all her treaties with Germany, including that of the lease of Kiaochow. Whether a lease treaty is not a sort of *pacta transitoria* is, to say the least, a moot question; it would appear to be contrary to common sense to contend that a paper declaration of war could constitute a magic wand to transfer to her possession a formidable fortress which China could never have reduced with her own resources, and which, if it had not been captured beforehand, would have been a potential

intimidation, and would possibly have prevented her making that very declaration. China's further plea was that her engagement of May 1915 (see p. 653, the *Twenty-one Demands*) had been made under duress and was therefore null and void. It is a fact, however, that China did not question the validity of that engagement, when she willingly concluded the formal understanding of Sept. 24 1918, which was actually based on the above-mentioned agreement of May 1915, and accepted an advance of 20,000,000 yen under that understanding. The position of Japan, it should be observed, had furthermore been fortified by the previous undertakings of Great Britain, France, Russia and Italy in 1917, to support or at least raise no objection to the Japanese claim.

The Supreme Council finally decided in favour of Japan, on May 5 1919 (Arts. 156–158, Treaty of Versailles). Rumours were in circulation that Japan had struck a bargain between the race question and the Shantung dispute; and further, that the withdrawal of Italy from the Peace Conference had made for Japan's strength. The latter surmise may have been true in a certain measure, but the former was hopelessly wide of the mark.

The ex-German islands in the Pacific lying N. of the Equator, which had been under the Japanese occupation since 1914, were allocated to the Japanese administration under the newly formulated mandatory system, at the Supreme Council held at the Trianon Palace on May 7 1919. They include the Marshall, Caroline, Palau (Pelew), and Marianne (Ladrone) islands.

*The Restitution of Kiaochow.*—With the coming into force of the Treaty of Versailles on Jan. 10 1920, the German rights and interests in Shantung passed to the hands of Japan, and the Tokyo Government, in conformity with their pledged obligation to China, and true to their repeated public avowals (by Baron Makino in Paris on May 4 1919; by Viscount Uchida in Tokyo, May 17 and Aug. 2 1919), immediately instructed Minister Obata to invite the Peking Government to open negotiations for effecting the restitution of the ex-German possessions in Shantung (Jan. 19). It was desired that the necessary preparations for accepting the restoration should forthwith be started, and that China should organize a police force to take over the charge of guarding the Tsinan–Kiaochow railway. As soon as such an organization was completed—even if it were prior to an agreement being reached as to the restoration—the Japanese troops would be immediately withdrawn. Three months passed without any response from Peking to the Japanese overtures. Japan repeated on April 26 her desire to start negotiations, and the Chinese reply (May 22) was that she could not conduct direct negotiations with Japan as to the question of Tsingtau on the basis of the Treaty of Versailles, which she did not sign, and further, that the whole public of China had assumed a strongly antagonistic attitude in respect of the question. Whereupon the Tokyo Government asked the Chinese Government to reconsider the matter, assuring the latter that they were ready to commence negotiations at any time China might deem convenient. But Peking again remained deaf. It was then rumoured that the question might be brought up by the Chinese delegation before the First Assembly of the League of Nations at Geneva in Nov. and Dec. 1920. No direct mention of the question was made; but Dr. Koo reserved for "a more appropriate time in the future," the matter of bringing before the League certain "subjects of vital interest to China, affecting international relations."

*The Yap Controversy.*—The Council of the League which met in Geneva on Dec. 17 1920, decided upon the statute relative to "C" class mandates, under the terms of the Covenant of the League (Art. 22, 6) and pursuant to the decision of the Supreme Council on May 7 1919, allocating the ex-German South Sea islands to Great Britain, Australia, New Zealand and Japan. The Japanese Government had been contending that, according to their legal interpretation, the principle of equal opportunities for trade and commerce should, under the Covenant, be assured to "C" class as well as to "B" class mandates (Art. 22, 5). But in view of the importance of unity and coöperation among the Allied nations, Japan gave her assent to the issue of the statutes, on the understanding that "that decision should not be considered as an acquiescence by the Japanese Government in the submission of Japanese subjects to discriminatory and disadvantageous treatment in the mandated territories, nor have they thereby discarded their claim that the rights and interests hitherto enjoyed by Japanese subjects in these territories should be fully respected."

To the statute relative to the islands N. of the Equator which came under the Japanese mandate, "as an integral portion of its territory," the United States took exception, on the plea that the island of Yap should not be included in the islands to be so assigned. It was argued that President Wilson had submitted to the Supreme Council his proposal of having that island internationalized for reasons vitally affecting the world communications, and that its decision, published on May 7 1919, should not be regarded as by any means conclusive. Further, the Washington Government declared that they had never ratified the Treaty of Versailles and accordingly were not bound by that instrument in any sense; but the United States should, treaty or no treaty, have a voice in the disposition of the affairs immediately arising from the World War. So far as the status of the island was concerned, Japan's position was that, if the published decision of the Supreme Council were not final, she did not know what she could rely upon as definite finality; the Allied powers in Europe appeared to support the Japanese view. In the presentation of their case, the American Government further stated that "even if Yap should be assigned under mandate to Japan, all other Powers should have free and unhampered access to the island for the landing and operation of cables." Japan contended that "the (cables) question seems to be one which should be freely settled by the nation which has the charge of the place." As the result of the Washington Conference at the end of 1921, an agreement between Japan and the United States was eventually signed on Dec. 12, by which Japan's sovereignty (as the mandatory Power) in Yap was admitted by the United States, while Japan accorded to the United States full rights and facilities in connexion with the cables and other matters.

*The European Tour of the Crown Prince.*—The Crown Prince Hirohito broke the age-long tradition of Japan's history, and, as the first heir to the throne to leave his native shores, set forth early in March 1921, in company with Prince Kan-in, and escorted by Count Chinda, ex-ambassador to the court of St. James's, upon a tour of study and observation in Europe. Prior to his departure, the more conservative section of the Japanese public, including some influential leaders in politics, gave vent to their anachronistic, though loyal, solicitude as to the safety of the Prince in risking such an unprecedented adventure, the reported indifferent health of the Emperor also inspiring anxiety in many uneasy minds. To add fuel to the popular disquietude a rumour was in circulation that the betrothal between the Crown Prince and Princess Nagako of Kuni might be cancelled, and this development was even attributed to political reasons; a timely *dementi*, however, was issued by the Imperial Household. The battleship "Katori," with the Crown Prince on board, called at Hong-Kong, Singapore, Bombay, Port Said, Malta and Gibraltar, en route to Portsmouth, where she anchored on May 8. The reception by the King and the public of Great Britain was most cordial and spontaneous, befitting the Alliance uniting the two nations for the past two decades. The Crown Prince, leaving for France on May 29, said in his farewell message to the British nation: "It has been my happiness to see something of almost every side of the national life and institutions of the British people." The Imperial tour extended to France, Belgium, Holland and Italy. As to the United States of America, the Crown Prince had occasion to say that he much regretted he could not visit that country on this trip, but that he still hoped to do so in the not far distant future. (H. SA.)

**JASTROW, MORRIS** (1861–1921), American orientalist, was born in Warsaw, Russian Poland, Aug. 13 1861, but went to Philadelphia at the age of five. Educated at the schools of that city and in the university of Pennsylvania, he studied subsequently at the universities of Leipzig and Breslau, Paris and Strassburg until 1885, when he returned to the university of

Adml. Kolchak in Feb. 1920, the only remaining reactionary leader was Gen. Semenoff, who had established his Government at Chita and had the whole province of Trans-Baikalia under his sway. In March 1920 a most sanguinary incident occurred at Nikolaievsk, capital of Sakhalin Province and situated on the river Amur; all the Japanese residents of that city, men, women and children, numbering 350, including Consul Ishida and his family, were murdered by the "Partisans," a Bolshevist guerrilla gang infesting the littoral regions. The Japanese Government declared on July 3 that as there existed no responsible administrative centre in Russia which could negotiate about the flagrant outrage on Japan's prestige at Nikolaievsk, the Japanese forces would occupy certain places in Sakhalin province, pending the establishment of a legitimate Government. At the same time, it was made known that Japanese contingents would soon be withdrawn, as in fact they were, from Trans-Baikalia, inasmuch as the Czechoslovak troops had been successfully assisted on their homeward journey (the last troops left Vladivostok in Sept. 1920), but that Vladivostok and Khabarovsk would still have to be garrisoned by a small military strength. Upon inquiry from the Washington Government, it was explained by the Japanese Government that Vladivostok was the prolific hatchery of Korean revolutionary plots, and further the safety of the Japanese residents had to be provided for, and that Khabarovsk was a point in close strategic relation with Nikolaievsk. **JELLINEK, GEORGE** (1852–1911), Hungarian jurist (*see* 15.315), died at Heidelberg Jan. 12 1911.

**JENSEN, WILHELM** (1837–1911), German author (*see* 15.321), died at Munich Nov. 24 1911. His later works include *Die Fränkische Leuchte* (1901); *Vor der Elbmündung* (1905); *Unter der Tarnkappe* (1906); and *Fremdlinge unter den Menschen* (1911).

See J. A. Erdmann, *Wilhelm Jensen, sein Leben und Dichten* (1907); W. Barchfeld, *Wilhelm Jensen als Lyriker* (1913).

**JESSOPP, AUGUSTUS** (1823–1914), British archaeologist and author, was born Dec. 20 1823 at Cheshunt. He was educated at St. John's College, Cambridge, of which he was afterwards elected fellow. He was also hon. fellow of Worcester College, Oxford, and a select preacher of that university in 1896. His first curacy was at Papworth St. Agnes, Cambs., but the greater part of his life was given up to teaching, as headmaster of Helston grammar school from 1855 to 1859 and of King Edward VI. school, Norwich, 1859–79. He was rector of Scarning, Norf., from 1879 to 1911 and during most of that time he acted as chaplain in ordinary to King Edward VII. Besides some archaeological articles in the *Nineteenth Century* and contributions to the *Dictionary of National Biography*, he published a *History of the Diocese of Norwich* (1879); *The Coming of the Friars* (1885); *The Autobiography of Roger North* (1887) and *Trials of a Country Parson* (1890). He died at Scarning Feb. 12 1914.

**JEX-BLAKE, SOPHIA** (1840–1912), English medical practitioner, was born in 1840. In 1858–61 she was mathematical tutor at Queen's College, London. She subsequently set out on a tour of inspection of girls' education institutions, and in America became a pupil of Dr. Elizabeth Blackwell. In 1866 Miss Jex-Blake began a course of study in Boston under Dr. Lucy Sewall. In 1868 she returned to England and applied to the university of London for admission to their medical examinations. Being refused, she returned to the university of Edinburgh and was told that they could not admit one lady only. She got others to join her, and finally in 1869 they were admitted to classes, and in 1870 to the hospitals, though here they encountered much riotous hostility from a section of the male students. The university, however, still refused to allow graduation, and after some legal proceedings and much expense Miss Jex-Blake in 1874 went to London, where she took a leading part in establishing the London School of Medicine for Women. In 1877 this was associated with the Royal Free Hospital, and in the same year Miss Jex-Blake obtained the M.D. degree of Bern. She was also admitted a licentiate of the College of Physicians, Dublin, and member in 1880. She began practice in Edinburgh in 1878 and opened a dispensary there for women and children. In 1886 she founded the Edinburgh School of Medicine for Women. She retired in 1899. Besides various medical works she published *Medical Women* (1872) and *American Schools and Colleges* (1886). She died at Mark Cross, Sussex, Jan. 7 1912. Her niece Katherine (b. 1860) became mistress of Girton College, Cambridge, in 1916, and another niece, Henrietta (b. 1862), became principal of Lady Margaret Hall, Oxford, in 1999. Both retired in 1921.

**JIREČEK, HERMENEGILD,** RITTER VON SAMAKOW (1827–1909), Bohemian jurisconsult (*see* 15.417), died in 1909; and KONSTANTIN JOSEF JIREČEK (1854–1918), archaeologist and historian, died in 1918.

**JOFFRE, JOSEPH JACQUES CÉSARE** (1852– ), marshal of France, was born at Rivesaltes (Pyrénées-Orientales) on Jan. 12 1852. While he was still a student at the École Polytechnique the Franco-German War broke out. He was given a temporary appointment as a sub-lieutenant and was employed with the artillery engaged in the defence of Paris. On the signing of peace he returned to the École Polytechnique to complete his course, and on Sept. 21 1872 was given a permanent appointment as a lieutenant in the engineers. In April 1876 he became a captain and was posted to a railway works company; after three years spent on the defence works of Paris, he returned to regimental duty in 1879. In 1885 he took part in the expedition to Formosa, and for his services was (Sept. 7 1885) made a chevalier of the Legion of Honour. From Formosa he went, as chief engineer, to Hanoï, and became responsible for the organization of the defences of Upper Tonkin. He returned to France in July 1888 and was attached for duty to the department of the inspector of engineers (War Office). Promoted commandant in May 1889 he next served for two years at Versailles with a railway operating unit. In 1892 he was seconded for service under the colonial administration, and was sent to the Sudan in order to direct the works on the Senegal–Niger railway. While in the Sudan he greatly distinguished himself in command of the force which made the brilliant and audacious march to Timbuctoo to relieve the ambushed Bonnier column, and was made a lieutenant-colonel (March 6 1894) and an officer of the Legion of Honour (Dec. 26 1894). In 1896 he returned from the Sudan and became secretary to the Military Inventions Commission, a post which he continued to hold after his promotion to colonel in Aug. 1897. Four years later he was—while serving in Madagascar under Galliéni—made a general of brigade and was appointed to command the 19th Artillery Bde. at Vincennes. He was at the same time made a member of the *Comité technique du génie*. In 1903 he became director of engineers at the War Office, and was promoted a commander of the Legion of Honour. He was made a general of division on March 24 1905, and then successively held appointments as military governor of Lille, commander of a division, permanent inspector of schools, commander of the II. Corps (Amiens), and member of the *conseil supérieur de la guerre*.

On first being nominated to the *conseil supérieur de la guerre* Joffre was designated, in case of war, to be head of the administrative and lines-of-communication services, for which task his varied experience evidently fitted him. When, however, disputes arose between the generalissimo designate, Michel, and the general staff as to the plan of campaign to be prepared for, Joffre was selected to succeed Michel, after Pau had declined the office and Galliéni had been set aside on account of age. The appointment was a surprise, as Joffre was a "colonial" and an administrator who was not familiar with the particulars of the one problem which the generalissimo might be required to solve. It was intended to give him as assistant Castelnau, a "metropolitan" soldier thoroughly versed in the details of European staff work. Castelnau however, probably on account of his clerical connexions and sympathies, was set aside, and when Aug. 1914 came Joffre's staff was constituted entirely of men of a younger generation, amongst whom Berthelot at once took the lead. Covered by his authority, it was they who conducted the offensive into Lorraine, the battle of the frontiers, and the retreat that followed. Joffre himself, by nature and through experience, was essentially a man of authority, and, feeling perhaps that the greatest need of the army and the nation in the crisis was confidence in the leader as leader, he gave himself up entirely to the act of commanding. His operations bureau indicated when and where the armies should move and fight; he himself displayed ceaseless activity to ensure that they did so. Thus, while for want of energetic command the victorious German offensive was breaking up, the French retreat, in Joffre's strong hands, became more and more coherent, till finally, when Galliéni's initiative began the counter-stroke of the Ource, by a supreme act of command Joffre bade the retreating army turn about and take the offensive, and was obeyed. Earlier disasters and the stabilization of the Germans in the heart of northern France were forgotten in gratitude for the Marne, and in Dec. 1914 Joffre's prestige at home and abroad was higher than that of any living man. Those who knew the inner history of the crisis were even less inclined than the rest to diminish this prestige, as it seemed that Joffre possessed the secret that had escaped all the general staffs, that of effectively commanding an army of two million citizen soldiers spread over an immense front. Moreover, that prestige was considered essential to the realization of the project of centralizing the command of all Entente forces in French hands.

During 1915, however, when Joffre and his G.H.Q. had settled down to a trench warfare for which they were not prepared, criticism began to make itself felt, especially as to the aloofness of G.H.Q. from the front, its arbitrary methods,

Adml. Kolchak in Feb. 1920, the only remaining reactionary leader was Gen. Semenoff, who had established his Government at Chita and had the whole province of Trans-Baikalia under his sway. In March 1920 a most sanguinary incident occurred at Nikolaievsk, capital of Sakhalin Province and situated on the river Amur; all the Japanese residents of that city, men, women and children, numbering 350, including Consul Ishida and his family, were murdered by the "Partisans," a Bolshevist guerrilla gang infesting the littoral regions. The Japanese Government declared on July 3 that as there existed no responsible administrative centre in Russia which could negotiate about the flagrant outrage on Japan's prestige at Nikolaievsk, the Japanese forces would occupy certain places in Sakhalin province, pending the establishment of a legitimate Government. At the same time, it was made known that Japanese contingents would soon be withdrawn, as in fact they were, from Trans-Baikalia, inasmuch as the Czechoslovak troops had been successfully assisted on their homeward journey (the last troops left Vladivostok in Sept. 1920), but that Vladivostok and Khabarovsk would still have to be garrisoned by a small military strength. Upon inquiry from the Washington Government, it was explained by the Japanese Government that Vladivostok was the prolific hatchery of Korean revolutionary plots, and further the safety of the Japanese residents had to be provided for, and that Khabarovsk was a point in close strategic relation with Nikolaievsk. As soon as signs became visible of the growing stability of Khabarovsk, in Sept., evacuation of that region was immediately started. Meantime, the Bolshevists at Verkhne Udinsk began to style themselves the "Far Eastern Republic," and in concluding an agreement as to the suspension of hostilities with the Japanese military authorities in July 1920, formulated a memorandum to the purport that the Republic would follow democratic and not communist principles of administration and would constitute itself a buffer state in the interests of a speedy resuscitation of peace and order in Siberia. Then the movement for the unification of the several "Governments" in Eastern Russia was started, and in Nov. the so-called Amalgamation Assembly at Chita declared the independence of the "Far Eastern Republic"—adopting the name at first conceived at Verkhne Udinsk—holding as its territory the Russian provinces E. of the Selenga river and professing anti-communist democracy as its basic political principle. The *coup d'état* carried out by the reactionary Kappelists in Vladivostok on May 26 1921 showed that the Siberian situation was still very unstable.

*Anti-Bolshevist Agreements.*—In view of the Siberian situation, military and naval agreements were concluded between the Governments of Tokyo and Peking in March 1918 for the purpose of coördinating the forces of the two countries to oppose the probable invasion by the Bolshevists from the Siberian direction. China inaugurated an Office for Joint Military Action under the directorship of Tuan Chijui, to give effect to the terms of the agreements, receiving from Japan a supply of capital to the amount of 20,000,000 yen for the upkeep of the forces and 33,000,000 yen for purchasing munitions of war. Whilst the arrangement proved to be of considerable service in impeding the Bolshevik advance to the S., the incidental increase in the power of Tuan's party—the Anfu Club—gave rise to considerable misgivings and misunderstandings, at the expense of Japan's good name. It was, therefore, decided by Japan in March 1919, to furnish no further supplies of money and arms. After the downfall of Tuan and his friends in July 1920, the Peking Cabinet expressed their desire to discontinue the pact, and, but for the unfortunate state of affairs in Eastern Siberia, it would have been early terminated. As it was, the annulment was agreed upon by Tokyo and Peking on Jan. 27 1922.

*Japan at the Peace Conference.*—At the Peace Conference in Paris in 1919, Japan was represented by Marquis (afterwards Prince) Saionzi; Baron (afterwards Viscount) Makino; Viscount (afterwards Count) Chinda; Mr. (afterwards Baron) K. Matsui; and Mr. (afterwards Baron) K. Ijuin. The plenipotentiaries went to France with the firm conviction, as Baron Makino had made unmistakably clear before he left Japanese shores, that the attitude of Japan at Paris should be, not so much to advance her own case before the comrade nations in the war, as to take counsel with them in the creation of a new world in which justice and humanity would reign supreme and which would assure an enduring peace. The first claim laid on the peace table by the Japanese delegates was for the recognition of racial equality. The public opinion of Japan demanded that, if a new era of righteousness and fairness was to be established and peace and good-will among men were to be assured for all time, one of the postulates should be the principle of the equal dignity of races. The Japanese nation had been deeply conscious of the discriminatory treatment meted out to its nationals in various parts of the world. It recognized that differences in ability, power and character among men always exist; but it appeared wrong that there should be inequality of opportunities—inequality before the law. The present state of human civilization having been achieved by a series of social, religious, political and economic emancipations, it seemed certainly to be time that racial emancipation should, in the interests of the real progress of civilization, be foreshadowed and approved at least in principle. The original Japanese proposal for insertion in the Covenant of the League of Nations read:—

"The equality of nations being a basic principle of the League of Nations, the High Contracting Parties agree to accord, *as soon as possible*, to all alien nationals of the states members of the league equal and just treatment in every respect, making no distinction, either in law or in fact, on account of their race or nationality."

In explaining the Japanese position, Baron Makino made it clear "that the question being of a very delicate and complicated nature involving the play of a deep human passion, the immediate realization of the ideal equality was not proposed, but that the clause presented enunciated the *principle* only and left the actual working of it in the hands of the different Governments concerned." Every national of the States in the League was expected "to share military expenditure for the common cause and, if need be, sacrifice his own person. In view of these new duties . . . arising before him. . . each national would naturally feel, and in fact demand, that he be placed on an equal footing with the people whom he undertook to defend even with his own life." The Japanese proposal, which was later somewhat modified in terminology in an attempt to meet objections, obtained 11 votes out of 17 in its favour, but it was ruled that unanimity was necessary. Japan abided by that decision, reserving the right to raise the question again at an opportune moment.

The disposition as regards Kiaochow was the next question with which the Japanese delegates had to grapple. When the Japanese people gave a hearty send-off to their plenipotentiaries, they had no shadow of doubt as to the final issue of this question. The greater, therefore, was their disappointment, if not stupefaction, when the Chinese delegates came out with a demand for the direct restitution of the ex-German stronghold. Japan claimed Kiaochow in recognition of all her military and naval services, by which, with British assistance, the German Far Eastern base had been reduced, by which trade routes in the Orient had been kept unmolested and by which Allied troopships had safely been convoyed to various fronts. It was at the same time made clear that Japan would be content, having once secured Kiaochow in her hand, not to retain it in her possession, but to offer it to China as a mark of good-will and friendship. "A cordial friendship between Japan and China" had been a slogan on the lips of thinking Japanese, and it was expected that a new leaf in Japanese-Chinese relations would be turned by this timely offering. The Chinese delegates, however, insisted that the declaration of war by China against Germany on Aug. 14 1917 had abrogated all her treaties with Germany, including that of the lease of Kiaochow. Whether a lease treaty is not a sort of *pacta transitoria* is, to say the least, a moot question; it would appear to be contrary to common sense to contend that a paper declaration of war could constitute a magic wand to transfer to her possession a formidable fortress which China could never have reduced with her own resources, and which, if it had not been captured beforehand, would have been a potential

and all departments were established there except those of graduate chemistry, medicine and hygiene. On the resignation in Jan. 1913 of Dr. Remsen, Dr. Frank J. Goodnow, who had been associated with the faculty of Columbia since 1883, took his place as president in Oct. 1914.

The faculty in 1920 numbered 380, the students 3,300, as against 175 faculty members and 683 students in 1907. In 1920 the library contained 226,000 bound volumes. In 1909 college courses were established for teachers and others (both men and women), given at afternoon and evening hours and on Saturday mornings, and leading to the degrees of Bachelor of Science and Bachelor of Arts. Summer courses, graduate and collegiate, work in which is credited towards various degrees, were inaugurated in 1911, and in 1916 evening classes were added under the title "courses in business economics" and "courses for technical workers," the latter conducted by the engineering department. These are open to men and women. By Act of the Maryland Legislature the department of engineering was established in 1912. This provided four-year courses in civil, electrical and mechanical engineering and in chemistry, as well as advanced graduate courses.

In June 1916, the Rockefeller Foundation of New York notified the university that the Foundation was prepared "to coöperate with the University in the establishment of a School of Hygiene and Public Health for the advancement of knowledge and the training of investigators, teachers, officials and other workers in these fields." The offer was accepted. Dr. William H. Welch was appointed director and Dr. William H. Howell was named to assist in the work of organization and administration. The main objects of the school were to establish courses for the training of qualified persons for public health work, to promote investigative work in hygiene and preventive medicine and to provide opportunities for the training of investigators in these subjects. Men and women are admitted on the same terms.

**JOHNSON, HIRAM WARREN** (1866– ), American politician, was born at Sacramento, Cal., Sept. 2 1866. He entered the university of California but did not finish his course. He became a reporter, at the same time studying law in his father's office; was admitted to the bar in 1888; and practised with his father and his brother in Sacramento. In 1902 he established his office in San Francisco, where he became widely known for the vigour and success with which, as prosecuting attorney, he proceeded against dishonest public officials and corporations. He was elected governor of California for the term 1911–5; and in 1912 was an unsuccessful candidate for vice-president (on the ticket with Theodore Roosevelt), as the nominee of the short-lived National Progressive party, which he had helped to organize. As governor he signed in 1913 the Webb anti-alien bill, designed to prohibit the ownership of land in California by Japanese, although the President had asked for delay. He was reëlected governor 1915–9 but resigned in 1917, having been elected a U.S. senator. He opposed many of the policies of President Wilson's administration and declared that a league of nations would involve the United States in European wars. At the Republican National Convention in 1920 he had considerable support as presidential candidate, especially from those opposed to the League of Nations and the Treaty of Peace as submitted to the Senate.

**JOHNSTON, SIR HENRY HAMILTON** (1858– ), English administrator and writer (*see* 15.473), has published in recent years *A History of the British Empire in Africa* (1910); *The Negro in the New World* (1910); *The Opening-up of Africa* (1911); *Pioneers in West Africa* (1911–3) and *Comparative Study of the Bantu and Semi-Bantu Languages* (vol. i., 1919). He has also come forward as a novelist. *The Gay-Dombeys* (1919) was an attempt to follow up the subsequent lives of some of Dickens's characters, and he employed the same method in *Mrs. Warren's Daughter* (1920), a "continuation" of G. B. Shaw's play, *Mrs. Warren's Profession.*

**JONES, EMILY ELISABETH CONSTANCE** (1848– ), English educator, was born at Langstone Court, Hereford., in 1848. She was educated partly privately and partly at a school in Cheltenham, and afterwards went to Girton College, Cambridge, where she took a first-class in the moral sciences tripos in 1880. In 1884 she was appointed a resident lecturer at Girton, and in 1896 became vice-mistress of the college. She became mistress of Girton in 1903, and in 1916 retired.

Miss Jones published various works on moral science, including *Elements of Logic as a Science of Propositions* (1890); *Primer of Logic* (1905); *Primer of Ethics* (1909); and *A New Law of Thought and its Logical Bearings* (1911). She also, with Miss E. Hamilton, translated Lotze's *Mikrokosmus* (1885), and has edited (1902) Henry Sidgwick's *Lectures on T. H. Green, Herbert Spencer and J. Martineau.*

**JONES, HENRY ARTHUR** (1851– ), English dramatist (*see* 15.498), produced subsequently to 1910 *The Ogre* (1911); *The Divine Gift* and *Mary Goes First* (both 1913); *The Lie* (1914) and *Cock o' the Walk* (1915), both produced in America; and *The Pacifists*, a war play produced at the St. James's theatre, London, in 1917. He also published some notable essays on patriotism and on education, and in 1920–1 carried on a vigorous newspaper polemic against Bolshevism and against the views of Mr. H. G. Wells and Mr. Bernard Shaw.

**JONES, THOMAS RUPERT** (1819–1911), English geologist (*see* 15.500), died at Chesham, Bucks., April 13 1911.

**JOSEPH,** former Archduke of Austria (1872– ), Austro-Hungarian field-marshal, was born at the château of Alcsuth in Hungary May 24 1872. The prince belongs to the "Hungarian branch" of the House of Habsburg-Lorraine, and is a nephew of the last Palatine of Hungary, the Archduke Stephen. In his military career Joseph of Habsburg took over at the outbreak of the World War the post of commander of the 31st (Budapest) Div. of infantry. He fought against Serbia, then in the Carpathians, and in Poland against Russia; subsequently he commanded the IX. Corps in nine battles on the Isonzo, then commanded on the Russian front, extending from the S.E. corner of Transylvania along the ridges of the Carpathians as far as the Upper Theiss, and finally was leader of the V. Army against Italy. He displayed conspicuous personal bravery, and understood in a remarkable degree how to attach the troops to his person. During the reign of the Emperor-King Charles the Archduke Joseph repeatedly took a prominent part in politics. At the outbreak of the revolution he conducted negotiations, as *homo regius*, between King Charles and the Karolyi party (*see* HUNGARY). After the fall of the Soviet Republic he was at first made Regent of Hungary (Aug.–Sept. 1919), but was compelled to retire owing to the intervention of the Entente Powers, who would not permit any Habsburg to hold a commanding position in Hungary. He married in 1803 the Princess Augusta of Bavaria and has continued to live in Hungary.

**JUTLAND, BATTLE OF.**—The battle of Jutland (known to the Germans as the battle of Skagerrak), fought between the British Grand Fleet and the German High Sea Fleet on May 31 1916, round a position in lat. 57° N., long. 6° E., 75 m. from the coast of Denmark, was the one great fleet action during the World War.

The appointment of Vice-Adml. Reinhold Scheer to command the German High Sea Fleet in Jan. 1916 was the harbinger of a more offensive naval policy on the German side. The temporary cessation of their submarine operations in April 1916, following on the American note of April 18, set free a number of German submarines for fleet operations, and Scheer devised a plan for the High Sea Fleet to appear off the Norwegian coast in the hope that the British fleet would put to sea and be attacked by submarines lying in wait for it. With this object in view, 14 submarines were despatched to the Dutch coast and took up their position as follows:—Off Scapa U44, U43; off Kinnaird Head U47; off the Forth U66, U63, U51, U32, U70, U24, U52; off the Tyne U24; off the Humber UB22, UB21; off the Dogger Bank U67. Their movements had not escaped notice. The British Admiralty was on the alert. Indications derived from wireless directionals pointed to some exceptional undertaking, and in the afternoon of May 30 the C.-in-C. was warned of the probability of the High Sea Fleet coming out. The Grand Fleet at the time was in three divisions. Adml. Jellicoe was at Scapa with the main body, comprising the 1st and 4th Battle Squadrons, the 3rd B.C.S., the 2nd C.S. and three destroyer flotillas. The 2nd B.S. and 1st C.S. were at Cromarty. Beatty with the battle cruisers and 5th B.S. was in the Forth. The order to prepare for sea went out at 5:40 P.M. The Cromarty detachment was ordered to join the battle fleet at sea, and by 10 P.M. the battle fleet had passed Hoxa gate on its way to a rendezvous in lat. 57° 45′ N., long. 4° 15′ E., 240 m. from Scapa. Beatty had received orders to pro-

ceed to a position in lat. 56° 40′ N., long. 5° E., and by midnight the whole British fleet was at sea, making swiftly for the Bight.

Never had so mighty an array been marshalled under one command as that which was led by Adml. Jellicoe. One hundred and fifty-one pennants were flown, with the flags of 15 admirals, and the ships comprised 28 dreadnoughts, 9 battle cruisers, 9 cruisers, 22 light cruisers and 82 destroyers. Forty more destroyers might have been added, but for the fact that the Harwich flotillas were retained in harbour, straining at their leash. Commodore Tyrwhitt the next day, seeing the battle signals coming in, put to sea after them, but was ordered back to harbour in spite of a promise made by the C.-in-C. in Nov. 1914 that his flotillas should reënforce the Grand Fleet when word arrived that an action was imminent. The word arrived at 4:51 P.M. on May 31, but the Harwich force was not sent.

Vice-Adml. Hipper, commanding the German advance force, had left the Jade at 2 A.M. and was followed half an hour later by the German battle fleet. Though inferior to the British, it mustered 16 dreadnoughts, 6 pre-dreadnoughts, 5 battle cruisers, 11 light cruisers and 72 destroyers. Mine-sweepers had cleared the way for it past Amrum Bank, and Adml. Hipper proceeded N. with orders to show himself off the Skagerrak before dark, cruise there during the night, and join the main fleet the next day.

The constitution of the British fleet was in detail as follows:—

### MAIN BODY

Fleet Flagship, "Iron Duke"
(C.-in-C., Adml. Sir John Jellicoe; Chief of Staff, Vice-Adml. Sir Chas. Madden), with attached destroyers "Oak," "Abdiel."

2ND B.S. (Vice-Adml. Sir Thos. H. Jerram):

*1st Div.:*
"King George V." (flag),
"Ajax,"
"Centurion,"
"Erin"
(all 10 13·5-in.).

*2nd Div.:*
"Orion" (Rear-Adml. A. C. Leveson),
"Monarch,"
"Conqueror,"
"Thunderer"
(all 10 13·5-in.).

4TH B.S. (Vice-Adml. Sir Doveton Sturdee):

*3rd Div.:*
"Iron Duke" (C.-in-C.; 10 13·5-in.),
"Royal Oak" (8 15-in.),
"Superb" (Rear-Adml. Alex. L. Duff; 10 12-in.),
"Canada" (10 14-in.).

*4th Div.:*
"Benbow" (flag; 10 13·5-in.),
"Bellerophon" (10 12-in.),
"Temeraire" (10 12-in.),
"Vanguard" (10 12-in.).

1ST B.S. (Vice-Adml. Sir Cecil Burney):

*5th Div.:*
"Colossus" (Rear-Adml. E. F. Gaunt),
"Collingwood,"
"Neptune,"
"St. Vincent"
(all 10 12-in.).

*6th Div.:*
"Marlborough" (flag; 10 13·5-in.),
"Revenge" (8 15-in.),
"Hercules" (10 12-in.),
"Agincourt" (14 12-in.).
With attached light cruisers "Boadicea," "Blanche," "Bellona," "Active."

1ST C.S. (Rear-Adml. Sir Robert Arbuthnot):
"Defence" (flag; 4 9·2-in., 10 7·5-in.),
"Warrior" (6 9·2-in., 4 7·5-in.),
"Duke of Edinburgh" (6 9·2-in., 10 6-in.),
"Black Prince" (6 9·2-in., 10 6-in.).

2ND C.S. (Rear-Adml. H. L. Heath; 10 7·5-in.):
"Minotaur" (flag; 4 9·2-in.),
"Hampshire" (4 7·5-in., 6 6-in.),
"Cochrane" (6 9·2-in., 4 7·5-in.),
"Shannon" (4 9·2-in., 10 7·5-in.).

3RD B.C.S. (Rear-Adml. Hon. Horace Hood):
"Invincible" (flag; 8 12-in.),
"Indomitable" (8 12-in.),
"Inflexible" (8 12-in.).

4TH L.C.S. (Commodore C. Le Mesurier):
"Calliope,"
"Constance,"
"Comus,"
"Caroline,"
"Royalist"
Attached light cruisers "Chester," "Canterbury."

### DESTROYERS WITH BRITISH MAIN BODY

11TH FLOTILLA: "Castor" (Commodore Jas. R. P. Hawkesley, Commodore),
"Kempenfelt," "Ossory," "Mystic," "Moon," "Morning Star," "Magic," "Mounsey," "Mandate," "Marne," "Minion," "Manners," "Michael," "Mons," "Martial," "Milbrook."

12TH FLOTILLA: "Faulknor" (Capt. Anselm Stirling, Comm.), "Marksman," "Obedient," "Maenad," "Opal," "Mary Rose," "Marvel," "Menace," "Nessus," "Narwhal," "Mindful," "Onslaught," "Munster," "Nonsuch," "Noble," "Mischief."

4TH FLOTILLA: "Tipperary" (Capt. Chas. J. Wintour, Comm.), "Brook," "Achates," "Porpoise," "Spitfire," "Unity," "Garland," "Ambuscade," "Ardent," "Fortune," "Sparrowhawk," "Contest," "Shark," "Acasta," "Ophelia," "Christopher," "Owl," "Hardy," "Midge."

### ADVANCED FORCE

Battle Cruiser Fleet, Flagship, "Lion"
Vice-Adml. Sir David Beatty; Chief of Staff, Capt. R. W. Bentinck (8 13·5-in.).

1ST B.C.S.:
"Princess Royal" (flag; Rear-Adml. Osmond de B. Brook),
"Queen Mary,"
"Tiger"
(all 8 13·5-in.).

2ND B.C.S.:
"New Zealand" (flag; Rear-Adml. Wm. C. Pakenham, 8 12-in.),
"Indefatigable" (8 12-in.).

5TH B.S.:
"Barham" (flag; Rear-Adml. Hugh Evan-Thomas),
"Valiant,"
"Warspite,"
"Malaya"
(all 8 15-in.).

1ST L.C.S.:
"Galatea" (flag; Commodore E. S. Alexander-Sinclair),
"Phaeton,"
"Inconstant,"
"Cordelia."

2ND L.C.S.:
"Southampton" (flag; Commodore W. E. Goodenough),
"Birmingham,"
"Nottingham,"
"Dublin."

3RD L.C.S.:
"Falmouth" (Commodore T. D. W. Napier),
"Yarmouth,"
"Birkenhead,"
"Gloucester."

### DESTROYERS WITH ADVANCED FORCE

1ST FLOTILLA: "Fearless" (Capt. C. D. Roper, Comm.), "Acheron," "Ariel," "Attack," "Hydra," "Badger," "Goshawk," "Defender," "Lizard," "Lapwing."

13TH FLOTILLA: "Champion" (Capt. J. U. Farie, Comm.), "Nestor," "Nomad," "Narborough," "Obdurate," "Petard," "Pelican," "Nerissa," "Onslow," "Moresby," "Nicator."

9TH AND 10TH FLOTILLAS (Harwich): "Lydiard" (Comdr. Malcolm Goldsmith),
"Liberty," "Landrail," "Laurel," "Moorsom," "Morris," "Turbulent," "Termagant."
Seaplane Carrier, "Engadine."

The German High Sea Fleet was organized as follows:—

### MAIN BODY

Fleet Flagship, "Friedrich der Grosse"
(C.-in-C., Vice-Adml. Reinhold Scheer; Chief of Staff, Capt. Adolf von Trotha).

3RD SQUADRON (Rear-Adml. Behncke):

*5th Div.:*
"König" (flag),
"Grosser Kurfürst,"
"Kronprinz,"
"Markgraf"
(all 10 12-in.).

*6th Div.:*
"Kaiser,"
"Kaiserin,"
"Prinzregent Luitpold"
(all 10 12-in.).

1ST SQUADRON (Vice-Adml. Ehrhard Schmidt):

*1st Div.:*
"Ostfriesland" (flag),
"Thüringen,"
"Helgoland,"
"Oldenburg"
(all 12 12-in.).

*2nd Div.:*
"Posen,"
"Rheinland,"
"Nassau,"
"Westfalen"
(all 12 11-in.).

2ND SQUADRON (Rear-Adml. Mauve):

*3rd Div.:*
" Deutschland " (flag),
" Hessen,"
" Pommern "
(all 4 11-in.).

*4th Div.:*
" Hannover,"
" Schlesien,"
" Schleswig-Holstein "
(all 4 11-in.).

4TH SCOUTING GROUP (Light Cruisers; Commodore von Reuter):
" Stettin," " München," " Frauenlob," " Stuttgart," " Hamburg."

DESTROYERS WITH MAIN BODY

" Rostock," light cruiser (Commodore Michelsen, First Commodore T. B. Forces).
1ST HALF FLOTILLA (Comdr. Albrecht): G39 and 5 boats.
3RD FLOTILLA (Capt. Böst): G101 and 10 boats.
5TH FLOTILLA (Capt. Heinecke): G11 and 10 boats.
7TH FLOTILLA (Capt. von Koch): S24 and 10 boats.

ADVANCED FORCE
(Vice-Adml. Hipper).

1ST SCOUTING GROUP
" Lützow " (8 12-in.),
" Derfflinger " (8 12-in.),
" Seydlitz " (8 12-in.),
" Moltke " (10 11-in.),
" Von der Tann " (8 11-in).

2ND SCOUTING GROUP (Light Cruisers):
" Frankfurt " (flag; Rear-Adml. Bodicker),
" Pillau,"
" Elbing,"
" Wiesbaden."

DESTROYERS WITH ADVANCED FORCE

" Regensburg," light cruiser (Commodore Heinrich, Second Commodore T. B. Forces).
2ND FLOTILLA (Capt. Schuur): B98 and 10 boats.
6TH FLOTILLA (Capt. Max Schultz): G41 and 10 boats.
9TH FLOTILLA (Capt. Göhle): V28 and 10 boats.

The British fleet was decidedly superior in almost every material element of fighting strength except armour protection, in which Beatty's battle cruisers were inferior to Hipper's.

The following table gives the aggregate strength of the opposing forces:—

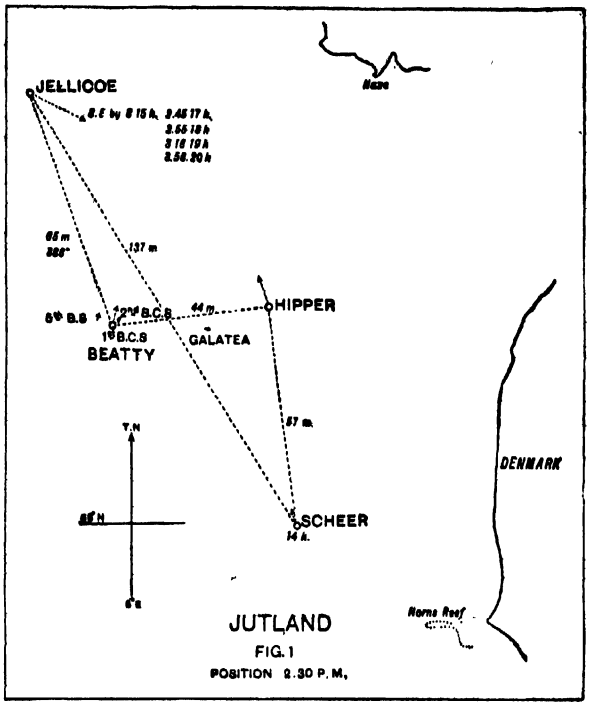
ADVANCED FORCES

| | British | German |
|---|---|---|
| Dreadnoughts | 4 | 0 |
| Battle cruisers | 6 | 5 |
| Light cruisers | 12 | 5 |
| Destroyers | 29 | 33 |
| Seaplane carrier | 1 | 0 |

MAIN BODY

| | British | German |
|---|---|---|
| Dreadnoughts | 24 | 16 |
| Pre-dreadnoughts | 0 | 6 |
| Battle cruisers | 3 | 0 |
| Armoured cruisers | 8 | 0 |
| Light cruisers | 10 | 6 |
| Destroyers | 53 | 39 |

The total fleet on both sides may further be classified thus:—



| | Dr. | Pre-dr. | B.C. | Cr. | L.C. | T.B.D. |
|---|---|---|---|---|---|---|
| British | 28 | 0 | 9 | 8 | 22 | 82 |
| German | 16 | 6 | 5 | 0 | 11 | 72 |

On a tonnage basis the British fleet had a superiority of about seven to four. Its superiority in heavy guns was equally marked. The British had a total of 344 heavy guns (48 15-in., 10 14-in., 142 13·5-in., 144 12-in.) with a weight of discharge of 396,700 lb. The Germans had a total of 244 heavy guns (144 12-in. and 100 11-in.) with a weight of discharge of 189,940 lb. The British fleet was also considerably superior in speed. Its slowest battleship had a sea-going speed of 20 knots, its fastest (the Barham class) could do 25. The German Königs, in spite of a current belief that they could do 23 knots, did little more than 21, and the six Deutschlands of the 2nd Squadron only 16.

Neither submarine nor aircraft played any actual part in the battle. In spite of numerous reports to the contrary, there was not a single submarine with either fleet nor in the immediate vicinity. A single seaplane was flown from the " Engadine " (with Beatty's force) but its report never reached the " Lion." The Germans had five Zeppelins on reconnaissance work to the N.W. of Heligoland, but they saw nothing of the battle.

At 2 P.M. the forces were in the position shown in fig. 1.

Beatty bore S.S.E. from Jellicoe. Criticism has been directed against the distance at which he was operating from the main

body. It may be said that, though the speed of the battle cruisers and the presence of the 5th Battle Squadron greatly diminished the danger of operating so far apart, there was no real advantage in it; and had the distance of the battle fleet been reduced to 30 m., the battle would have been joined an hour earlier. The wide separation of the two forces introduced a further complication. No arrangements had been made for maintaining visual touch, with the result that a discrepancy arose between the reckonings of the two forces, which led later to uncertainty as to the " Lion's " position and that of the enemy.

Both Jellicoe and Beatty were behind time in reaching their positions. Jellicoe's fleet was in six columns disposed abeam 1 m. apart on a S. 50° E. course zigzagging at 15 knots, with the first C.S. and second C.S. some 6 m. ahead spread 4 m. apart. Hood and the 3rd B.C.S. were some 20 m. ahead of him on the port bow. At 2:15 Beatty had reached his rendezvous and turned to N.E. to join the main body. The four battle cruisers of the 1st B.C.S. were in single line, led by the "Lion" and screened by the 13th Flotilla; the 5th B.S. was 5 m. off to the N.N.W. screened by the 1st Flotilla; the 2nd B.C.S. was 3 m. E.N.E. of the " Lion." The 12 light cruisers of the 1st, 2nd, 3rd L.C.S. were spread on a line bearing E.N.E. 8 m. apart, with the centre of the screen bearing S.S.E. 8 m. from the " Lion." Meanwhile Hipper's force of 5 battle cruisers, 5 light cruisers and 33 destroyers was on a northerly course some 50 m. ahead of Scheer and about 50 m. E. of Beatty. His light cruisers, with a number of attendant destroyers, were spread in a semicircle about 10 m. ahead. The German main fleet of 22 battleships, coming on behind him, was in line ahead, steering N. at 14 knots with the seven Königs in the van, the Heligolands led by the " Friedrich der Grosse " in the centre and the Deutschlands in the rear. The battleships were 763 yd. and squadrons 3,800 yd. apart.

The battle which followed may be divided conveniently into three principal phases:—

Phase I.: 2:15 to 5:40 P.M.— The battle-cruiser action between Beatty and Hipper. Hipper's junction with Scheer and the run to the north.

Phase II.: 5:40 to 9 P.M.—The junction with Jellicoe, the deployment of the British battle fleet at 6:15; Scheer's turn-away at 6:35. Scheer's return and second turn-away at 7:17 P.M. The British turn-away at 7:22 P.M. Beatty's engagement at 8:17 P.M.

Phase III.: 9 P.M. to 3:30 A.M.— The British fleet steers south. Scheer shapes course to the S.S.E. across its stern, breaks through the British destroyer flotillas and reaches Horn's Reef.

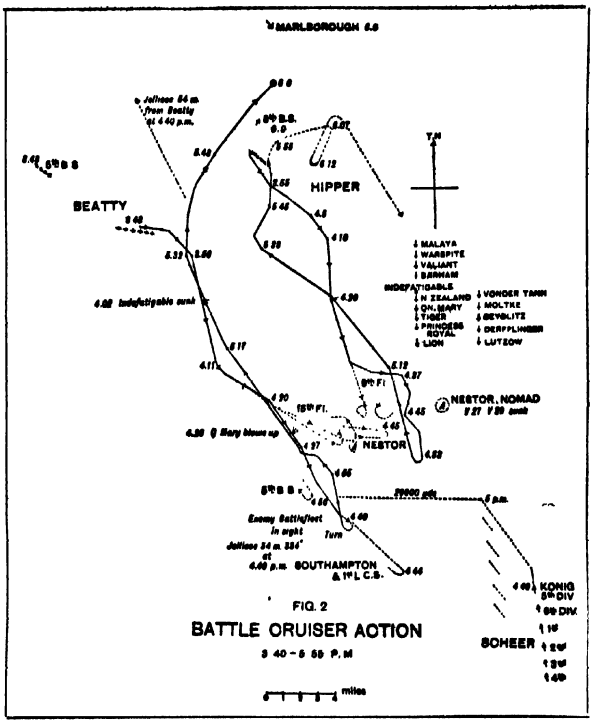
To return to the action impending between the battle cruisers. About 2:10 the "Elbing," on the left wing of Hipper's screen of light cruisers, sighted a neutral steamer and despatched a destroyer to examine it. The "Galatea" sighted the steamer and destroyer and proceeded to close them. The two forces were in touch and the light cruisers began to stream down to the point of contact, while Beatty altered course to S.S.E. at 2:32 P.M. to cut the enemy off from Horn's Reef. The 5th B.S. unfortunately did not immediately follow suit, but continued on its northerly course till 2:40 P.M., opening its distance from 5 to over 7 m. so that subsequently a considerable delay was caused in its coming into action. Hipper's light cruisers proceeded to chase the "Galatea" to the N.W., while the battle-cruiser forces, working up to full speed, came hurrying up to the support of their light cruisers.

At 3:24 P.M. the smoke of Hipper's battle cruisers could be seen, and at 3:30 they came in sight of the "Lion" bearing N.E. and steering N.N.W. Beatty now increased to 25 knots, and ordered the 2nd B.C.S. to take station astern. The enemy were still some 23,000 yd. off. Everything augured well for the coming battle. The visibility was good, the sun was behind the British squadron and the wind southeast. At 3:45 Beatty made a signal to the battle cruisers to form on a line of bearing N.W. to clear the smoke; but he had hardly done so when, at 3:48 P.M., the "Lützow" opened fire at 14,250 yd., and both squadrons turned to the S. to engage. Beatty's battle cruisers were now in single line ahead, Hipper's in starboard quarter line, and a fierce action ensued between the two squadrons, running to the S. on parallel courses at ranges varying from 14,500 to 20,000 yards. The action had hardly lasted a quarter of an hour when one of the "Lion's" turrets was hit by a shell which burst inside and put the turret out of action. Maj. Francis Hervey, R.M.A., the officer of the turret, though mortally wounded, ordered the magazine doors to be closed, a precaution which saved the ship from destruction and won him a V.C. in death. Almost at the same time a salvo from the "Von der Tann" struck the "Indefatigable" (Capt. C. F. Sowerby) by the after-turret at 4:12 P.M., and drove her out of line, sinking by the stern. As the fleet went on, another salvo struck her forward and she turned over and disappeared.

The 5th B.S., which was some 7 m. behind Beatty when the action began, did not get within range till about 4:11 P.M.; it then opened fire at 19,000 yd. on the rear ship, the "Von der Tann." By 4:16 the "Moltke" was also under its fire, but the light was becoming difficult and the enemy could not be clearly seen. Another disaster now befell the British battle cruisers. At 4:26 P.M. a salvo from the "Derfflinger" struck the "Queen Mary," causing an explosion in the forepart of the ship, and she sank by the bows with the stern high in the air. Then followed a terrific explosion, which rent the whole ship, and she disappeared in a dense pall of smoke. The "Tiger" and "New Zealand" passed through the dreadful cloud with a rain of debris falling on their decks. But the fire of the British battle cruisers, joined to that of the 5th B.S., was now telling heavily on the enemy; and at 4:30 P.M. Hipper turned abruptly four points to port and proceeded E., with the "Lützow" on fire.

The loss of these two British battle cruisers must be attributed to insufficient armour protection and defective turret construction, which allowed flash and flame to pass into the magazines. The Germans had profited by the lesson learnt at the Dogger Bank, when the turrets of the "Seydlitz" were burnt out, and their turrets had been equipped with suitable safeguards.

As early as 4:15 P.M. the 13th Flotilla, on the "Lion's" starboard side, had been ordered to attack and, crossing the "Lion's" bows about 4:30 P.M., rushed to the S.E. to do so. The German destroyers came out to meet them, and a sharp destroyer action developed between the two lines. Two German boats were lost—V27 sunk by gunfire and V29 by a torpedo from the "Petard." The "Nestor" (Comdr. Hon. E. A. Bingham), "Nomad" and "Nicator" pressed boldly on to the E. and pushed home their attack, but were badly hit, and the first two were left helpless between the lines, to be sunk by a tornado of fire from the German battle fleet as it came up. Their crews were saved by German destroyers, and Comdr. Bingham was awarded a V.C. No torpedoes got home on either side.



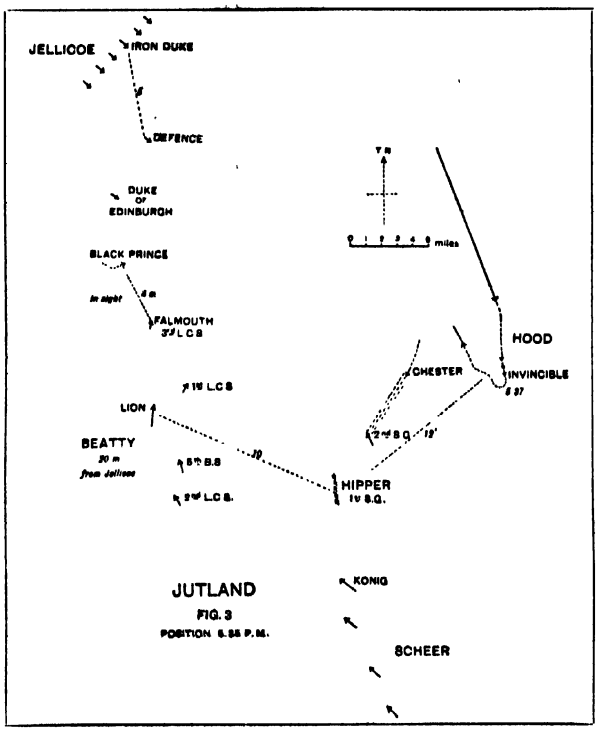


FIG. 2
BATTLE CRUISER ACTION
3 40 - 5 55 P.M

It was now 4:33 P.M. The battle cruisers had run some 20 m. to the S. since the action commenced, when the "Southampton," 4 m. ahead of the "Lion," suddenly sighted the enemy's battle fleet to the S.E. for the first time during the war. The great opportunity so eagerly awaited in the British fleet seemed to have come at last. The German fleet was some 14 m. off, and at 4:40 P.M. Beatty, still well beyond its range, turned to the N. to draw it back on Jellicoe and the battle fleet. The 5th B.S. was coming down from the N. and at 4:48 P.M. he signalled to them to turn. Unfortunately the rear-admiral delayed his turn till 4:56 and ran past the battle cruisers, perhaps with the intention of covering them, but with the result that the squadron came under a heavy fire from the leading division of Scheer's battle fleet, and the "Barham," "Warspite" and "Malaya" were severely hit. Scheer, on receiving information of the British battle cruisers at 3:35, had closed his line to battle formation (ships 545 yd. and squadrons 1,090 yd. apart). At 4:5 P.M. he altered course N.W. and increased to 15 knots, and at 4:20 altered course to W., intending to catch Beatty between two fires. But hearing that five battleships had joined in the fight he thought better of it and turned to north. At 4:30 the British forces were in sight. The weather was clear, with a light breeze from north-west. At 4:45 fire was opened by the Königs in the van on the 5th B.S. Hipper, as he saw the battle fleet coming up, turned to starboard at 4:48 and took station 7 m. ahead of it.

Now commenced a long rush to the N., with Scheer some 10 m. on Beatty's starboard quarter and Hipper 9 m. or so to the eastward. At 4:45 P.M. Jellicoe was some 66 m. to the N.W., and Hood with the 3rd B.C.S. some 30 m. to the N.N.E., so that Scheer was approaching the mouth of a trap, with Jellicoe to the N.W., Hood to the N.E., and Beatty to the W. shepherding him in. Beatty's squadron had suffered severely, but if he could once bring Scheer within reach of the thunderbolt coming down on him from the N.W. his losses should be amply avenged.

Jellicoe meanwhile, going S.E. by S. at 19 knots, had received news of the enemy battle cruisers at 3:40 P.M., and had increased to 20 knots at 3:59. Hood had been ordered to proceed to Beatty's support at 4:5 and had shaped course S.S.E. at 25

knots, a course which turned out very happily in the end, and gave the enemy an entirely wrong idea of the tactical situation. The discrepancies in reckoning, in conjunction with mistakes arising from the clumsy form of latitude and longitude code in use at the time, made it difficult for the C.-in-C. to get a clear idea of the exact situation, but by 4:45 P.M. it was clear to him that the enemy's battle fleet was coming N. and he informed the Admiralty that a fleet action was imminent. The word ran down to the dockyards and started a bustle of preparation to meet the needs of the fleet. It is impossible to give in detail the events of the next crowded hour. It was of great importance for the C.-in-C. to get the correct bearing of the enemy battle fleet, but the wireless reports were confusing for the reasons mentioned above. The "Iron Duke" was actually some 4 or 5 m. to the S.E. of her reckoning and the "Lion" some 5 m. to W. of hers, which threw out their bearings and the estimated positions of the enemy.

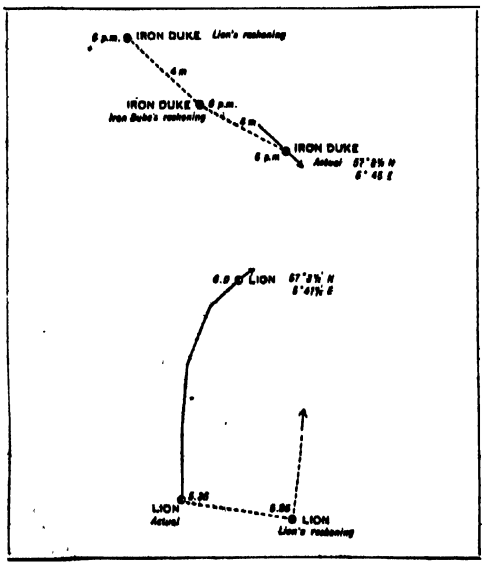

Fig. 4.—Discrepancies in Reckonings ("Iron Duke" and "Lion").

The 5th B.S., following some 3 m. astern of the "Lion," remained for some time within range of the enemy battle fleet, and its rear ship, the "Malaya," was being hit right up to 5:35 P.M. This gave rise to an erroneous idea that the enemy had a speed much in excess of 21 knots, but it was due to the 5th B.S. running on a convergent course and not to the enemy's speed, which never exceeded 21 knots.

Between 5:40 and 6 P.M. two actions developed. The action between Beatty and Hipper burst out afresh (5:40); the "Chester" (on the starboard beam of Hood's squadron), coming down from the N.E., struck the 2nd Scouting Group ahead of Hipper, got badly mauled and retired—leaving the British with the heroic picture of Boy Jack Cornwell winning the V.C. Hipper, whose fire was hampered by the setting sun, was heavily hit by Beatty and was forced to turn to the eastward (5:53). By this time Hood in the "Invincible" had arrived on the scene some 20 m. to the E. of Beatty; hearing the roar of the guns, he turned to the N. with the 3rd B.C.S. (5:57) and engaged the light cruisers of the 2nd S.G. to the W., which were chasing the "Chester" east. The sudden appearance of battle cruisers to the E. gave Boedicker's cruisers a severe shock. Hood's 12-in. shell forced them sharply to the S.E. (5:55), seriously damaging the "Pillau" and sending the "Wiesbaden" limping W. to her destruction. The "Shark's" little flotilla behind the 3rd B.C.S. saw the German light cruisers and pushed boldly out to the N.W. to attack them. Hipper, now coming E. behind Boedicker, heard the "Invincible's" guns ahead, thought they were those of the British battle fleet, took the "Shark" to be the head of a big destroyer attack, and turned right round to S.W. to close his own battle fleet (6:7). The German 9th Flotilla rushed out to screen their light cruisers, drove off the "Shark's" little flotilla and sank the "Shark"; the V48 was sunk at this time, and, close to where Jack Cornwell won his V.C., Comm. Loftus Jones, with his leg shot off and his ship sinking, won another. Hipper, after proceeding to the S.W. for five minutes, turned round again at 6:12 P.M., and as he came up on a N.E. course, the little "Acasta" (Lt.-Comdr. J. O. Barron), which had been trying bravely to help the "Shark," sent a torpedo into the "Seydlitz."

All this happened some 10 m. ahead of the British battle fleet, which was now close at hand to the north-west. Its deployment had been deferred too long, and it was still in divisions disposed abeam, with the "Marlborough" on the starboard wing. Mist had come down, reducing the visibility to 5 or 6 m., and it was difficult to get a correct idea of the situation, for the thunder of heavy guns could be heard from right ahead (Hood) almost to the starboard beam (Beatty). The "Lion" had been steering approximately N. by E. since 5:35 P.M., with the 5th Battle Squadron about 3 m. on her starboard quarter. The "Falmouth," ahead of the "Lion," was in touch with the "Black Prince" as early as 5:30 P.M., but it was not till about 5:55 P.M. that Beatty's force could be clearly seen. By 6 P.M. the battle fleet was clearly in sight, and, finding himself converging on the "Marlborough," which was then some 3 m. N. by E., Beatty turned to the E. to take station ahead of her. Scheer had deployed at 5:42 P.M. and was now on a N.E. course led by the "König," which at 6:14 P.M. was about 7½ m. 27° on the "Marlborough's" starboard bow. At this moment two reports of the enemy battle fleet came in from the "Barham" and "Lion," the former placing it S.S.E., the latter S.S.W. The "Lion" was then a mile or two sharp on the "Iron Duke's" starboard bow, going hard to the E. and engaging the enemy. The "Barham" was some 3 m. off, before the "Iron Duke's" beam, drawing ahead of the "Marlborough" on a S.E. course. In conditions of low visibility, the C.-in-C. had prescribed a deployment on the wing next the enemy, and this is evidently what Beatty expected. But there seemed to be a risk of deployment into single line on the right wing, involving the "Marlborough" and her division in a premature action, and the C.-in-C. decided to deploy on the left wing. The signal, equal speed—pennant, C.L.—went up at 6:15 P.M.

With columns covering a front of 5 m., to deploy on the wing farthest from the enemy meant an increase of the range from about 8,500 to 13,000 yd., a serious matter when visibility was

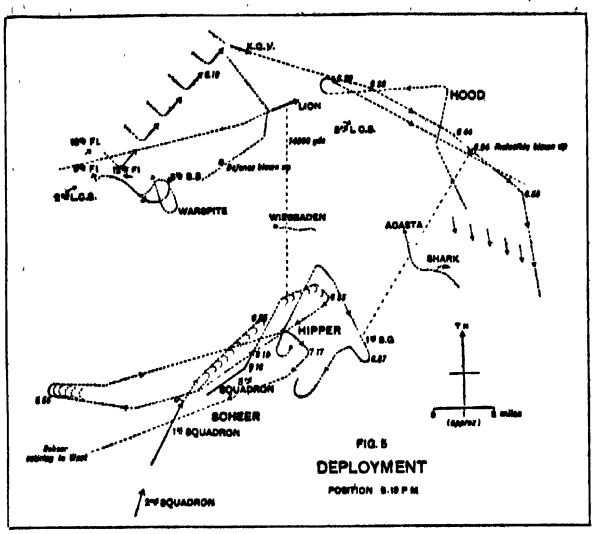

FIG. 5
DEPLOYMENT
POSITION 5.10 P.M.

not much more than 11,000 yards. But in the mist and uncertainty one thing could be clearly seen.

The "Lion" with Beatty's flag could be seen some 2 m. ahead of the "Benbow," steering E.S.E. and engaging the enemy. To bring the enemy within effective range, the C.-in-C. had only to follow in that direction, ordering the battle fleet to deploy on one of the centre columns led by the "Benbow" or "Iron Duke." Whether this course occurred to the C.-in-C. it is impossible to say (no mention of it appears in his own book). In any case, the deployment signal did not permit of deployment on a centre column or on any but a wing column. The deployment therefore began on the left wing. The "King George V." led out on a S.E. by E. course; the five leaders of divisions turned to N.E., their ships formed a long single line behind them and filed round behind the "King George V." The "Defence" ahead of the battle fleet had already engaged the 2nd S.G. about 5:50 P.M. and now saw the "Wiesbaden" returning. She pressed impatiently with the "Warrior" across the bows of the "Lion" to engage her, only to receive two crushing salvos from the "Lützow" or "Friedrich der Grosse," and to blow up at 6:19 P.M. in a vast pall of smoke. The deployment on the left wing placed Rear-Adml. Evan-Thomas in a difficult position. The battle orders instructed him to take station in the van in the event of the enemy deploying away from Heligoland, but this meant fouling the range of the battle fleet, and he decided to turn up astern of the "Marlborough" and made a wide sweep to port to do so; here the "Warspite's" helm jammed (6:17), and she made a complete circle to starboard, passing right round the "Warrior," saving her from the fate of the "Defence." The deployment was completed by 6:40 P.M. When it started Scheer was coming up on a N.E. course. By 6:27 P.M. when the fleets engaged, his 1st and 3rd Squadrons were on an E.N.E. course, just visible in twos and threes at about 14,000 yards.

Both fleets were now steering to the E. on approximately parallel courses. The "Iron Duke" opened fire at 6:30 P.M., and between 6:25 P.M. and 6:40 P.M. the British, who had evidently much the better horizon, were able to inflict considerable punishment on the head of the German line, whose ships could see nothing but the flashes of the British guns. Meanwhile the "Invincible" had turned E. ahead of Beatty's squadron and come into action (6:23 P.M.) with Hipper as he came up again on a N.E. course. A fierce engagement ensued between them, running to the S.E. at about 12,000 yds. The mist cleared for a few minutes, and at 6:34 the "Derfflinger" sent a salvo into the "Invincible's" midship turret. A tremendous explosion followed, the masts collapsed, and the great ship disappeared beneath the waves, leaving her bow and stem standing as if to mark the place where an admiral lay. The "König" at the head of the German line had turned to S.E. at 6:38 P.M. Scheer was now fully alive to the fact that he was facing the entire British fleet. The whole northern horizon was aflame. He gave the order for a "battle turn" (*Gefechtswendung*). The whole line turned at 6:35 and drew off to westward. In the mist and smoke it was lost to view and Scheer obtained a much-needed respite.

As the line turned, the German 3rd Flotilla darted out to attack the British line. It was recalled, but three boats (G88, V73, and S32) went on and, unopposed by any British flotillas, who were apparently too busy taking up their deployment positions to notice them, made two attacks on the British line, one of which was probably responsible for torpedoing the "Marlborough" at 6:54 P.M. At 6.55 P.M. the long British line turned to S., leaders together, bringing the fleet into divisions again with guides bearing south-east. The movement fulfilled no tactical purpose. It had taken half an hour to deploy the fleet, and no sooner was it deployed than it turned back into divisions in a formation unsuitable either for attack or defence. The "Marlborough's" division was left on the right wing, exposed to attack, uncovered by any of the destroyer flotillas, which remained clinging to the positions given them for deployment in single line.

Beatty grasped the significance of the new formation, and, turning to allow the 3rd B.C.S. to take station behind him, shaped course to the S.W. right across the track of the advancing battle fleet and towards its exposed wing. Scheer was meanwhile making to the W. in a ragged sort of single line, with the battle cruisers in rear. The "Lützow" was down by the bows and on fire, and Hipper left her to transfer his flag to the "Seydlitz," but, finding her full of water with her wireless out of action, went on to the "Moltke." But the battle cruisers had now turned to renew the action; the "Moltke" was under fire and could not stop, and it was 9 P.M. before Hipper could get on board.

When Jellicoe turned to S. at 6:55 P.M. the German fleet was some 13 m. S.W. of him, making to the westward. Scheer's next movement was one which exposed him to a tremendous counter-blow. He still had his whole fleet with him, and as it was too early to get into formation for the night he decided to turn and make a determined advance in the teeth of the foe. The motives actuating him are described by himself as follows. If the British were following him his move to the W. was nothing more than a retreat, which would involve the sacrifice of damaged ships and meant his tactics being dictated by the enemy. It was still less feasible to try and detach himself from the enemy, leaving the British C.-in-C. to choose where to engage him in the morning. The only way of preventing this seemed to be to force the British into a second battle by another determined advance. This would be bound to surprise the enemy and upset his plans for the rest of the day, and, if the blow fell heavily, would help the German fleet to liberate itself during the night. These arguments are grandiloquent but inconclusive, and it is more probable that Scheer intended to slip past the stern of the British fleet unobserved, but he had mistaken its position and ran right into it. In any case, the fact that Scheer did liberate himself must not obscure the fact that his movement was full of risk, and, had the British fleet been pursuing him, must have ended in disaster. As it was, it met with a considerable measure of success. The whole German line swung round together to the E. again (6:55 P.M.), with the battle cruisers ahead led by Capt. Hartog in the "Derfflinger." The German destroyers attached to the battle cruisers attacked the "Marlborough's" division about 7 P.M., but were driven off by gunfire after firing six or seven torpedoes without effect.

At 7:12 P.M. the British fleet coming S. saw the enemy battle cruisers returning through the mist. The Germans sighted them simultaneously and turned parallel to the British course at a range of under 10,000 yards. The "Hercules" opened on the "Seydlitz," and the guns of most of the fleet, with Beatty's battle cruisers ahead of it, joined in. The "Derfflinger" and "Seydlitz," now came under [illegible] fire. In the [illegible] two 13·5 in. shells (probably from the "Revenge") crashed into the after turrets, igniting the charges and sending great pillars of flame

roaring skywards in which the crews of both turrets perished. The "Derfflinger" succeeded in getting two hits into the "Colossus," the only hits scored by the Germans on the battle fleet. Scheer, some 3 m. behind his battle cruisers, saw it was time to turn. The line swung round together to the W. again at 7:17 P.M., and the 6th and 9th Flotillas threw up a smoke cloud and rushed out to attack.

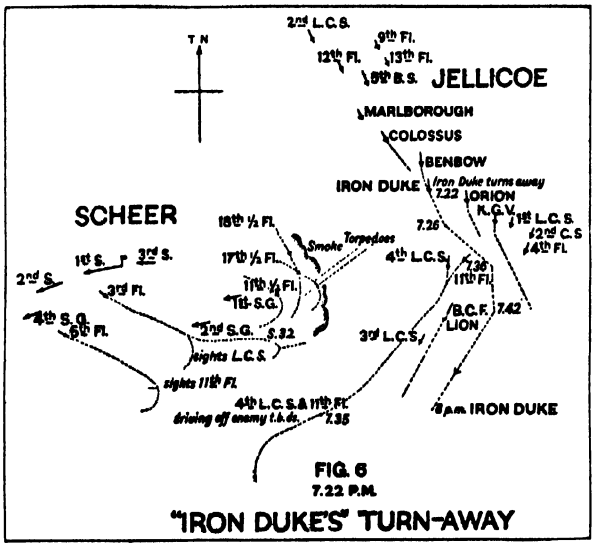

FIG. 6
7.22 P.M.
"IRON DUKE'S" TURN-AWAY

As they approached, the British battle fleet turned away two points to port by signal at 7:22 P.M. and another two points at 7:26, making the "Iron Duke's" course south-east. This was the "turn-away" which has given rise to considerable controversy. Eleven torpedoes reached the lines of the 1st B.S. at 7:35 P.M. and were avoided by the use of helm. The British fleet was now going no more than 15 knots. The 5th B.S. (except the "Warspite," which had fallen out) was plodding along in rear at the same speed, wasting all the foresight, money and ingenuity expended in giving it a speed of 25 knots to pursue and encircle an enemy. But now the real counter to torpedo attack was found. The 4th L.C.S. and 11th Flotilla were ordered to attack and were making W. towards the exposed wing of the battle fleet. The German 5th and 3rd Flotillas, which were advancing to attack, fled before them, and only one of their torpedoes reached the "Marlborough's" line. At 7:35 P.M. Adml. Jellicoe turned back from S.E. to S. by W. and re-formed single line on a S.W. course by 8 o'clock.

The actual transfer to the E. of the original course in the case of the "Marlborough," caused by the turn-away, was little more than 1,250 yards. This in itself was no great distance, but the retention of the battle fleet on a south-easterly course, while the enemy was making W., opened a gap of several miles between the two fleets and made it difficult to renew the engagement before nightfall. The only movement of any real use at 6:55 P.M. and 7:22 P.M. was to follow the enemy and cut him off, as the battle cruisers attempted to do. From 6:55 P.M. the British fleet was meandering along to the S., when tactics of encirclement and pursuit were required to deal a decisive blow. Unfortunately Adml. Jellicoe considered the risk of submarine and torpedo too great for such tactics, though there were no submarines anywhere near the scene of action; and, after 7:36 P.M., as soon as the 4th L.C.S. and 11th Flotillas gripped the situation, they never allowed the German flotillas to approach.

Beatty's battle cruisers had meanwhile been making to the S.W. and were 5 or 6 m. ahead of the battle fleet. At 7:47 P.M. the enemy was still in sight from the "Lion," and Beatty, evidently fearing that night might fall without a decisive blow, sent a signal to the C.-in-C. asking that the van of the battle fleet might follow him in an attempt to cut them off. At 8 P.M. the battle fleet turned W. in divisions with guides bearing north-east. Scheer was some 18 m. W.N.W. of it on a S. course, so that the fleets were again converging. At 8:10 P.M. the C.-in-C., in reply to Beatty's signal, ordered the 2nd Battle Squadron (Vice-Adml. Sir Thomas Jerram in the "King George V.") to follow the battle cruisers. But, apparently because Beatty was not actually in sight,—though the "Minotaur" (2nd C.S.) was in sight of both the "Lion" and "King George V." and could have given him the "Lion's" position as she gave the "Lion" that of the "King George V.,"—he remained with the battle fleet and made no attempt to follow Beatty.

At 8:15 P.M. the fleets again came into contact. The "Castor" and 11th Flotilla ahead of the British battle fleet sighted the German destroyers on Scheer's port bow, and, supported by the 4th L.C.S., drove them helter-skelter away. The "Calliope," "Comus" and "Constance" chased them right back to their battle fleet; and the "Calliope," making a torpedo attack on the "Westfalen," came under a heavy fire, and was hit five times, though not disabled. About 8:15, too, the "Falmouth" (3rd L.C.S.) and Beatty's battle cruisers, about 6 m. to S.W. of the battle fleet, sighted Hipper's squadron and the 2nd Squadron of Deutschlands on a S. course. A short sharp action developed at about 10,000 yd. Hipper's ships were hit again, as well as the "Schlesien," "Schleswig-Holstein" and "Pommern." At 8:30 P.M. they turned away to the S.W., passing behind the 3rd and 1st Squadrons. The British battle fleet heard the guns, and at 8:30 P.M. turned into single line again on a S.W. course.

At 9 P.M. there could be no doubt that the enemy was some 6 or 7 m. to the N.W., but dusk was falling (sunset 8:7 P.M.), and the C.-in-C., having decided not to run the risk of a night action, turned S. in divisions. Half an hour later (9:27) the destroyers were ordered to take station astern 5 m. and took station in the following order from W. to E.: the 11th (next the enemy), 4th, 13th, 9th and 12th Flotillas. Unfortunately they were given no information as to the position of the enemy or of their own squadrons and flotillas or of the C.-in-C.'s intended movements, with the result that, instead of making organized attacks on the enemy fleet, the 4th Flotilla blundered into it during the night and was broken up or driven away.

Scheer at 9 P.M. had ordered his fleet to proceed in on a course S.S.E. ½ E. at 16 knots. The 2nd Scouting Group was on the port bow, the 4th Scouting Group just ahead. Then came the battle fleet in line ahead, the 1st Squadron in front (ships in re-

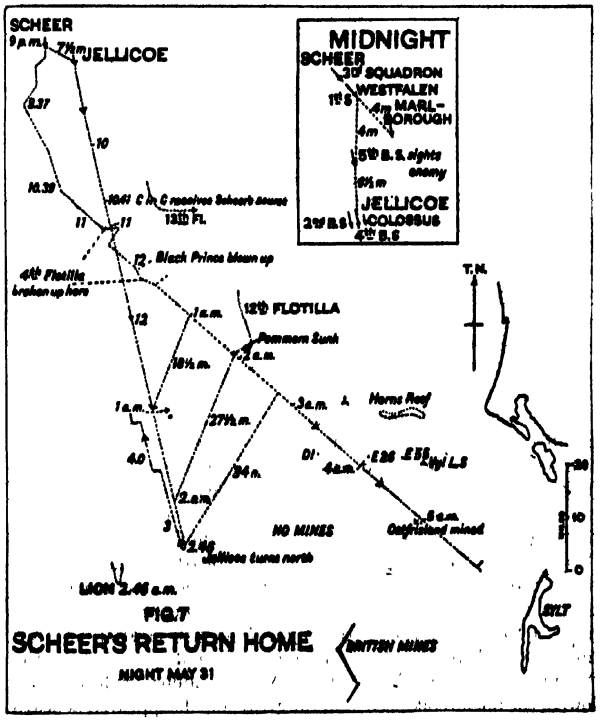

FIG. 7
SCHEER'S RETURN HOME

versed order) with the "Westfalen" leading, and the 3rd and 2nd Squadrons behind. The "Derfflinger" and "Von der Tann" formed the rear guard. The "Lützow" and "Seydlitz" had fallen out. The movements of the night can only be briefly described. The British fleet continued to steer south. The German fleet passed diagonally across its rear on a S.S.E. course, crashing through the British destroyer flotillas on its way.

About 10:30 P.M. the 4th Scouting Group struck the 2nd L.C.S., then some 7 m. astern of the battle fleet. A short but fierce action ensued. The "Southampton" and "Dublin" were severely damaged, but the former, though she suffered severely, torpedoed the "Frauenlob," which had to be abandoned later. At 10:41 P.M. Adml. Jellicoe received Scheer's course from the Admiralty, which showed clearly that the latter was retiring towards Horn's Reef. To ensure meeting him next morning it was necessary to turn to a parallel course; Adml. Jellicoe did not do so, nor did he inform Beatty or anyone else of the enemy's course, and the fleet continued to steer south. At 11:30 P.M. there commenced a series of actions behind the battle fleet, which, passing from W. to E. across its stern, pointed a great finger almost directly at Horn's Reef, leaving a trail of burning vessels to mark the course of the German fleet as surely as the compass in Scheer's flagship. They can only be briefly described. At 11:30 P.M. the 4th Flotilla was struck and the "Tipperary" left blazing. The gallant little "Spitfire," trying to help her, rammed the "Nassau," smashed the battleship's searchlights, had her own bridge and funnel blown away by an 11-in. shell, but got safely away with some 30 ft. of German plating on her bows. The "Rostock" was torpedoed in this encounter; the "Elbing" was rammed by the "Posen" and had to be abandoned, and sank. The 4th Flotilla turned away to the E., but, turning S. and ignorant of the German fleet's course, ran into it again at midnight, when the "Fortune" and "Ardent" were sunk. The "Black Prince," which had evidently been following the British fleet, was unlucky enough to run into the German fleet at this time, and, coming under a tornado of fire from the "Ostfriesland" and "Thüringen" at 1,600 yd., vanished in a terrific explosion. The "Marlborough's" division and the 5th B.S. had fallen behind the fleet and crossed only some 3 or 4 m. ahead of the enemy battle fleet, whose ships were seen (the "Westfalen" being even recognized), a situation which might have developed in a variety of ways.

At 0:25 A.M. the 9th Flotilla was struck and the "Turbulent" sunk. The 13th Flotilla had made off to the eastward. At about 1:45 A.M. the 12th Flotilla sighted the enemy, but Capt. Anselm Stirling drew off and made an organized attack at about 2:10 A.M., sinking the old battleship "Pommern." The 13th Flotilla sighted the enemy again at 3:30 A.M. and turned away, but the "Moresby" attacked and torpedoed the V4.

It was now getting light. Not a moment was to be lost if the German fleet was to be cut off, but at 2:40 A.M. the C.-in-C., instead of steering E. by N. for Vyl Shoal or Horn's Reef, altered course to north. At 3:29 A.M. another important signal arrived from the Admiralty, giving the German position not far from Horn's Reef at 2:30 A.M. It was still possible to try to intercept their disabled ships. There were no German mine-fields, nor any information of any, N. of Heligoland, and the only mine-fields near Amrum were a couple of British ones laid in 1915, which were certainly extensive but whose position was known. The C.-in-C., however, did not proceed farther, but at 3:42 A.M. turned W. and reduced to 15 knots. It is impossible to see in the fleet's movements any intention of renewing the action. The reason given is that the fleet was too scattered, but it would not have been scattered if it had been told to be 15 m. from Horn's Reef at 2:30 A.M. The destroyers would not have been scattered if they had not been left right in the path of an advancing enemy with no information as to his movements. Beatty would not have been 15 m. away to the S.W. of the battle fleet if he had known the German fleet was making for Horn's Reef. But he was not told. No one was told.

The action ends here. The German fleet proceeded in. The "Ostfriesland" struck a mine laid by the "Abdiel" on May 5. The "Seydlitz" did not pass the Reef till 4 A.M. Three British submarines were off Vyl Light, but they had been told nothing and saw nothing.

The battle was not a decisive one, and the British battle fleet was never seriously under fire (its casualties were two men killed and five wounded). It must be admitted that the British C.-in-C.'s tactics were characterized by excessive caution. They were limited to the conception of a battle in single line at long ranges on a parallel course, and when Scheer turned away the British system of tactics did not permit of pursuit and fell to pieces. The C.-in-C.'s conception of tactics is to be found in a letter to the Admiralty of Oct. 30 1914 (Jutland Despatches, 601), which merits careful study, for (while it shows that he acted on a prearranged plan) it really constitutes a negation of the battleship and of battle-fleet tactics. Movements in battle were to be governed on this theory, not by the necessity of getting within effective range, but by the necessity of avoiding supposititious submarines. The principles formulated in that letter had, however, been endorsed by the Admiralty, and they were followed at Jutland, though a defence of these principles or of the tactics of the British fleet at Jutland must lead with stern and irrefutable logic to the proposition that the battleship is an instrument of the past. The British tactics were dominated by a fear of the submarine or torpedo. There were no submarines present in the vicinity, and after 7:36 P.M. one light cruiser squadron and a single flotilla of destroyers proved sufficient to drive off the enemy's destroyers. It has been argued that this caution was justified because Britain's naval strength was practically all concentrated in the Grand Fleet. The answer, from a naval point of view, is that it was concentrated in the Grand Fleet for the very purpose of dealing a decisive blow; and commerce defence, convoy and anti-submarine work had all been sacrificed to enable it to do so. The immediate result of the failure of Jellicoe to strike a decisive blow was that the German High Fleet remained intact, to be a bulwark to its submarines, and, by barring the Baltic, to hasten the disintegration of Russia.

Measured in terms of size and serried steel, and of opportunity, the battle of Jutland must bulk large in naval history, but the actual results at the moment were small. If a battle is merely an incident or a move in a blockade it may possibly be regarded as won when the enemy retires to harbour. No further fleet action occurred during the war, and eventually the German fleet surrendered. From one point of view, therefore, it may be said that the result was successful. But if a battle represents in war the economy of the decisive blow; if the enemy's fleet can still play an important part in the campaign; if, as Foch said, there can be no victory without a battle; and if Nelson's teachings are sound—then the battle of Jutland, taken by itself, must rank merely as a great and unique opportunity for the British fleet, of which advantage was not sufficiently taken.

*Losses.*—The British losses were 3 battle cruisers, 3 cruisers and 8 destroyers—namely, battle cruisers: "Indefatigable" (gunfire, 4:6 P.M.), "Queen Mary" (gunfire, 4:26 P.M.), "Invincible" (gunfire, 6:34 P.M.); cruisers: "Defence" (gunfire, 6:19 P.M.), "Warrior" (gunfire and abandoned, 7:45 A.M.), "Black Prince" (gunfire, 0:25 A.M.); destroyers: "Nestor" and "Nomad" (5:15 P.M.), "Shark" (6:5 P.M.), "Tipperary" (11:30 P.M.), "Ardent" and "Fortune" (midnight), "Turbulent" (0:30 A.M.), "Sparrowhawk" (collision and abandoned, 9:10 A.M.).

The German losses were one battleship, one battle cruiser, four light cruisers and five destroyers—namely, battleship: "Pommern" (torpedoed, 12th Flotilla, 2:10 A.M.); battle cruiser "Lützow" (gunfire, abandoned and sunk, 1:45 A.M.); light cruisers: "Wiesbaden" (gunfire, 7 P.M.), "Frauenlob" (torpedoed, "Southampton," 10:20 P.M.), "Elbing" (collision, 11:30 P.M.), "Rostock" (torpedoed, 4th Flotilla, 11:30 P.M.); destroyers V27 (13th Flotilla, 4:40 P.M.), V29 (torpedoed by "Petard," 4:40 P.M.), V48 (about 6:30 P.M.), S35 (gunfire, at 7:25 P.M.), V4 (torpedoed by "Moresby," 2:45 A.M.).

*Casualties.*—On the two sides these may be tabulated as follows:—

| | Officers | | | Men | | | |
|---|---|---|---|---|---|---|---|
| | Killed | Wounded | Prisoners | Killed | Wounded | Prisoners | Total |
| British | 328 | 28 | 10 | 5,769 | 485 | 167 | 6,787 |
| German | 160 | 40 | | 2,385 | 454 | | 3,039 |

(A. C. D.)

**JUVENILE EMPLOYMENT.** I. GREAT BRITAIN—At the census of April 1911, 2,272,766 persons under 18 (1,336,907 boys and 935,859 girls) were returned as employed in Britain. Of this number 147,023 (98,157 boys and 48,866 girls) were under 14 years of age. These figures, in so far as they related to children under 14 years of age, were made up of children who had obtained partial or total exemption from school attendance. The Employment of Women, Young Persons and Children Act, 1920, now forbids the employment of children under 14 in any industrial undertaking, unless they were legally so employed on Jan. 1 1921.

Pending the coming into operation of certain sections of the Education Act, 1918, which were suspended for temporary reasons, total or partial exemption from school attendance might in 1921 be granted by the local education authority to enable children over 12 years of age to undertake work of a non-industrial character.[1] In England children over 11 years of age and in Scotland children over 8 years of age (in this latter case for six weeks of the year only) may obtain partial exemption for the purpose of employment in agriculture. Exemption from school attendance is granted subject to the attainment of a minimum standard of education or of school attendance, and on condition that the prospective employment of the child is, in the view of the local education authority, "beneficial." The practice as to the grant of exemptions varies widely in different areas and in accordance with different local by-laws. In addition to employed children who are relieved in part or altogether from school attendance, a considerable number who are in full-time school attendance are employed out of school hours. The total number of such children in 1913 was roughly estimated to be 245,000.

From the beginning of the 20th century there was a marked increase of public interest in Great Britain in the social results of the industrial employment of juvenile workers. This interest was shown in movements to preserve and restore the practice of formal apprenticeship, and in an agitation, for which Mr. R. H. Tawney was largely responsible, to discourage, or at all events to control, the entry of boys into "blind-alley" employment upon leaving the elementary schools. Attention was drawn to the fact that very large numbers of boys were employed in industries which offered them no career as adults. Boys were attracted to such industries by relatively high wages, were retained for two or three years, *e.g.* as van-boys or as workers upon routine processes of little or no educational value, and were thrown upon the labour market at the age of 16 or 17 to find fresh employment. These difficulties were brought very fully to the notice of the Royal Commission on the Poor-Law (appointed Dec. 1905; reported Feb. 1909). Both the majority and minority reports of the Royal Commission made recommendations in the matter. There was agreement that boys should remain at school until 15 years of age. The minority recommended part-time compulsory attendance at "continuation" classes up to the age of 18. The majority recommended exemption below 15 years of age only to boys leaving to learn a skilled trade, and the grant of power to recall to school boys under 16 years of age "not properly employed." The majority further recommended the establishment in connexion with labour exchanges of a special organization for giving boys, parents, teachers and school managers information and guidance as to suitable occupations for children leaving school. Nine years were to elapse before legislation was obtained to enable the school-leaving age to be raised, but prompt action was taken upon the other recommendations of the majority.

The Labour Exchanges Act, passed in Aug. 1909, provided the labour exchanges which were to be the centre round which the organization for the direction of juvenile labour was to be formed, and gave power to establish the advisory committees which such an organization required.

In 1910 the Choice of Employment Act enabled local education authorities, with the approval of the Board of Education, to form committees designed to assist children upon their entry into employment. By arrangement between the Board of Trade and the Board of Education "juvenile employment committees" have been formed in practically all industrial areas of importance by the Board of Trade (from Feb. 1918 the Ministry of Labour) under the Labour Exchanges Act, or by the local education authorities under the Choice of Employment Act. Fifty-two such committees had been formed in July 1914, and at the beginning of 1921 some 250 were in operation (150 working directly under the Ministry of Labour and 100 responsible to the local education authorities). The committees consist of representatives of local employers and workpeople, of the local education authority, and generally include independent persons with a knowledge of, and interested in, questions affecting juvenile employment.

Juvenile employment committees in Great Britain are generally responsible for collecting and disseminating knowledge about the employment of boys and girls in their areas and, by approaching employers and local and central Government authorities, for securing improvements in the conditions of juvenile employment, *e.g.* by extending the practice of apprenticeship, formulating other less formal methods of systematic industrial training and securing the abolition of blind alley occupations by more scientific methods of transfer and promotion. The committees undertake at special meetings of "rota" sub-committees to advise children and their parents upon the available openings in local industries, and in doing so they usually emphasize the value of choosing employment which offers opportunities for definite training. In many cases arrangements are made for the supply to the juvenile employment committee of reports from the elementary schools upon all children at the end of their school life. This assists the committee in giving advice as to the employment which seems suitable for individual children and is also of value when the committee is called upon to deal with children who have fallen out of work within a year or two of leaving school. The committees naturally coöperate with other agencies concerned with the welfare of boys and girls (care committees, juvenile organizations committees, clubs, etc.), and they sometimes maintain schemes of "after-care" for keeping in touch with employed children in their area in order to help them in any difficulties which may arise. The degree of elaboration in the work of juvenile employment committees and its value varies very widely. The work of the committees depends largely upon the zeal and knowledge of the members and upon the quality of the officials of the employment exchanges and of the local education authorities whose duty it is to carry out many of the decisions of the committees. During the year ending Nov. 12 1920, more than 500,000 children under 18 years of age, the number of boys and girls being practically equal, came within the purview of juvenile employment committees.

*The Effect of the War.*—The most authoritative estimates of the fluctuations in the number of persons employed in various industries and callings during and after the war are those prepared officially upon the basis of sample returns obtained from selected employers. They relate to an estimated total employed population under 18 years of age of 1,923,000 in 1914. The table on next page shows separately for boys and girls the changes which are estimated to have occurred in the number employed as at Nov. 1918 (the Armistice), and at July 1920, when normal industrial conditions had been largely reëstablished and industry was prosperous.

These figures indicate first of all an absolute increase, since July 1914, in the numbers of boys and girls employed during and after the war. This increase occurred mainly among the girls because among them alone was there any large reserve of unoccupied labour. There was, however, during the war a marked increase, although not upon a large scale, in the number of partial and total exemptions from school attendance before the age of fourteen. The position in this respect was practically normal by July 1920.

Secondly, the figures show the directions in which the fresh supplies of juvenile labour which became available during the war were used, and the industries from which juveniles were attracted to war work. Thus among both boys and girls there was a marked reduction in the numbers employed in the textile and paper and printing groups; in the number of boys engaged in finance and commerce and in the civil service (the Post Office is responsible for the larger part of the reduction); in the number of girls employed in the clothing group. On the other hand, there were large increases in the number of boys and girls employed in the "war industries," predominantly in the metal and chemical groups. The number of boys increased in mines and quarries; upon the production of food, drink and tobacco; in the wood industries and in transport. The number of girls employed also increased in the last-named, and large numbers entered "finance and commerce" and the civil service, in these cases no doubt taking the place of boys and men who passed to other occupations, including service in the forces.

The war had other important effects upon juvenile employment. At the outbreak of hostilities in Aug. 1914, widespread unemployment was feared, and for a short period many boys and girls were out of work as the result of the reduction of their staffs which employers found prudent in view of uncertainty as to the future. By the beginning of 1915, however, boys found little difficulty in obtaining employment. Enlistment of men for the forces was already making

[1] In the majority of areas in England total exemption cannot be obtained under 13 years of age.

vacant places to which the elder boys could be promoted and the issue of war contracts was beginning to have its effect upon the demand for labour of all kinds. The demand for girls for war work came rather later, as the number of boys transferred to work done hitherto by men increased, and as the manufacture of munitions of war of all kinds was developed upon a basis of routine processes upon many of which boys could be employed in very large numbers. The majority of the boys who were attracted to war work were employed upon such routine processes, and at the same time the proportion of boys to the total number of boys and men employed increased. This followed partly from the general extension of routine processes and partly from the promotion of boys to do the work of men. The girls who were drawn into war work also took part in the performance of routine processes, and, as indicated already, they entered such occupations as that of clerks in banks, insurance offices and commercial houses from which men and boys had been drawn away.

In so far as boys and girls took the places of men, they obtained opportunities of doing work of a higher grade than would normally have fallen to them at such an early age. Any advantages which might have followed from such causes were, however, more than counterbalanced by the general character of the work of producing munitions of war. As the war proceeded, routine processes were multiplied. Work was standardized so as to secure a large and certain output. With the increasing shortage of skilled workmen it became increasingly necessary to limit the demand for them, and this alone provided a strong inducement to extend routine work. At the same time the rates of wages paid to juvenile workers, especially to boys, steadily increased; and by 1917 boys of 15, who before the war might have been earning from 10s. to 15s. a week, were earning as much as £2 and £3 a week upon working automatic machines. The educational value of such work was negligible. The boys expected to join the army upon reaching the age of 18; wages were constantly rising and the demand for boy labour was very strong. Many boys found themselves, in the absence of their fathers and elder brothers with the forces, the principal wage-earners of their families. In such circumstances it was not in human nature that they should care about the effect of the work which they were doing upon their prospects as adult workmen in industry. Boys constantly changed their place of employment in pursuit of higher wages; the strain of the work was severe, and constraint upon their actions outside the factory was generally lacking. While, therefore, the work done by boys and girls in the munitions factories was of essential value, it did not provide a favourable environment in which to pass the years leading to manhood and womanhood.

During the war the juvenile employment committees took such action as was possible to meet the exceptional conditions. They, in common with boys' clubs and other agencies interested, were, however, much handicapped by the service of many of their members and officials with the forces or upon war work of other kinds. Committees were not formed in new centres during the war and the committees already in existence were largely occupied with the conditions in which juvenile workers were employed in war industries. It was found necessary to draw, through the employment exchanges, considerable numbers of boys and girls from a distance to work at such centres as Woolwich Arsenal and in the shipyards on the Clyde. The juvenile employment committees endeavoured to ensure that the arrangements both inside and outside the workshops were satisfactory. They encouraged the appointment by the employers of "Welfare Supervisors" and interested themselves in the arrangements made at the hostels in which juvenile workers were lodged. They collected information as to the effects upon juvenile workers of the exceptional working conditions (long hours, night work, the effects of monotonous employment, etc.), and in a number of cases they were able to secure important reforms in the arrangements made. Responsibility for the welfare of munitions workers rested during the war with the Ministry of Munitions, and much was done to obtain proper industrial conditions for juvenile workers.

In addition to the powers which they possess under the Factory Acts in regard to health, sanitation, safety, the hours of work of women and young persons, etc., the Home Office, under the Police, Factories, etc. (Miscellaneous Provisions) Act, 1916, may by order, when the circumstances of the work warrant it, require employers to make reasonable provision for the welfare of the workers in regard to such matters as supply of protective clothing, canteen arrangements, supervision, etc.

During the war careful consideration was given to the measures for dealing with juvenile employment which would be necessary upon the return of peace. The juvenile employment committees undertook extensive inquiries in 1916 and 1917 into the conditions of juvenile employment, the changes which the war had produced and the situation which would probably arise at the end of the war. In the report of a departmental committee on juvenile education in relation to employment after the war, and in a report upon "Juvenile Employment, During the War and After," issued in 1918 by the Ministry of Reconstruction, the evidence so obtained was examined. Both reports recommended an extension of juvenile employment committees and the opening during the demobilization period of "Unemployment Centres" at which boys and girls could attend to receive continued education with a maintenance grant during unemployment. The report of 1918 further recommended a number of measures for avoiding the sudden discharge of large numbers of juvenile workers at the end of the war, and for avoiding juvenile unemployment by the general and immediate use of the powers given by the Education Act, 1918, to require extended compulsory education. The reduction of normal working hours for juvenile workers in industry was also recommended.

With the beginning of the demobilization period at the end of 1918 action was taken in accordance with several of these recommendations. Juvenile employment committees of a permanent or temporary character were set up in districts in which it seemed probable that any extensive dislocation of juvenile employment would occur. So far as possible the discharge of juvenile workers was carried out gradually by arrangement with employers. Employers were asked to give juvenile employment committees advance notice of pending discharges of juveniles, in order that, so far as possible, the committees could gauge the extent of unemployment amongst juveniles and make alternative provision for those juveniles for whom other employment could not immediately be found.

*Educational Centres for Unemployed.*—Early in 1919 arrangements were made by the education departments with the local education authorities for special centres to be opened at which unemployed boys and girls could attend, usually for five days a week. The objects with which these centres were established were to occupy the time of unemployed boys and girls by mental and physical instruction and to prevent them from wasting their days in the streets. Means to ensure attendance was provided by the out-of-work donation scheme, under which unemployed boys and girls were entitled to substantial payments (at the outset 14s. 6d. for boys and 12s. 6d. for girls) each week during unemployment. Educational centres were opened in most areas in which it was likely that a

NOTE.—The comparison above is affected by the fact that the juvenile age limit was raised at the end of 1918 from 17 to 18.

considerable number of juvenile workers would be unemployed, and the payment of out-of-work donations was made conditional upon regular attendance at the centres. Attendance at a centre was accepted in lieu of attendance at an employment exchange as proof of unemployment, and arrangements were made to inform boys and girls at the centres of any suitable opportunities of employment which might occur. Twenty-eight centres were open at the beginning of Jan. 1919, and they were attended by over 3,000 boys and girls. A month later the number of centres had increased to 116 and the number of daily attendances to more than 13,500. There was a steady increase in the provision made up to the middle of April, when there were 215 centres open. The largest number of attendances was reached at the beginning of April, when the number was nearly 24,700. The attendances fell off from that date with the gradual absorption of boys and girls in industry and as the result of a strict review by juvenile employment committees of claims to grants of extended out-of-work donation. The scheme was wound up with the termination of the payment of out-of-work donation to civilians in Nov. 1919. The local education authorities undertook a difficult task in opening the centres. They found much difficulty in obtaining suitable teachers, and it was not easy to devise a satisfactory curriculum for the fluctuating attendance of boys and girls of all ages from 15 to 18. As a rule it was sought to make each day's teaching self-contained. The subjects taught included, for boys, drawing, practical measurements, workshop calculation, building construction, woodwork, physical exercises and organized games; and for girls, needlework, practical arithmetic, first aid, cookery, hygiene, home nursing, games, gymnastics, dancing and singing. At most centres there were also lectures on historical, literary, scientific or industrial subjects. It was only in rare cases that definite vocational training was attempted. The experiment met with a very considerable measure of success. The boys and girls who attended the centres accepted readily the necessary discipline, and responded very well to the instruction given. There can be no doubt that the centres were of much value in carrying very many juvenile workers over a difficult period.

The appended table shows the course of juvenile unemployment as recorded at the employment exchanges in the United Kingdom from Nov. 1918 (the Armistice) to the end of 1920.

*Education Act, 1918.*—The sections of the Education Act, 1918, which extend the ages at which education is compulsory, have the important effect upon juvenile employment of withdrawing, either wholly or in part, large classes of juvenile workers from industry. Thus [Section 9 (1)] children are to remain at the elementary schools until the end of the school term during which they reach an age at which they become entitled to leave school. This has the effect of raising the ages of school attendance by about 8 weeks upon an average. Section 8 (1) prohibits any exemption from school attendance before the age of 14, and Section 8 (2) permits local education authorities to increase this age to 15, with power to grant exemption between the ages of 14 and 15 in approved cases. These provisions were to operate at a date or dates to be determined by the Board of Education, but not before the formal termination of the war [Section 52 (3)]. Thirdly, by Section 10 continued education after the age of 14 is made compulsory during a minimum of 280 hours in the course of a year. This obligation rests upon children who become 14 after the "appointed day" for the commencement of the scheme in each area until they reach the age of 16 during the first seven years of the scheme and up to the age of 18 thereafter. Provision is made [Section 10 (6)] for such suspension of employment as will enable boys and girls who are required to attend at continuation schools to do so without undue physical and mental strain.

At the beginning of 1921, the Board of Education had named appointed days for the purposes of Section 10 in respect of the areas of the local education authorities in London, Birmingham, Rugby, Stratford-on-Avon and West Ham; but it had become temporarily necessary to refrain, in the interests of economy, from bringing the Section into operation elsewhere. (J. S. Nc.)

II. UNITED STATES.—Well-developed tendencies with reference to child labour legislation and reliance by employers on the employment of children in the United States were interrupted by the conditions created by the World War. The census of manufactures of 1914 showed that during the years before that date the number of children employed in manufacturing was decreasing. The serious industrial depression which followed the outbreak of the war brought a sharp decrease in the number of children employed in 1914, amounting to one-fifth of the number employed in 1913 in St. Louis and New York City, one-fourth in Buffalo and Rochester, N.Y., about one-third in Bridgeport, Conn., nearly one-half in Baltimore, and two-thirds in Manchester, N.H., a textile centre. By the latter part of 1915 the effect of foreign orders for war goods was beginning to make itself felt, and an unprecedented rise in the number of employed children followed. Except for isolated places affected by peculiar conditions, the increase in the number legally at work in 1916 over the number so employed in 1915 was very large, especially in centres where children had not been employed before. Reports to the U.S. Children's Bureau of the number of work permits issued showed that this increase was as high as 167% in Toledo, O.; 145% in Springfield, Mass.; 92% in Boston; and 63% in Indianapolis.

After the United States entered the war, the rising cost of living, the absence of older members of the family on military duty, high wages offered by employers to children because of the labour shortage, and a restlessness on the part of the children themselves led many under 16 years of age to leave school for work. Available statistics show that in most places the peak in the employment of children was reached in 1918. The shutting-down of war industries and the return of soldiers resulted in a temporary decline in the numbers in 1919, to be followed in 1920 by an increase in 18 out of 29 cities reporting to the U.S. Children's Bureau numbers of work permits issued. The end of 1920 saw a sharp decline as the result of the industrial depression. It should be noted that the figures given above are based on the number of work permits issued to children, and indicate therefore an increase in the number of children legally employed. Evidence is not lacking that there was difficulty in the enforcement of child labour legislation during the war period and that in consequence the number of children illegally employed during that time probably also increased.

In the field of legislation the most important development was the public demand for national control, which led to the first Federal child labour law, which went into effect Sept. 1917. This Act prohibited the shipment in interstate or foreign commerce of the product of any mine or quarry in which children under 16 were employed, and the products of any mill, cannery, factory, workshop or manufacturing establishment in which children under 14 were employed or children between 14 and 16 were employed more than 8 hours a day, or 6 days a week, or before 6 A.M. or after 7 P.M. This law was attacked as unconstitutional before it went into effect, and about nine months later (June 3 1918) the U.S. Supreme Court held, by a vote of 5 to 4, that it did not constitute a valid exercise of Congress's constitutional authority to regulate foreign and interstate commerce. A child labour tax clause was then inserted in the Revenue Act of 1918. It placed a 10% tax on the net incomes of establishments employing children of the ages and for the hours specified in the Act of Sept. 1, 1917. This law in June 1921 was before the U.S. Supreme Court for decision as to its constitutionality. In view of the fact that the Court has been in the habit of construing liberally the taxing power of Congress, friends of the measure expected its constitutionality to be upheld. In the child

labour legislation enacted by the various states there are many differences. The tendency is, however, for each state to require: (1) that a child must reach a specified age and an educational and physical standard before he can be industrially employed; (2) that an official work permit must certify his ability to meet the standards established by the statute; (3) that the age at which children or young persons may be employed at night or in hazardous or unhealthy occupations must be higher than the age at which they may be employed in general occupations. Of these standards the minimum age was the first to be generally adopted. With some exceptions, for vacation periods and certain occupations, every state except three (Mississippi, New Mexico, and Wyoming) has prohibited the employment in industry of children under 14 years of age. That the present tendency is toward the establishment of a higher age is indicated by the fact that seven states (California, Maine, Michigan, Montana, Ohio, South Dakota and Texas), representing all parts of the country, have raised the age for entering industry above 14 years. In 1920 seven states required completion of the eighth grade and nine of the sixth grade in school before a work permit could be issued to children between 14 and 16 years of age.

It is only recently that adequate recognition of the facts that the physical effects of premature employment are as serious as the educational, and that the age of a child is not a guaranty of his corresponding physical development, has become general in the United States. Eighteen states provide that although a child may be of the minimum age and have passed the educational test, he cannot go to work until he has had a physical examination by a public health or public school physician and has been found to be of normal development for a child of his age and physically fit for the work at which he is to be employed. In most states, if he fails to pass this test he must return to school pending correction of defects or improvement in his general condition. In 10 other states and the District of Columbia an examination may be required in all doubtful cases or at the discretion of the officer issuing work permits, and a permit may be refused if the child does not measure up to standard. The increased expenditures necessary for the effective administration of these laws indicate that the public has become converted to the need of a physical standard.

In all except six states child labour laws prohibit the employment of children at night in an enumerated list of occupations. The hours vary. For example, New York prohibits the employment of children under 16 years after 5 P.M. or before 8 A.M.; California after 10 P.M. or before 5 A.M. The Federal tax virtually establishes a minimum so that employment is in effect prohibited after 7 P.M. or before 6 A.M. in California and other states in which state laws are below the Federal standard in this respect.

In 27 states, including those of most importance industrially, laws prohibit the employment in certain unhealthy processes of children, the minimum age being usually 16 years, sometimes 18 years of age. While the lists of prohibited occupations are not identical, the recently enacted laws follow closely the so-called uniform child labour law. It prohibits children under 16 years of age operating or assisting in operating sandpaper or wood-polishing machinery; picker machines, or machines used in picking wool, cotton, hair, or any other material; carding machines; leather-burnishing machines; and prohibits their employment in any capacity in, about, or in connexion with any processes in which dangerous or poisonous acids are used; in the manufacture or packing of paints, colours, white or red lead; in soldering, in occupations causing dust in injurious quantities; in the manufacture or use of dangerous or poisonous dyes; in the manufacture or preparation of compositions with dangerous or poisonous gases; in the manufacture or use of compositions of dye injurious to health; and in assorting, manufacturing, or packing tobacco.

During the decade there was a great development of the earlier movement for manual training in the schools. The Smith-Hughes Act of 1917 offers to the states Federal reimbursement, up to a fixed maximum, of one-half of the money spent by the local boards for training teachers and providing vocational education in the public schools. Interest in vocational education has also greatly stimulated the establishment of compulsory part-time continuation schools in which vocational education is offered. A movement toward juvenile employment agencies also developed. It began with efforts by private organizations to place children in skilled trades and with advice in school as to employment opportunities. The development of vocational classes in the schools increased the appreciation on the part of school authorities of the value of this work. During the war a beginning was made in coördinating all the placement work for minors under the Junior Department of the U.S. Employment Service in the Department of Labour. At the end of the war the appropriation of the Employment Service was so reduced by Congress that there has been little development of this plan, but many of the bureaux established in connexion with the schools have increased in importance.

**KAHN, OTTO HERMANN** (1867– ), American financier, was born in Mannheim, Germany, Feb. 21 1867. His father had been among the refugees to America after the revolution of 1848 and had become an American citizen, but later returned to Germany. He was educated in a *Gymnasium* in Mannheim, and after a year's service in the German army entered a banking house. In 1888 he entered the London branch of the Deutsche Bank, remaining there five years and becoming a British citizen. In 1893 he went to the United States, and for two years held a position with the house of Speyer & Co. in New York City. Then after travel in Europe he joined the firm of Kuhn, Loeb & Co., in New York City. In March 1917 he became an American citizen. He was a patron of music and gave private assistance to promising talent. He was chairman of the New York committee of the Shakespeare Tercentenary (1916) and was vice-president of the Permanent Blind Relief War Fund. He was chairman of the board of directors of the Metropolitan Opera Co. of New York and of the French theatre of New York, and a founder and later treasurer of the New Theatre Co. He was a trustee of the Massachusetts Institute of Technology and of Rutgers College. He was a director in numerous corporations, including the Equitable Trust Co. (N.Y.) and the Union Pacific railway. During the World War he took a leading part in showing to the Germans in the United States that Germany was in the wrong and must be opposed. He was the author of *Right Above Race* (1918); *Our Economic Problems: A Financier's Point of View* (1920) and *Two Years of Faulty Taxation* (1920).

**KAHR, AUGUST RICHARD VON** (1862– ), Bavarian Minister-President from March 14 1920 to Sept. 20 1921, was born on Nov. 29 1862 at Weissenburg in Bavaria. After March 14 1920 he came into office under military influences as a secondary result of the Kapp *coup* (March 13) in Berlin. The most powerful party in Bavaria, the Bavarian *Volkspartei*, was then in a state of much anxiety as a result of the experiences of Bolshevism, anarchy and violence through which Munich had passed in the spring of 1919. The Ministry presided over by the Moderate Socialist Hoffmann had, it is true, succeeded in quelling Bolshevism with the aid of Republican troops from Prussia and Württemberg. The great majority of the Bavarian Catholic *Volkspartei*, however, as well as Liberals of various shades, not to speak of the Royalists and reactionaries, wanted further guarantees against a recurrence of the Bolshevist terror. The Kapp *coup* in Berlin, which in some of its aspects sprang from similar anxieties in Prussia, gave the signal for political action in Munich, and at a midnight sitting the Bavarian Socialist Ministry was somewhat unceremoniously hustled out of office—it is alleged under military pressure—and a Coalition Cabinet under von Kahr installed. The Coalition included reactionary Conservatives whose influence became more and more predominant. They were backed up by formerly Liberal Bavarian journals which had been bought up by the Prussian great industrialists. The new Minister-President had been *Landeshauptmann*—the highest position in the provincial administrative hierarchy—in Upper Franconia. He was known as a capable and energetic bureaucrat and as nothing else. Under his Government a formal state of siege was maintained, and the police under the reactionary prefect Poehner exercised the greatest severity in the supervision of foreigners and even of non-Bavarian Germans, who were only admitted to the country by special permit. Above all, von Kahr and his Ministry endeavoured to maintain the armed volunteer force, the *Einwohnerwehr*. But the Reichstag in Berlin had passed a law for disarmament of this force, and the Government of the Reich insisted that Bavaria, like the rest of Germany, should comply in this respect with the Treaty of Versailles, the Spa decisions and the reiterated demands of the Allied Powers. Repeatedly it seemed as if the conflict between the Government of the Reich and that of Bavaria would end in open rupture. In the late summer of 1921, however, the Bavarian Government—formally at any rate—gave way, and it was understood that, by arrangement, the *Einwohnerwehr* was surrendering its arms and equipment. A fresh conflict arose over the measures which were taken by the President of the Reich, Ebert, on the advice of the Ministry of the Reich, as a sequel to the assassination of the Democratic Catholic Centre leader Erzberger (Aug. 26 1921). Orders were issued from Berlin for the suppression of several Bavarian newspapers which had been indulging in violent denunciation of Erzberger, the Republican constitution and the Government of the Reich. Von Kahr and his Ministry questioned the right of the Reich to apply such measures to one of the German federated states without previous arrangement, or at least consultation, with the Government of that state. A serious complication was that the attitude of the Bavarian Government was supported by the Prussian reactionaries, several of whom, like Ludendorff, had taken up their residence in Bavaria and were hoping to make it the centre of an anti-Republican or Royalist movement for the whole of Germany. The Government of the Reich, under Dr. Wirth as Chancellor, manifested considerable firmness, and ultimately in Sept. 1921 von Kahr resigned and was succeeded as Minister-President by the minister in Darmstadt, Count Lerchenfeld, a man of experience and character, who commanded the confidence of the Catholic *Volkspartei* and of the Bavarian Liberals of all shades.

**KALA-AZAR**, or Black Fever (*see* 15.637*), a disease first described in 1882 as a chronic form of malaria, or malarial cachexia, prevalent at the foot of the Garo Hills at the W. end of the range separating the Brahmaputra or Assam valley on the N. from the Sylhet valley on the S. in India. From 1882 it spread steadily up the Assam valley along the Grand Trunk Road to the S. of the Brahmaputra river. Travelling at a rate of about 10 m. a year in a wave of greatly increased mortality, leaving behind a few sporadic cases of the disease, it culminated in such a terrible outbreak in the Nowgong district during the first decade of the 20th century that there was a decrease of 31.5% in the population, against an increase of 8 to 16% in the more easterly unaffected districts, while much land fell out of cultivation. The epidemic carried off about one-third of the population over a narrow tract of country 250 m. in length in the course of 30 years, while various places on the N. bank of the Brahmaputra river were also affected to a lesser extent.

In 1889 an investigation of the epidemic was carried out by a selected medical officer, who found hook-worm ova in the evacuations of many of the cases, and reported the disease to be ankylostomiasis—a theory which was soon disproved by the discovery that a larger proportion of healthy coolies imported into Assam after two medical inspections harboured these worms than did kala-azar patients. In 1896 Sir Leonard Rogers investigated the disease for the Government and wrote the first full description of it, but found no means of distinguishing it from what had always been known as malarial cachexia, which had long been sporadic in the Sylhet valley, except that it was more severe with a shorter duration and higher mortality. He concluded that it was an epidemic malaria, an opinion which was endorsed by the high authority of Sir Ronald Ross after a personal investigation in Assam in 1899. Rogers also obtained strong evidence of the disease being communicable, the infection being a very local or house one, and made recommendations based on this discovery for dealing with the disease in infected tea-gardens and to check its further extension up the Brahmaputra valley, a natural obstruction to which existed in the shape of the sparsely populated Mikir Hills to the E. of the Nowgong district. These measures resulted within the next few years in the disease being stamped out of a number of tea estates and the cessation to a great extent of the further spread of the epidemic, for over 10 years later the distribution of the disease in Assam was still the same, although a limited fresh outbreak appeared in the more easterly Sibsagar district a little later.

**These figures indicate the volume and page number of the previous article.*

It was not until 1903 that the problem of the true causation of kala-azar was solved, for after Dutton had discovered the first human trypanosome in an African fever, later shown by Sir David Bruce to be an early stage of sleeping sickness, Sir William Leishman recorded having found some time earlier small oval binucleated bodies in the spleen of a fatal case of kala-azar, which he now suggested were degenerate trypanosomes. Col. Donovan, I.M.S., at once reported that he had independently discovered the same bodies in malarial cachexia cases in Madras, and he proved that they were not degenerate trypanosomes, as they could be obtained by puncturing the spleen during life. Sir L. Rogers and Dr. Bentley soon after found the same parasites in the epidemic kala-azar of Assam. In 1904 the former cultivated the protozoal parasite and obtained the development of a flagellate stage, and it was eventually named *Leishmania donovani* in honour of the joint discoverers. Further cultural studies led him to suggest the bed-bug as the probable carrier of the infection, and later Maj. Patton, I.M.S., and others obtained development of the flagellate stage in these insects after feeding them on the blood of kala-azar patients; but the complete life-history of the parasite has not yet (1921) been worked out.

In 1904 a Mediterranean, or infantile, form of kala-azar was discovered, affecting mainly children, most prevalent in Tunis and other N. African countries, and to a less degree on the N. shores of the Mediterranean, extending from Spain, Sicily and southern Italy and Greece to Asia Minor and the Sudan. Dogs were found infected (though they are not with Indian kala-azar), and the dog-flea is suspected of conveying the infection.

Kala-azar may be briefly described as a very prolonged fever, accompanied by great enlargement of the spleen, and in the later stages of the liver, with marked emaciation, leading to its having been confused with the so-called malarial cachexia in India, which is now known to be nothing but sporadic kala-azar, still widely prevalent over Bengal, Bihar, Western United Provinces and on the Madras coast, but absent, except as rare imported cases, from the more westerly portions of India.

The fever is very varying in its character, but frequently presents for a time a characteristic double rise of temperature in the 24 hours of diagnostic importance. The persistent nature of the fever and the failure of full doses of quinine to check it quickly is most important in differentiating it from a true malarial fever. In the Assam epidemic form the average duration of the disease was seven months, sometimes without complete cessation of fever for a single day, while in the sporadic form it often lasts several years with periods of temporary freedom from fever. Another feature of diagnostic and prognostic importance is the remarkable decrease of the leucocytes, or white corpuscules, of the blood, which are commonly reduced to from one-third to one-fifth of the normal numbers; an extreme fall being of serious import, as the consequent loss of resisting powers against microbial invasion is the usual cause of fatal terminations due to secondary septic infections, including terrible sloughing of the tissues of the cheeks in children, dysentery, pneumonia and phthisis, which are the common causes of death in kala-azar, the fever of which is comparatively seldom fatal in itself. The mortality in the Assam epidemic form in hundreds of cases, carefully treated from first to last on tea estates by Dr. Dodds Price, was no less than 96%, while it was not very much less in the sporadic form in other parts of India. The very prolonged nature of the disease and its excessive mortality constitute kala-azar one of the most terrible diseases which afflict mankind.

Up to 1915 the treatment of the disease was very unsatisfactory, although Rogers obtained 25% of recoveries by measures to increase the leucocytes of the blood. The close resemblance in many ways between kala-azar and African trypanosomiasis terminating in sleeping sickness, together with the zoological affinities of the flagellate organisms of the two diseases, raised the hope that any drug which proved efficient in trypanosomiasis might very likely also be effective in kala-azar, while the fact that rats and other animals could be infected with human trypanosomes and the effect of various drugs tested experimentally on the disease in them, eventually solved this serious problem. Various arsenical preparations, which had proved of some value in trypanosomiasis, produced little effect in kala-azar, but when tartar emetic intravenously was found to be of value in the former, it was also tried by several workers in kala-azar with complete success. Di Cristina and Caronia, of Palermo first reported cures of the Mediterranean form of kala-azar early in 1915, and Sir L. Rogers, who was at the same time using the drug quite independently in India, very shortly after recorded its curative action in Indian kala-azar, and later showed that sodium antimony tartrate and a new preparation, colloid antimony sulphide, were less toxic and rather more effective than the first-used tartar emetic or potassium antimony tartrate, and reported 35 cases in Europeans with only one death from complicating phthisis and 29 complete and lasting cures, so that about 90% of these unfortunate patients can now be rescued from almost certain death. Moreover the new treatment has proved of great value in controlling the recent focus of the epidemic disease, while the sporadic form had in 1921 nearly disappeared from a portion of the Bardwan district of Bengal, where numerous cases had been treated, so that there was good reason to believe that kala-azar could eventually be stamped out. The results obtained by segregation methods and the new treatment thus constitute one of the greatest triumphs of modern medical science. (L. Ro.)

**KALEDIN, ALEXEI** (1861–1918), Russian general, was born in 1861, and entered the army in 1882. For some years he served in the artillery and then, on passing out of the General Staff Academy in 1889, he was appointed on the general staff. He reached the rank of general in 1907, and when the World War broke out in 1914 he was at the head of the 12th Cavalry Division. With this division he served in the Galician campaigns of 1914–5, in which his marked qualities of leadership soon showed themselves. In March 1915 he was seriously wounded. Later in 1915 he commanded the XII. Corps, and in the beginning of 1916 the VIII. Army. With this army, in 1916, he carried out the great offensive campaign of Lutsk. More than 100,000 prisoners and much booty were the results of his summer battles. In May 1917, being out of sympathy with the policy of the Provisional Government, which was causing the disintegration of the army, he resigned his post as an army commander. In the summer of the same year he was elected Ataman of the Don. His popularity among the Cossacks did not cease, even after the conflict between Kornilov and Kerensky. Notwithstanding the latter's demand that Kaledin should come to Moscow to explain his conduct during the Kornilov affair, the Cossack parliament forbade him to go, fearing some treachery in relation to Kaledin. After the seizure of power by the Bolsheviks and the conclusion of their armistice with the Germans, he called up the Cossack regiments to the Don. The great moral influence he exercised over the Cossacks kept them at first from internal anarchy and aroused them to an armed defence of the Don district against invasion by the Bolsheviks. He thus made it possible for Generals Alexeiev and Kornilov, in Dec. 1917, to muster the troops of the Volunteer Army to the south of the Don district. But in the beginning of 1918 an inner fermentation began on the Don; on the front the Cossacks began to surrender to the Bolsheviks. The Volunteer Army left the Don and went to the Kuban district. When all means of saving the Don Cossacks from Bolshevism were exhausted, Kaledin, hoping even at the last to rally the Cossacks by an act of self-devotion, shot himself on Feb. 11 1918. (N. N. G.)

**KANSAS** (*see* 15.654).—The pop. of Kansas in 1920 was 1,769,257, as against 1,690,969 in 1910, an increase of 78,288 or 4·6%. Relatively to the other states, Kansas lost its position, falling from 22nd to 24th place. Of the 105 counties, 48 showed an increase and 57 a decrease in pop. during the decade. The average number of inhabitants to the sq. m. was 21.6 in 1920. There were three cities of over 25,000 inhabitants, 14 from 10,000 to 25,000 and 10 from 5,000 to 10,000. The urban pop. (in cities of over 2,500) increased from 29·2% in 1910 to 34·9% in 1920.

The following are the cities with over 12,000 inhabitants, with pop. in 1920 and 1910 and percentage of increase:—

| | 1920 | 1910 | Per cent Increase |
|---|---|---|---|
| Kansas City | 101,177 | 82,331 | 22·9 |
| Wichita | 72,217 | 52,450 | 37·6 |
| Topeka | 50,022 | 43,684 | 14·5 |
| Hutchinson | 23,298 | 16,364 | 42·4 |
| Pittsburg | 18,052 | 14,755 | 22·3 |
| Leavenworth | 16,912 | 19,363 | −12·7 |
| Parsons | 16,028 | 12,463 | 28·6 |
| Salina | 15,085 | 9,688 | 55·7 |
| Coffeyville | 13,452 | 12,687 | 6·0 |
| Atchison | 12,630 | 16,429 | −23·1 |

*Agriculture.*—Kansas is preëminently an agricultural state. It is the largest producer of wheat and corn taken together in the Union, although the wheat crop is in some years exceeded by North Dakota and the corn crop in some years by Illinois. The wheat crop was 61,000,000 bus. in 1910; production was increased by 1914

to 96,000,000 bus.; in 1920 it was 140,000,000 bushels. The corn crop was 152,000,000 bus. in 1910 and despite increase in area planted in wheat, 132,000,000 bus. in 1920. The crops next in value were alfalfa and oats. High prices of agricultural produce during the World War brought great prosperity to the state, but the slump in the winter of 1920–1 reduced prices below the cost of production and created acute depression. Despite increase in the area under cultivation, the number of individual farms decreased from 177,841 in 1910 to 165,287 in 1920.

*Mineral Products.*—There are considerable deposits of bituminous coal along the eastern border of the state and production amounted in 1920 to 7,500,000 tons. Natural gas reached its peak in 1908 with a yield of 80 billion cub. ft., after which the yield gradually decreased to 27·8 billion cub. ft. in 1920. There has been little effective control of the distribution of gas, and distributing companies have fixed rates in total disregard of their original contracts. The most striking development of the decade in this field has been in the production of petroleum which stood at only 3,000,000 bar. in 1914, jumped to 36,500,000 in 1917, reached the peak at 45,500,000 in 1918 and stood at 34,000,000 in 1920. The supply of materials for cement seems inexhaustible and the value of this product is exceeded only by oil, coal and gas. Kansas ranks fourth in the Union in the production of salt, of which the production in 1920 was reported by the State Geological Survey at 873,576 barrels. The Joplin zinc and lead field overlaps the S.E. corner of the state, but while the field approaches exhaustion on the Missouri side, it is capable of indefinite development in Kansas. The output in 1920 was 20,249 tons of zinc and 3,025 tons of lead.

*Manufactures and Transportation.*—Federal statistics distinguish 36 industrial groups in each of which the value of the annual output exceeds $300,000. The state issued an *Industrial Directory* in 1919 which presented a preliminary survey of all the establishments engaged in any kind of manufacture. The larger interests were based upon products of agriculture. The largest is the slaughtering and packing of meat, which produces almost one-tenth of the total output of the United States. The State Board of Agriculture valued the animals slaughtered and sold for slaughter in 1920 at about $105,000,000. Nearly the whole of this industry is localized in Kansas City. The next largest interest is the milling of flour, which is widely distributed over the state. During the year ending June 30 1920, 18,000,000 bar. of flour was milled. Slaughtering and milling together contribute considerably more than half the value of the manufactured products of the state. Railways and the industries subsidiary to them employ a large part of the labour of the state. The railway mileage was 9,006 in 1910 and 9,525 in 1915, but construction was suspended during Federal control and mileage declined in 1920 to 9,352. Electric interurban railways (mileage 512 in 1920) have developed less rapidly than in more thickly settled states.

*Constitution.*—Kansas in 1921 was still governed by her original constitution, adopted in 1859. Twenty-one amendments were made prior to 1910 and six have been added since that time. Unlimited suffrage was extended to women in 1912 (they had enjoyed municipal suffrage since 1887), and under pressure of the World War the suffrage was limited in 1918 to citizens of the United States. Provision was made for recall of public officers in 1914, but the Supreme Court (*State* v. *Deck*, 106 Kans. 518) decided that the clauses are not self-executing, in that they make no provision for special elections, and the Legislature has not seen fit to give them effect. As the result of a campaign for a stable income for the state educational institutions, the Legislature was authorized in 1918 to levy a permanent tax for their support but in 1921 had failed to act. In the face of a constitutional requirement that all property be taxed at a uniform rate, it had not been possible to make any progress in the direction of tax reform. In 1915 the Legislature attempted to reach intangible property by an Act exempting from taxation all mortgages on which a certain registration fee had been paid, but the Supreme Court (*Wheeler* v. *Weighman*, 96 Kans. 50) held that the Act involved a classification of property and was therefore unconstitutional. An amendment had been submitted in 1914 and was resubmitted in 1920, permitting the classification of property for purposes of taxation but on both occasions was rejected. Two amendments were adopted in 1920. One, resulting from the efforts of Gov. Allen to reduce farm tenantry, authorized the creation of a fund to assist in the purchase of farm homes. The other so far removed the prohibition of state action in works of internal improvement as to allow the state to assist counties in building roads. No action was taken by the succeeding session of the Legislature under either head. It is a conspicuous fact that the amendments adopted by the people during the decade 1910–20, depending for execution upon legislative action, were not given effect.

*Legislation.*—The Legislature met in biennial sessions from 1911 to 1921 and in special session in 1920. Except for the "blue sky" law and the Act establishing a Court of Industrial Relations, legislation has followed the drift in other states. The "blue sky" law, for the regulation of investment companies, was passed in 1911 and amended in detail in 1913 and 1915. It prohibits the sale in the state of stocks not approved by a board, consisting of the Secretary of State, and Attorney-General and the State Bank Commissioner, and thus prevents the floating of worthless securities. It has been extensively copied in other states. Another step in advance was the Act of 1913 which provides for the nomination and election of judges by separate ballots without party designation. During the decade 1910–20 the management of all of the state's institutions was highly centralized. The first step was taken in 1913 by placing all the educational institutions under a single Board of Educational Administration, consisting of three members, and in 1917 all the institutions, educational, charitable and correctional, were placed under control of a State Board of Administration, consisting of three members and the governor as chairman *ex officio*. The Act was based on the manager idea, according to which the head of each institution is chosen by the Board and held responsible for the administration of his own institution. It is open to question whether the duties of such a board are not too diverse. There is also danger that the change may lead to political interference with the internal management of the educational institutions, but no such tendency had developed by 1921. The expectation that the Legislature would accept the estimates of the Board as to the financial needs of the various institutions had not been realized. An attempt made by Gov. Capper in 1917 and renewed by Gov. Allen in 1921 to consolidate on a similar plan the various bureaus that compose the State Board of Agriculture did not succeed. In 1911 the State Board of Railroad Commissioners was superseded by a Public Utilities Commission, modelled on the commissions already established in New York and Wisconsin, to which was given supervision of all public utilities in the state. In 1919 a general strike in the coalfield suspended production and threatened a coal famine in the midst of an exceptionally severe winter. Gov. Allen took over the coalmines and began their operation by means of volunteers recruited chiefly from among the students in the educational institutions, and called the Legislature in special session to provide against the recurrence of such conditions. The result was the passage in 1920 of an Act which created a Court of Industrial Relations, consisting of three members. The Act declared the manufacture of food and clothing, the mining of fuel and transportation to be essential industries and "affected with a public interest" to such a degree as to justify public control. The right of collective bargaining was recognized but strikes were prohibited and the Court was given authority, either on its own initiative or on complaint, to investigate and to issue orders regulating limitation of production, hours and conditions of labour and rate of wages. Appeal from the orders of the Court may be taken to the civil courts. Originally the Public Utilities Commission was merged in the Industrial Court but at the regular session of the Legislature in 1921 the former was reëstablished as a separate body and the Labour Bureau and the Industrial Commission were merged in the latter. The purpose of the Court of Industrial Relations is to protect the interests of the public as between the employer on the one hand and labour on the other and to avert industrial war. The Court was not entirely satisfactory either to the employer or to labour, but it constituted the most interesting experiment that had been made in this field during the decade and the outlook was encouraging. The Act establishing the court was sustained by the State Supreme Court.

In some other directions legislative progress has been less satisfactory. An Act of 1903, prohibiting discharge of workmen on account of union membership, was lost through judicial interpretation. The Act was sustained in 1912 by the Supreme Court of the state (*Kans.* v. *Coppage*, 87 Kans. 752) but in 1915 was held by the U.S. Supreme Court to be a taking of property without due process of law, in that it curtailed the employer's right to make contracts on the most favourable terms (*Coppage* v. *Kans.* 236 U.S. 1), In 1915 the Legislature created a Civil Service Commission, consisting of three state officers, one of them to be a member of the faculty of the state university, and all serving without compensation. The Commission functioned as well as the inadequacy of the law would admit, but in 1921 employees in the State Banking Department were removed from its control and the Commission was left without appropriation for contingent expenses. The state thus reverted to the spoils system. The laws respecting child labour, budget and workmen's compensation were not regarded as satisfactory. A commission was created in 1919 to draft a law upon workmen's compensation, but in 1921 no action had been taken upon its report. An act of 1919 prohibited the use of a red flag or of any flag emblematic of "bolshevism, anarchy or radical socialism." A bill, passed in 1921, requiring voters in primary elections to register their party affiliations in advance, was prevented from becoming law only by the veto of the governor. Acts passed in 1907 and amended in 1909 provided for the adoption of commission form of government in cities of the first (over 15,000 inhabitants) and second (between 2,000 and 15,000) classes. Fifty-two cities, including all those of the first class, had availed themselves in 1921 of this opportunity and the question was pending in several others. The cities that have acted more recently have favoured a combination of the commission and city-manager plan. Of the 525 cities in the state, 158 are members of the Kansas League of Municipalities which maintains a monthly bulletin, entitled *Kansas Municipalities*, edited by the secretary and published at the state university. Taken as a whole, the legislation of the decade hardly sustained the reputation enjoyed by Kansas as being particularly radical in its measures. More progress in this direction would doubtless have been made but for the World War and its reaction.

*History.*—Kansas has been overwhelmingly Republican in politics and there has been practically no Democratic press in the state. W. R. Stubbs was elected governor in 1909 and re-elected in 1911, as representative of the reform wing of the Republican party. Under the leadership of William Allen White, Victor Murdock and Henry J. Allen, the reform wing of the party joined the Progressive movement and the primaries in Aug. 1912 declared for Roosevelt for presidential nominee. The division in the Republican ranks resulted in giving the electoral vote of the state that year to Wilson and in the election of a Democratic governor, George H. Hodges. In 1914 the Republicans regained control of the state Government by the election as governor of Arthur Capper, owner of the Topeka *Capital* and of a group of farm papers, and he was reëlected in 1916, although the electoral vote of the state again went to Wilson. Henry J. Allen, Republican, owner of the Wichita *Beacon*, was elected governor in 1918 and reëlected in 1920. In the latter year the electoral vote for President went to Harding by enormous majorities. The World War was enthusiastically supported by all parties. One of the larger training camps, named from Gen. F. Funston (who died early in 1917), was located on land adjoining the Fort Riley military reservation. The state supplied 63,428 men to the rank and file of the army. The amounts subscribed to the war loans were: First Liberty Loan, $11,108,750; Second, $27,895,200; Third, $47,381,200; Fourth, $73,914,550; Victory Loan, $51,208,250.

*State Documents.*—Session laws and Senate and House journals are issued after each legislative session. The last edition of the *Compiled Statutes* was issued in 1915. A complete revision was in preparation in 1921. Reports of executive departments are brought together in a collective volume entitled *Combined Department Reports.* Other important publications are the *Biennial Reports* of the State Board of Agriculture and the State Board of Health and the Collections of the State Historical Society. The State Library issued in 1920 a reprint of the *Proceedings* of the Constitutional Convention of 1859, with much supplementary historical matter, edited by H. G. Larimer. (F. H. H.*)

**KAPP, WOLFGANG** (1868– ), German conspirator, the author or chief instrument of what is known as the Kapp *coup d'état* (or *Putsch*) of March 13 1920, was born in New York July 28 1868. He was the son of one of the leading German Liberals of 1848, Friedrich Kapp, who, when the reaction triumphed, had sought refuge in America and remained there until the establishment of the German Empire by Bismarck in 1871. Friedrich wrote books which had a considerable vogue on the history of German immigration into the United States and on the question of slavery. He returned to Germany and was a National Liberal member of the Reichstag until he separated from Bismarck on the question of protection. His son Wolfgang grew up under Bismarckian influences, and after an ordinary official career became the founder of the Agricultural Credit Institute in East Prussia, which achieved great success in promoting the prosperity of landowners and farmers in that province. He was consequently in close touch with the Junkers of East Prussia, and during the World War made himself their mouthpiece in an attack on the Imperial Chancellor Bethmann Hollweg published in 1916 under the title of *Die Nationalen Kreise und der Reichskanzler.* This pamphlet appeared about the same time as the attacks of "Junius Alter" and evoked an indignant reply from Bethmann Hollweg in the Reichstag, in which he spoke of "loathsome abuse and slanders." Kapp continued his campaign against the Government, and was one of the chief founders of the *Vaterlandspartei* under the auspices of Tirpitz. For a brief period before the Revolution he was a Conservative member of the Reichstag.

Nothing more was heard of him until on March 12 1920 the Republican Government of the Reich suddenly issued an order for his arrest. It turned out that he had organized, with Gen. von Lüttwitz and other officers, a conspiracy to seize power in Berlin and to occupy the Government offices. Noske, the Socialist Minister of National Defence, had, with misplaced confidence, put Lüttwitz at the head of the troops which suppressed the Communist risings in Berlin. Lüttwitz, after delivering a kind of ultimatum to the Government, placed himself at the disposal of Kapp, and led the troops, which consisted mainly of the so-called "Baltikum" and other Free Corps, from the camp of Döberitz near Berlin into the capital in the early morning of March 13, where he occupied the Government buildings. Kapp was installed in the Imperial Chancellery and issued proclamations with his signature as "Chancellor of the Reich." President Ebert, Chancellor Bauer, and other members of the Ministry fled in motor-cars first to Dresden and afterwards to Stuttgart, where a meeting of as many members of the Reichstag as could be assembled took place. Meanwhile Kapp tried to form a Government, with a number of desperate and in part criminal characters in the subordinate offices. Well-known Conservatives and former secretaries of state, who were invited to assume the more important offices, declined to associate themselves with him. He endeavoured to negotiate with ministers who remained in Berlin, particularly with Schiffer, Minister of Justice. The chief grievances which Kapp and his followers professed to have against the Government were (*a*) that the National Assembly, which had been elected as a Constituent Assembly, was prolonging its existence and acting as a permanent Reichstag; (*b*) that this Assembly was manifesting an inclination to revise the constitution in respect of the election of the President of the Republic so as to make the election lie with the Reichstag instead of with the electorate of the country. There was something in these complaints, and in the sequel the date of the general election for the first republican Reichstag was hastened and was fixed for the following June, while all attempts to change the method of election for the presidency of the republic were abandoned.

The Government had no troops whom it could trust to put down the Kapp insurrection, but the working classes of Berlin took the matter into their own hands, and by a universal strike rendered the continuance of the Kapp "Government" impossible. The leading generals of the army, with the exception of Ludendorff, had at the same time informed Lüttwitz that his position and action were entirely irregular and that he must resign in the interests of the country. Kapp saw that the game was up, and on the evening of March 17 he and Lüttwitz fled from Berlin in motor-cars. The insurrectionary Government had lasted four days. The legitimate Government on its return to Berlin issued warrants for the arrest of Kapp, Lüttwitz and their associates. Lüttwitz entirely disappeared, but Kapp remained in hiding for a time on his East Prussian estates, and ultimately managed to escape by aeroplane to Sweden.

The effects of the Kapp *coup* throughout Germany were more lasting than in Berlin. On the one hand it led to a succession of Communist insurrections, of which the most serious was that which was suppressed by reactionary troops and with reactionary severity in the Ruhr region, March–April 1920. On the other hand it left a rump of military conspirators such as Col. Bauer, Maj. Pabst and Capt. Ehrhardt, who found refuge in Bavaria under the reactionary Government of Herr von Kahr (itself an indirect product of the Kapp *coup*) and there attempted to organize plots against the republican Constitution and Government of Germany. The crisis in the relations of Bavaria with the Reich (Aug.–Sept. 1921) which ended in von Kahr's resignation was a further phase of the same trouble.

**KAROLYI, MICHAEL,** COUNT (1875– ), Hungarian politician, was born on March 4 1875. He was at first an agrarian Conservative, and as such president of the Hungarian Agricultural Union, and then, as deputy, an adherent of the extreme Chauvinist party. He became the leader of the Radical wing of the Independence party (*see* HUNGARY), a personal opponent of Count Stephen Tisza, and led the parliamentary opposition and obstruction against him. In the spring of 1914 he travelled to America to collect among Hungarians resident there election funds for his party. The outbreak of war found him in France, where his companions were interned, but he was allowed to go free, and returned to Hungary. He entered the army as a volunteer. On the approach of the catastrophe he allied himself and his party with the anti-Chauvinist Bourgeois-Radicals and the Social Democrats, developed pacifist views, and sought to bring

an end to the war by preparing the way for the revolution. He was prime minister in the Oct. revolution, and was elected by the National Council on Jan. 11 1919 President of the Hungarian People's Republic. He handed over the Government on March 21 1919 to the Soviet Government, and after its fall emigrated to Czechoslovakia, then to Italy, but was expelled from there on Feb. 1 1921 on account of Communist propaganda. He then obtained permission to live in Yugoslavia.

**KATO, TAKAAKI [KOMEI]**, VISCOUNT (1859– ), Japanese statesman (*see* 15.696), resigned his post as ambassador in London in Dec. 1912. Returning to Japan, he joined the late Prince Katsura's third Cabinet as Foreign Minister for the third time, but resigned soon after. He then reorganized the Doshikai, created by Katsura, and renamed it the Kensei-kai or Constitutionalist party, becoming its president in 1913 (*see* JAPAN: *Political Developments*). In April 1914 he joined the Okuma Cabinet as Foreign Minister, resigning in the following August. In Aug. 1915 he was elected to the House of Peers.

**KATSURA, TARO,** PRINCE (1847–1913), Japanese soldier and statesman (*see* 15.697). In Aug. 1911 he resigned in favour of Marquess Saionji, having completed the work of financial reform and treaty revision he had undertaken, and received the rank of prince. On Dec. 20 1912 he again accepted office as premier, gallantly facing the difficulties due to lack of public confidence in the control of State policy by the *Genro* (Elder Statesmen). In Feb. 1913, however, a vote of censure on the premier was moved in the Diet for the alleged misuse of imperial rescripts, and on Feb. 11 the Prince resigned office and was succeeded by Admi. Yamamoto. His health was already failing and he died on Oct. 10 1913.

**KEANE, AUGUSTUS HENRY** (1833–1912), Irish anthropologist, was born at Cork June 1 1833. He was educated at Dublin and in Rome for the Roman Catholic priesthood; but he declined to enter the Church, and devoted himself to geographical and ethnological research (*see* 1.442; 9.900; 22.678). He registered and classified almost every known language, and from these data worked out a system of ethnology. He edited Stanford's *Compendium of Geography* and, besides many papers in the journals of learned societies and in encyclopaedias, published *Man, Past and Present* (1899); *Ethnology* (1896 and later editions); *The Gold of Ophir* (1901), etc. He was professor of Hindustani at University College, London, till 1885. He died Feb. 3 1912.

**KEANE, JOHN JOSEPH** (1839–1918), American Roman Catholic archbishop (*see* 15.706), died at Dubuque, Ia., June 22 1918. He had retired in 1911.

**KEARY, CHARLES FRANCIS** (1848–1917), English author, was born near Stoke-on-Trent, March 28 1848. Educated at Marlborough and Trinity College, Cambridge, he was for some years in the coins department of the British Museum. His first published work was *Outlines of Primitive Belief among the Indo-European Races* (1882), followed by several works on Norse history and mythology, *The Mythology of the Eddas* (1882); *The Vikings in Western Christendom* (1890) and *Norway and the Norwegians* (1892). In 1910 he published a philosophical work *The Pursuit of Reason*; but from 1889 onwards he devoted most of his time to fiction and verse. Amongst his novels may be named *A Marriage de Convenance* (1889); *Herbert Vaulennert* (1895) and *Bloomsbury* (1905); and amongst his poems, *Rigel, a Mystery* (1903) and *Religious Hours* (1916). He died in London Oct. 25 1917.

**KELLOGG, CLARA LOUISE** (1842–1916), American singer (*see* 15.719), died at New Hartford, Conn., May 13 1916. She was the author of *Memoirs of an American Prima Donna* (1913).

**KELTIE, SIR JOHN SCOTT** (1840– ), British geographer, was born at Dundee March 29 1840. He was educated at Perth, and afterwards at St. Andrews and Edinburgh. In 1861 he joined the editorial staff of W. & R. Chambers, of Edinburgh, and from 1871 to 1884 was employed by Macmillan & Co., being also for some years the sub-editor of *Nature*. In 1880 he was appointed editor of the *Statesman's Year Book*. He became in 1884 inspector of geographical education in connexion with the Royal Geographical Society, becoming librarian of the society in 1885 and its secretary in 1892. This position he held till 1915, when he was appointed joint-editor of the *Geographical Journal*. In 1917 he retired and in 1918 was knighted. Sir John Keltie has been the recipient of many honours from learned societies, including the Cullum gold medal of the American Geographical Society and the gold medals of the Paris and Royal Scottish Geographical Societies (1915), besides the Victoria medal of the Royal Geographical Society (1917). In 1897 he was president of the geographical section of the British Association. His best-known book is *The Partition of Africa* (1894), which is one of the standard works on the subject. He has also published *A History of the Scottish Highlands and Clans* (1874); *Report on Geographical Education* (1886); *Applied Geography* (1890; new ed. 1908) and *The History of Geography* (with O. J. R. Howarth, 1914); besides many articles in scientific and geographical journals. He acted during the winter of 1918–9 as a geographical adviser to the historical section of the Foreign Office.

**KENDAL, WILLIAM HUNTER** (1843–1917), English actor (*see* 15.727), died in London Nov. 7 1917.

**KENNEDY, SIR WILLIAM RANN** (1846–1915), English judge, was born at Dublin Jan. 14 1846. He was educated at Eton and King's College, Cambridge, where he had a distinguished career. He was called to the bar in 1871, and became a Q.C. in 1885. He joined the northern circuit and settled in Liverpool, where as an expert in shipping and mercantile cases he earned a very high reputation. He unsuccessfully contested Birkenhead in 1885 and 1886, and St. Helens in 1892, in the Liberal interest. In 1892 he was appointed a judge of the Queen's Bench division and was knighted, and in 1907 became a lord of appeal, being made a Privy Councillor in 1909. He died in London Jan. 17 1915.

**KENTUCKY** (*see* 15.740).—The census of 1920 ranked Kentucky as 15th state with a pop. of 2,416,630; in 1910 the state was 14th with 2,289,905. The gain of 126,725, or 5·5%, was numerically the least since 1840 and per cent the least since 1790. There were 1,227,494 males and 1,189,136 females. The whites numbered 2,180,560, an increase since 1910 of 7·5%; the negroes 235,938, a decrease of 9·8%. Foreign-born whites numbered 30,780, or 1·3% of the total pop., as against 40,053, or 1·7% in 1910. There were also 57 Indians, 62 Chinese, 9 Japanese, and 4 others. White men 21 years of age and over numbered 584,721; white women, 560,804; total, including negroes, 1,289,496, most of whom may vote under the new election laws of 1920. The density of pop. in 1920 was 60·1 to the sq. m.; in 1910, 57. The state remained overwhelmingly rural, despite a rise of urban pop. from 24·3% in 1910 to 26·2% in 1920. Sixty-four counties, widely scattered, lost pop. in the decade; while four in the eastern coal-fields gained 50% or more. In 1916 the Baptists claimed 367,731 members; Roman Catholics, 160,185; Methodists, 155,229; Disciples of Christ, 129,972; Presbyterians, 48,423; Church of Christ, 24,216; Episcopalians, 9,383. The eight cities with a pop. of over 10,000 in 1920 were:

| | 1920 | 1910 | Increase Per cent |
|---|---|---|---|
| Louisville | 234,891 | 223,928 | 4·9 |
| Covington | 57,121 | 53,270 | 7·2 |
| Lexington | 41,534 | 35,099 | 18·3 |
| Newport | 29,317 | 30,309 | −3·3 |
| Paducah | 24,735 | 22,760 | 8·7 |
| Owensboro | 21,055 | 16,011 | 31·5 |
| Ashland | 14,729 | 8,688 | 69·5 |
| Henderson | 12,169 | 11,452 | 6·3 |

*Education.*—The large number of illiterates reported in 1910 (208,084) led to the creation of two illiteracy commissions in 1914 and 1918 respectively. In Rowan county in 1911 night schools for adult illiterates were inaugurated. Renewed educational campaigns secured a compulsory attendance law, higher salaries, consolidated schools, better organization and more revenue, reducing illiteracy from 12·1% in 1910 to 8·4% in 1920. An Act of 1920 grants to counties and cities ample taxing powers to provide for their schools. The census reported 702,391 children of school age, of whom 519,093 were enrolled. High schools shared in this expansion, increasing from 83 in 1910 to 400 in 1920.

*Agriculture.*—The number of farms increased from 259,185 in 1910 to 270,626 in 1920, but the improved land decreased from 14,354,471 ac. to 13,975,746, despite the efforts of the reclamation

service, which expended $1,620,027 in the counties bordering on the great rivers and in the western coal area. This drainage and flood-prevention work involved 471,874 acres. No control has been perfected to meet floods, such as that of 1913. The number of farm owners increased from 170,332 in 1910 to 179,327 in 1920; the number of tenants decreased in the mining counties and increased in Mason 82%, Boyle 76%, Mercer 68%, Fayette 63%, and Bourbon and Jessamine 60% each. Women who operated farms in 1920 numbered 11,399; negro farmers, 12,628. The average size of farms decreased from 85·6 acres in 1910 to 79·9 in 1920. The value of all farm property rose from $773,797,880 in 1910 to $1,511,901,077 in 1920. The average value of farms in 1910, $2,452, rose to $4,823 in 1920; the average value of the land from $21.83 per acre to $48.62. Of the farms which in 1920 were operated by their owners, 25·8% were mortgaged.

Live-stock figures are not closely comparable because the census of 1910 was taken April 15, that of 1920 on Jan. 1. Despite this change, however, mules increased from 216,915 to 292,857, cattle from 898,444 to 1,093,453, and chickens from 8 to 10 millions. A decrease is recorded in horses from 425,000 to 382,000, though the price of thoroughbreds did not decline; in sheep from 778,154 to 707,845. The number of swine in 1920 was 1,504,431, valued at $15,471,514. The total value of all live stock in 1920 was $148,125,506.

The value of the crops in 1919 and 1909 was:

| | 1919 | 1909 |
|---|---|---|
| Cereals | $151,792,740 | $60,738,651 |
| Other grains and seeds | 1,660,745 | 765,903 |
| Hay and forage | 43,399,964 | 10,510,422 |
| Vegetables | 26,163,576 | 11,850,994 |
| Fruits and nuts | 4,989,367 | 5,019,231 |
| Tobacco | 117,730,675 | 37,174,000 |
| Miscellaneous | 2,917,857 | 4,535,607 |
| All crops | $348,654,924 | $130,594,808 |

After 1915 there was a marked increase in farmers' unions, marketing associations, young people's clubs and agricultural extension courses. On the other hand, orchards revealed a distinct decline both in trees and fruit, apparently suffering from neglect.

*Minerals.*—The coal output in 1910 was 14,623,319 tons; in 1916 it was over 25,000,000 and in 1920, 38,892,044 tons, the increase being partly due to strikes in other regions. To provide for this increase, most of which was in the eastern counties, the Louisville and Nashville Railroad constructed 333 m. of track and expended $30,000,000 during the decade of 1910–20; the Baltimore and Ohio constructed 55 m. In Pike, Perry, Letcher and Harlan counties the pop. increased 50% or more, while the number of tenants in the agricultural districts decreased. New towns, such as Ravenna, Jenkins, McRoberts and Lynch, sprang into existence. Petroleum was marketed in small quantities, because of the low prices, prior to 1916. Stimulated by the war, prices rose from $2.05 per bar. on Jan. 1 1917 to $4.50 at the close of 1920. No trustworthy figures are available prior to the reports of the tax commission, according to which 17 counties produced as follows:

| | No. of bar. produced | Value |
|---|---|---|
| 1918 (8 months April–Dec.) | 3,444,620 | $ 8,906,422 |
| 1919 (12 months) | 9,226,472 | 24,459,016 |
| 1920 (12 months) | 8,552,877 | 33,556,241 |

The greatest pool, Big Sinking, was opened in Lee county. A new field appeared in the south-western counties, centering about Allen and Warren. In many locations the drillers opened gas wells which have reduced the state's dependence on West Virginia's supply. Mt. Sterling, Winchester, Paris, Lexington, Frankfort and Louisville now obtain natural gas. The principal oil refinery is at Louisville. That city manufactured in 1919 various products to the value of $204,568,000 out of the state's total of $395,660,000.

From 1909 to 1919 capital invested in mines, quarries and wells rose from 26 to 201 millions, or 651%; value of products from 12 to 98 millions, or 713%.

*Communications.*—Railway facilities were, as already stated, enlarged to meet the increased coal production after 1910. Extension of existing pipe-lines provided for oil transportation, supplemented by river boats for which locks were built by the U.S. Government. But the largest expansion was in road-building and automobiles. Motor licenses increased from 2,808 in 1911 to 114,228 in 1920, bringing with them an insistent demand for better roads. To this end the state roads department receives a tax of $.01 per gal. on the sales of gasoline, and a tax of $.03 from state funds, with Federal aid for approved projects; it also shares with counties the cost of some inter-county roads.

*Finance.*—The old revenue system based on a general property tax proved inadequate to meet the cost of progressive legislation. After thorough investigation by a legislative committee in 1914, the Assembly at a special session in 1917 created a tax commission. The general tax was reduced from $.50 to $.40; the levy on bank deposits and live stock was fixed at $.10 per $100 of taxable property; a tax of 1% of the market value of oil goes to the state, and half as much to the producing county. Increased by license and franchise revenues, the general fund is then apportioned to various purposes by the Act of 1918. Under the new law, bank deposits rose from $11,000,000 in 1916 to $179,000,000 in 1917; assessed values from $922,000,000 in 1917 to $1,912,343,940 in 1921; railway valuations from $70,000,000 in 1914 to $160,000,000 in 1917. The total revenues in 1920 were $11,628,336. The need of a budget is shown by a floating debt which is carried in the form of warrants.

*Legislation.*—The Acts of the General Assembly for the period 1910–20 contain many provisions in regard to labour, education, and public health. The Child Labor Act of 1908 was improved in 1910, 1912, 1914 and 1916. Other progressive laws cover the subjects of tax reform, prisoners, banking, insurance, vital statistics and sanitation. In general the Assembly has welcomed all tenders of Federal coöperation in matters of agricultural extension, road-building and public health. No appropriations were made to meet the exigencies of the war beyond the Act of 1918 creating the Council of Defense at a cost of $50,000 per annum. An Act of 1920 to prevent the sale of worthless securities was due to the speculation in oil shares after 1916. A series of Acts permits all cities to adopt the commission plan of government.

*History.*—The great changes in the political and economic life of Kentucky during the decade 1910–20 were due to three factors: a programme of social legislation carried over from the previous decade; the World War; and participation in national reforms. Of secondary importance were two other factors: the exceptionally severe winter of 1917–8 which was accompanied by pandemic influenza; and the active road-building induced by the increased use of the motor-car. While disease and war tended to check the growth of population as well as to prevent construction work of all sorts, the demand for war supplies and the rise of prices distributed new wealth, created new towns in the eastern counties and permanently enriched all who could assimilate their prosperity. Toward the close of the decade the Prohibition Amendment destroyed the distilling industry, which stood first in value of output in 1914, amounting to $48,862,526; but tobacco alone at war prices in 1919 yielded the unprecedented sum of $117,730,675. Two Democratic governors were elected, J. B. McCreary (1911–5) and A. O. Stanley (1915–9). The latter, however, had a plurality of only 471 votes over E. P. Morrow, Republican, and a Republican was elected secretary of state. Governor Stanley resigned to take his seat as U.S. senator on May 19 1919, Lieut.-Gov. J. B. Black succeeding him. In Nov. 1919 Edwin P. Morrow, Republican, defeated Black by the surprising plurality of 40,176. While the state cast all her electoral votes for Woodrow Wilson in 1912 and 1916 and for Cox in 1920, she chose a Republican senator, R. P. Ernst, in 1920. Several changes were made in the state constitution by popular referendum: in 1915, to permit classification of property for taxation and to employ convicts on public roads; in 1917, to permit telephone companies to merge; in 1919, to adopt prohibition. The 120th county—McCreary—was organized in 1912 out of parts of Pulaski, Wayne and Whitley. In Nov. 1917 the U.S. Supreme Court declared void Louisville's race-segregation ordinance.

On April 3 1910 a night rider was convicted at Marion and in the same year certain farmers and residents of Grant county were convicted of violation of the Sherman Anti-Trust Act by conspiring to prevent the marketing of tobacco. In Aug. 1914 at Hartford, of 65 persons accused of "regulating conduct" by coercing their neighbours, 2 were sentenced; Jan. 11 1917 Governor Stanley persuaded a mob at Murray to disperse after threatening the judge and state's attorney for safeguarding a negro prisoner; and in the same year at Providence a miners' outbreak was quelled by guards returning from the Mexican border. On March 13 1921 a negro prisoner was lynched at Versailles, but the gaoler was removed from office. The most serious outbreak occurred Feb. 9 1920 when at Lexington a mob, attempting to enter the Fayette county court-house to seize a negro during the progress of his trial, was fired upon by state troops after repeated warnings. Seven men were killed and 22 wounded. Soldiers from Camp Taylor arrived later in the day, averting further bloodshed. The negro was convicted and sentenced a few minutes after the firing ceased.

Kentucky furnished for the World War 91,821 men in all branches of the army and navy. Of these, 3,015 died and more

than 4,000 were wounded, 300 remaining in hospitals in 1920. Camp Zachary Taylor at Louisville was one of the national cantonments for infantry, while artillerymen were trained at West Point in Jefferson county and at Camp Knox. Total subscriptions to the Liberty and Victory loans were $199,846,510.

(E. T.*)

**KENYA COLONY** (*see* 4.601).—The East Africa Protectorate, commonly known as British East Africa, was annexed to the British Crown in July 1920 and renamed Kenya Colony after Mt. Kenya, the most commanding natural feature of the country. The coast lands included in the protectorate which formed part of the Sultanate of Zanzibar were, however, not annexed; these became the Kenya Protectorate. The present article deals with the country as a whole after 1910, before and after the change in the form of government.

Census returns for 1911 gave the white pop. as 3,175 and the Asiatic (mainly British Indians) at 11,886. In 1920 the whites numbered about 5,570, Asiatics 17,427, Arabs (*i.e.* those long settled in E. Africa and not classed as Asiatics) about 8,000. The native pop. was estimated at 2,620,000. Mombasa, the chief seaport, had 32,000 inhabitants (350 Europeans); Nairobi, the capital, 15,274, of whom 2,020 were Europeans and about 5,000 Indians. The town has handsome public and private buildings, and nearly all the conveniences of a European city.

The period 1904–14 witnessed a great development in the highlands. The area suited to white colonization proved less than had been supposed and does not greatly exceed 12,000 sq. miles. Nearly all of this area had been alienated by 1921. In addition considerable areas along the sea-coast and adjoining Victoria Nyanza were developed by whites as "jungle" plantations, and a beginning made in exploiting the mineral deposits. Unlike the Baganda and other tribes of the Uganda Protectorate the natives produced comparatively little on their own account for export, except sim-sim, which is in demand for its oil, and is grown extensively by the natives of the Nyanza province. Somalis conduct a large trade in cattle. The white settlers in the highlands grow maize, wheat, barley, coffee, potatoes and other vegetables, fruits, flax, etc.; in the lowlands coco-nut, sisal, rubber, cotton and tobacco are the chief products. There are extensive grazing grounds in the highlands with large stocks of cattle and sheep. There are a few ostrich farms. By 1920 over 500,000 ac. had been granted for timber exploitation.

The Uganda railway was taxed to its greatest capacity to carry the rapid increase in goods. This growth of traffic was largely due to exports from the Uganda Protectorate and the north-west part of German East Africa. A branch line, 93 m. long, starting from the Uganda railway 282 m. from Mombasa (*i.e.* S. of Nairobi), was built in 1911–2 to the Magadi soda lake. Owned by the company which exploits the soda, it is worked by the Government. Another railway (30 m. long) was built from Nairobi to the Thika river (towards Mt. Kenya), opening up a rich highland region. In 1915–6, for military purposes, a railway was built from Voi (103 m. from Mombasa) via Taveta to Kahe, on the Usambara railway, German East Africa. But lack of adequate means of communication was a great hindrance to the opening up of the country.

Between 1909–10 and 1913–4 revenue increased from £503,000 to £1,123,000 and expenditure from £669,000 to £1,115,000. In 1912 the protectorate became self-supporting. Railway receipts, licences, taxes and customs are the chief sources of revenue.

The value of imports (excluding railway material, administration stores and specie) rose from £775,000 in 1909–10 to £2,147,000 in 1913–4. In the same period exports increased from £590,000 to £1,482,000. In the last-named year tonnage entering Mombasa and Kilindini harbours was 1,791,000. In the same year the net revenue from the customs reached £197,000, the highest recorded. Of the exports goods to the value of £443,000 were the produce of the protectorate; Uganda exported goods worth £564,000 and goods worth £448,000 reached Mombasa from German East Africa. The principal exports from the protectorate itself were hides and skins (£147,000), grain (£118,000), copra (£35,000), coffee (£18,000) and fibre (£16,000). Tobacco figured in that year (1913–4) for the first time in the exports. Over 60% of the trade was with the United Kingdom or India; the rest went chiefly to the United States, France and Germany. The German East African steamship line had however a large share in the shipping (over 600,000 tons in 1913–4) both to Europe and Bombay.

The World War rendered the trade returns of 1914–9 abnormal, imports largely increasing to meet the needs of the army and exports fluctuating greatly, while shipping dropped. More than half the white settlers joined the military forces and agriculture and stock-raising suffered in consequence. The revenue and trade figures for 1918–9 were: revenue, £1,548,000; expenditure, £1,570,000; imports, £3,397,000; exports, £2,498,000; tonnage, 455,000; customs receipts, £287,000. In 1919–20 a period of depression set in, and while expenditure was £2,170,000 revenue was only £1,726,000. In 1920–1 (year ending March 31) revenue and expenditure was estimated to balance at £3,192,000. The increase was nominal rather than real for the basis of calculation had been changed from rupees at 15 to the £ to florins at 10 to the £, the rupee being given the value of a florin (see below). Despite efforts at economy the year closed with a deficit of £166,000. From 1920 the Uganda railway surpluses which had up to then gone into the general revenue account were devoted to railway developments. In 1917 the customs departments of the protectorate and of Uganda were amalgamated.

*History.*—In July 1909 Sir Percy Girouard became governor in succession to Sir J. Hayes Sadler. The white community, then numbering some 3,000, was chafing under long delays in obtaining land grants and other grievances. Sir P. Girouard achieved the difficult task of working harmoniously with the settlers, who were largely recruited from the upper and middle classes of England, though they included some hundreds of Boer families. The settlers were mostly men of capital, and in 10 years after the first settler (Lord Delamere, the 3rd baron) had made the highlands his home that region was provided with churches, schools, hospitals, newspapers, substantial farm-houses and fenced farms and race and golf courses. The climate had been shown to suit the European constitution, though even at an altitude of 5,000 to 6,000 ft. manual labour under the Equator was not possible to many white men. The bulk of the farm work was done by the Kikuyu, a race with an aptitude for agriculture. Nevertheless much of the labour was of an indifferent character. Normally relations between the whites and the natives were satisfactory, but there were exceptions. In Sept. 1911 the indignation of the white community was roused by the deportation of Mr. Galbraith Cole, a pioneer settler, by order of the British colonial secretary. Mr. Cole, after vainly seeking protection from stock thieves, shot dead, while he was trying to escape, a Kikuyu caught sheep-stealing. Tried at Nairobi for murder the jury had acquitted Mr. Cole without leaving the box. One result of this episode was the taking of measures by the administration to afford the white settlers better protection, while the Kikuyu and other tribes were given reserves in which they were secure from interference by the settlers. The problem of obtaining adequate labour was serious, and an ordinance compelled the natives to give 60 days paid labour a year on public works. A circular issued in Oct. 1920 was so worded that it aroused the suspicion that the administration was favouring compulsory labour for private persons (*i.e.* the white farmers) and caused many protests in Great Britain. In July 1920 Lord Milner (then colonial secretary) made it clear that no such compulsion would be allowed. In general the good master had little difficulty in getting sufficient native help. In 1921 some 100,000 natives were working for Europeans.

In July 1912 the resignation was announced of Sir Percy Girouard, who had accepted an offer to join the engineering firm of Armstrong, Whitworth & Co. in England. Mr. (afterwards Sir) H. C. Belfield, the new governor, who had served 25 years in the Malay States, reached East Africa in Oct. 1912.

In June 1913 a missionary conference was held at the settlement of Kikuyu (some 15 m. from Nairobi) which was the subject of wide-spread and acute controversy. The missionary societies, as in many other parts of Africa, carried on the greater part of the work not only of Christianizing, but of civilizing the natives, giving them industrial as well as literary education. Their influence is great and nearly always beneficent. The Kikuyu conference was called to consider the matters of common interest to all Protestant missions. At the close of the conference the Bishop of Mombasa (Dr. W. G. Peel) officiated—in a Presbyterian church—at a communion service in which Anglicans, Wesleyans, Presbyterians, Congregationalists and others took part; a service not unusual in the mission field. But this service was strongly denounced by the Bishop of Zanzibar (Dr. Frank Weston), who sought to have Dr. Peel's action condemned. This the Archbishop of Canterbury (Dr. Randall Davidson) refused to do. The aim of the Church, he declared, was to create, out of the labours of all, a native African Church, not a part of the Church organization of England transplanted to Africa. The harmony among the various missionary bodies at

work in the country was not disturbed by this episode and the reports of the administration bore increasing testimony to the value of their labours. The missionaries found some of their strongest supporters among the white settlers.

The hostile attitude of the Merchan tribe in Jubaland compelled the Government to begin operations against them in Dec. 1913, and disturbances among the Turkana and other tribes in the frontier district adjoining Abyssinian Somaliland necessitated further operations. Thus when the World War began in Aug. 1914 nearly all the military forces of the protectorate—one battalion and two companies of the King's African Rifles—were in the region most distant from the frontier of German East Africa, and it was some weeks before they could be brought back to Mombasa. In the meantime the majority of the male settlers volunteered for active service, and from their ranks two regiments were formed. The story of the campaign which followed is told in the article EAST AFRICA.

It was not until March 1916 that the protectorate was finally freed from German incursions. The war proved very onerous for the natives, heavy demands being made on them for carriers, transport oxen and for meat supplies for the troops, while large numbers of them joined the combatant ranks. The natives responded remarkably well to the needs of the campaign and, despite an inevitable shortage in the white staff and a great loss of cattle through *rinderpest*, their loyalty was not shaken, and the administration continued on practically normal lines. The official report for 1917–8 described the work of the district officials, chiefs and native authorities as "worthy of the highest praise." Tribes on the Abyssinian border and in Jubaland continued however to give trouble. They had never been brought fully under control, and during 1915–6, despite the exigencies of the campaign against the Germans, further punitive measures had to be undertaken.

In 1917 Sir H. C. Belfield went on leave and later resigned, the administration being taken over by Mr. (afterwards Sir) C. C. Bowring, chief secretary to the Government. Changes in the administration, including an elected Legislative Council, were recommended by a committee of the existing nominated Council in June 1917, but no action was then taken. On Jan. 31 1919 Maj.-Gen. Sir Edward Northey took over the governorship. It was a period of change and strain, and Gen. Northey was called upon to deal with difficult political, racial and economic problems. A currency crisis was one of the effects of the war. The original currency was the Indian rupee, and since 1905 the £ sterling had been legal tender at 15 rupees. With the appreciation of silver during the war the exchange value of the rupee began to rise in 1917. The rise, at first gradual, was rapid in 1919 and early in 1920 had reached 2s. 9d. The result was to inflict hardship on the producing class, not only in Kenya, but in Uganda, which had the same currency. In an effort, ill considered, to rectify this state of affairs the Colonial Office in Feb. 1920 fixed the rate of exchange at 2s. sterling a rupee for Kenya, Uganda and Tanganyika Territoty. This interference with the course of the exchange prevented the producer from benefiting by the subsequent fall in the price of silver and the reversion of the rupee in 1921 in the open market to the value of 1s. 4d. or less, and in effect added 50% to his costs. The result on the industries of Kenya and Uganda was serious. The very marked decrease in trade in 1920–1 was not due wholly to this cause; the fall in value on the world's markets of tropical produce was a considerable factor, and many of the recent white settlers were without experience as farmers or planters. Sir Edward Northey strongly but unavailingly opposed the alteration in the exchange value of the rupee. In April 1920 a further change was made—a new coinage based on British currency was introduced, the unit being the florin at 2s. sterling, at which value the Indian rupee continued current until it could be replaced. In May 1921, "to prevent too abrupt fluctuations in local values," the Colonial Office decided to make the shilling and not the florin the standard coin. This appeared a reasonable change, as the labourer, clerk and petty trader had persisted in regarding the florin as of no more value than the rupee at the old rate of exchange.

Conditions in Kenya were further strained by the failure, as a whole, of a scheme launched in 1919 to establish ex-soldiers on the land. For this result the administration was partly responsible. Most of the settlers were allotted farms remote from the railway and in some cases undiscoverable, while the need for considerable capital had not been sufficiently made known.

During this period the change from a protectorate to a Crown colony was effected. In July 1919 an ordinance came into force establishing an elective element in the Legislative Council for Europeans, with two nominated members representing the Indian community and one nominated member representing the Arabs. A sufficient number of other nominated members was however retained to give the administration a majority in the Council. Eleven single member constituencies were created for the European electors. Adult franchise on a residential qualification was enacted. The first election was held in Feb. 1920. This was followed, in July 1920, by the formal annexation of the protectorate to the British Crown and the change of name to Kenya Colony. At the same time the raising of a large loan under the Colonial Securities Act was announced, the money to be spent chiefly on railway development, harbours and other public works. The building of a deep-water wharf at Kilindini so that goods could be loaded direct on to the Uganda railway was begun.

The discrimination against Indians made by the administration and in the new constitution caused acute controversy. The Indians outnumbered the whites by nearly three to one, and while the majority of them were mechanics, clerks, shop assistants, small traders or labourers there were many of higher class professional men and merchants with large interests in the country. The effect of the growth of national sentiment and the progress towards self-government in India was seen in East Africa, where associations were formed to protect Indian interests. These were held to be threatened by the withholding from Indians of "due and effective" representation on the Legislative and Municipal Councils, by the adoption of the principle of segregation of races and by the restriction placed on ownership of land by Indians. The Indians claimed full political and economic equality with Europeans. Neither claim was admitted either in theory or practice by the white settlers in Kenya, to whom the development of the country was predominantly due. The Europeans had the support of the local administration and of the Colonial Office in London, though the Colonial Office disavowed racial prejudice. Such prejudice existed in Kenya, as was seen in the report (published in 1919) of an official commission on the economic condition of the country. If this prejudice was not shared by the administration its position was, as stated by Sir Edward Northey in June 1919, that "though Indian interests should not be lost sight of, European interests must be paramount." Lord Milner (Colonial Secretary), in a despatch dated May 21 1920 to Sir E. Northey, laid down certain principles affecting Indians, including approval of the segregation policy and the reservation of the highlands (outside municipal limits) for Europeans. He proposed that the two Indian members of the Legislative Council should henceforth be elected on a special franchise, similar arrangements to be made for municipal elections. To these proposals the Indian community replied by reiterating their demand for equal rights, and they found powerful supporters in the Government of India and the India Office. The case for the Indians was put with much cogency in a despatch by the Government of India dated Oct. 21 1920. This despatch stated that in the opinion of the Government of India the true solution of the problem was "a common electoral roll and a common franchise on a reasonable property basis, plus an educational test without racial discrimination, for all British subjects"—a formula which would admit natives as well as Indians to the franchise:—

> Public opinion throughout India (the despatch added) regards the case of the Indians in East Africa as a test of the position of India in the British Empire. At the Imperial Conference of 1918, for the sake of Imperial unity, we accepted the reciprocity resolution, which practically excludes Indians from the self-governing dominions. We cannot agree to inequality of treatment in a Crown colony, especially in which India has always had a peculiar interest.

Further, objection was taken in the despatch to the application, as directed by the Colonial Office, of discrimination against Indians to the Uganda Protectorate, where Indians and Europeans had lived in full harmony. It was also pointed out that in the adjoining Tanganyika Territory, where Indians were protected by the Covenant of the League of Nations, Lord Milner's decision could not be applied (*see* TANGANYIKA TERRITORY). In June 1921 Mr. Winston Churchill, who had become Colonial Secretary, laid down as a principle for application to the Crown colonies and with special reference to Kenya, that there should be no barrier of race, colour or creed which should prevent any man, by merit, from filling any station for which he was fit.

In 1919 negotiations were opened with Italy for the transfer to Italian Somaliland of the right bank of the river Juba and of the port of Kismayu (*see* AFRICA: *History*).

Brown, *The South and East Africa Year Book and Guide*; T. J. O'Shea (editor), *Farming and Planting in B. E. Africa* (1917); G. D. Hale Carpenter, *A Naturalist on Lake Victoria* (1920); Guy Babault, *Chasses et recherches zoologiques en Afrique Oriental Anglaise* (1917); and *Voyage de M. Guy Babault . . . Résultats scientifiques* (1916–20). An annual report on the administration, etc., is published by the Colonial Office, London, and a special report by J. Parkinson on the geology and geography of the northern part of the country (Colonial Reports, Miscellaneous, No. 91) appeared in 1920. See also the reports on the Uganda railway (Nairobi, yearly) and the British Parliamentary Paper, "Correspondence regarding the position of Indians in East Africa" (1921).

(F. R. C.)

**KENYON, SIR FREDERIC GEORGE** (1863– ), English classical scholar and librarian, was born in London Jan. 15 1863, the son of John Kenyon, Vinerian professor of law at Oxford. He was educated at Winchester and New College, Oxford, and in 1888 was elected to a fellowship at Magdalen College. In 1889 he became an assistant in the British Museum, and in 1898 was chosen assistant keeper of MSS. there, being in 1909 appointed director and principal librarian of the Museum. In 1912 he was created K.C.B., and in 1913 was president of the Classical Association. During the World War he served with the army (1914–9), and in 1918 became adviser to the Imperial War Graves Commission. In 1917 he became president of the British Academy, in 1918 professor of ancient history in the Royal Academy, and in 1919 president of the Society for Hellenic Studies.

His published works include editions of Aristotle's *Constitution of Athens* (1891, 1904, 1920) with translations of the same (1891, 1920); *Classical Texts from Papyri in the British Museum* (1891); *Catalogue of Greek Papyri in the British Museum* (1893, 1898, 1907); *Our Bible and the Ancient Manuscripts* (1895); *Palaeography of Greek Papyri* (1899); and *Handbook to the Textual Criticism of the New Testament* (1901, new ed. 1912). He has also produced various editions of the works of the Brownings, including the *Letters* (1897) and *Poems* (1897) of Elizabeth Barrett Browning. He was editor of the centenary edition of Robert Browning's works (1912) and produced in 1914 *New Poems* of Robert and Elizabeth Barrett Browning. In 1914 he published an account of the buildings of the British Museum.

**KEOGH, SIR ALFRED** (1857– ), British physician and surgeon, was born in Dublin July 3 1857, and was educated at Guy's hospital and Queen's University, where he took his degree in 1878. In 1880 he entered the R.A.M.C. He served throughout the South African War. He was director of the R.A.M.C. from 1904 to 1910, and again throughout the World War,—his work in this capacity during 1914–8 proving him to be a most efficient administrator. He was made a K.C.B. in 1906, G.C.B. in 1917 and G.C.V.O. in 1918.

**KER, WILLIAM PATON** (1855– ), British man of letters, was born at Glasgow Aug. 30 1855. Educated at Glasgow University and Balliol College, Oxford, he became professor of English literature and history at Cardiff in 1883 and professor of English literature at University College, London, in 1889. In 1920 he was elected professor of poetry at Oxford. He made a special study of mediaeval literature, and amongst his publications are *Epic and Romance* (1897); *The Dark Ages* (1904); *Essays on Mediaeval Literature* (1905); *Sturla the Historian* (1907). An inspiring teacher, his pupils included many of the ablest *littérateurs* of the younger generation.

**KÉRATRY, (COMTE) ÉMILE DE** (1832–1904), French author and politician (*see* 15.753), died in Paris April 7 1904.

**KERENSKY, ALEXANDER FEODOROVICH** (1881– ), Russian politician, was born in 1881, the son of the principal of a high school in Saratoff. He studied at the university of St. Petersburg, took part in students' disturbances there and was expelled, but was readmitted and eventually took his degree in law. He joined the St. Petersburg bar and practised for some years as a junior and as leader, often appearing in cases concerning abuses of the administration. When troubles broke out in Turkestan and were supported by military force, Kerensky went to the affected districts and published a scathing indictment of the policy of the Government in Central Asia. In 1912 he was elected to the Fourth Duma and joined the Group of Toil: he was in reality an adherent of the Social Revolutionary party, but as it was impossible in those days to enter the Duma under this flag he chose the Group of Toil in preference to the Social Democrats, whom he considered to be too pedantic and distant from the people. As a member of the Duma he attained a certain notoriety by impassioned speeches and appeals for root-and-branch reform, but he was never conspicuous for steady work or constructive statesmanship. When the first Revolutionary Government was formed people were astonished to hear that Kerensky had been nominated Minister of Justice. The explanation was that he served as a link between the new Government and the Soviet of Workmen and Soldiers. His career as member and head of the Provisional Government is described in the article RUSSIA. He may be said to have played in Russia to some extent the part played by Lamartine in the French Revolution of 1848.

**KIAMIL PASHA** (1833–1913), Turkish statesman, was born at Nikosia, Cyprus, in 1833 and studied at the military school at Alexandria. In early life he held various offices in Cyprus, and in 1876 was governor of the vilayet of Kosovo. Between 1878 and 1885 he was successively Minister of the Interior, Evkaf (pious foundations), Instruction, and Justice, and in the latter year was appointed Grand Vizier by 'Abdul Hamid, which post he held until 1891. In 1895 he again became Grand Vizier but, after a short period, was dismissed as a too ardent reformer and was made governor, first of Aleppo and then of Smyrna. In 1907 he was removed from Smyrna and banished to Rhodes. After the Turkish Revolution in 1908, he succeeded Said Pasha as the first Grand Vizier under the regime of the Committee of Union and Progress but, refusing to submit to its dictation, he resigned in 1909. He again became Grand Vizier in 1912, but was driven from office by the Young Turk *coup d'état*, and retired to Cyprus, where he died Nov. 14 1913.

**KIDD, BENJAMIN** (1858–1916), British sociologist, was born Sept. 9 1858. He entered the civil service, becoming a clerk in the Inland Revenue office. During 1898 he travelled extensively in the United States and Canada for the purpose of economic study, and in 1902 he visited S. Africa for the same reason. In 1904 he published *Social Evolution*, the work by which he is best known. It was widely read and was translated into most European languages as well as into Chinese. His later publications included *The Control of the Tropics* (1898) and *Principles of Western Civilization* (1902). He died at Croydon Oct. 2 1916.

**KIDERLEN-WÄCHTER, ALFRED VON** (1852–1912), German diplomatist, was born at Stallgast July 10 1852, and was the son of a banker, Robert Kiderlen, who had married Baroness Marie von Wächter. He fought as a volunteer in the Franco-German War (1870–1) and then studied at different universities, retaining throughout his subsequent career a good deal of the jovial (*burschikos*) manner of a German student. In 1879 he entered the German Foreign Office, where he was regarded as one of the most promising members of the small clique that gathered round the celebrated and much over-rated Herr von Holstein. After holding various diplomatic posts, among them that of Prussian minister to Hamburg, he was sent to Bucharest in 1900 and remained there for 10 years, when he was recalled to occupy the post of Foreign Secretary under the somewhat inexperienced Chancellor, Herr von Bethmann Hollweg. He was soon in the thick of the negotiations with France (1911) which arose over

the Agadir incident, and which, owing to the state of Kiderlen-Wächter's health, were partly conducted between him and the French ambassador, Jules Cambon, at the Bavarian spa of Kissingen. The mystery which Kiderlen-Wächter, with the complicity of his chief, Bethmann Hollweg, chose to maintain with regard to Germany's ultimate intentions in Morocco, was largely responsible for the crisis which arose between the Western Powers and Germany and which necessitated very plain speaking in the House of Commons by Sir Edward Grey (Nov. 27 1911), and had previously given occasion for a very firm declaration on the British attitude by Mr. Lloyd George, then Chancellor of the Exchequer, at the Mansion House (July 21 1911). French public opinion was, moreover, indignant at certain negotiations which were secretly carried on with Berlin by the French Prime Minister, M. Caillaux, behind the back of the French Minister for Foreign Affairs, de Selves. An agreement on the basis of a cession of territory in the French Congo in exchange for a German declaration of complete *désintéressement* in Morocco was nevertheless ultimately effected. Kiderlen-Wächter died at Stuttgart Dec. 30 1912. (G.S.)

**KIELMANSEGG, ERICH,** COUNT (1847– ), Austrian statesman, was born at Hanover on Feb. 13 1847, and emigrated in 1866, after the incorporation of Hanover in Prussia, to Austria, where he entered the service of the State in 1870. He became governor of Lower Austria (1889–95), carried through the union of Vienna with the suburbs (Greater Vienna), was Minister of the Interior (1895), Prime Minister (June 19–Sept. 29 1895), then again governor until 1911. He was, with the exception of the Chancellor Beust, the only Protestant minister of Austria.

**KIEPERT, RICHARD** (1846–1915), German cartographer, was born at Weimar Sept. 13 1846, the son of Heinrich Kiepert, also a noted cartographer. Richard pursued geographical and historical studies at Berlin and Heidelberg universities. In 1870 he travelled in Palestine and Asia Minor, returning to take part in the Franco-Prussian War. He received the Doctorate of Philosophy at Jena in 1874; from that year until 1878 he was engaged in the compilation of Richthofen's atlas of China, and from 1875 to 1887 he edited the geographical periodical *Globus*. He had to do with the preparation of maps from the data collected by many well-known German travellers, such as Rohlfs, Barth, Möllendorf and Lenz. In 1893 he published a *Deutscher Kolonialatlas*, and subsequently, among other works, a *Spezialkarte von Deutsch-Ostafrika* (*1: 300,000*), and numerous school maps, being associated with the map-publishing firm of Dietrich Reimer in Berlin for 25 years. After his father's death in 1898 he completed or brought up to date many of his maps, including such historical works as the *Formae Orbis Antiqui*. Perhaps his most important single work was the *Spezialkarte von Kleinasien* (Asia Minor), (*1:400,000*) (1902–8). He received the Ritter medal in 1908, and the honorary title of professor in 1913. He died in Berlin Aug. 4 1915.

**KING, LEONARD WILLIAM** (1869–1919), English archaeologist, was born in London Dec. 8 1869. Educated at Rugby and King's College, Cambridge, he obtained an appointment in the Egyptian and Assyrian department of the British Museum and conducted the Museum's excavations on the site of Nineveh. He also travelled widely in the Near East and collected rock inscriptions in Assyria, Persia and Kurdistan. He was for some years professor of Assyrian and Babylonian archaeology at King's College, London, and published a large number of works on these subjects, including *Babylonian Magic and Sorcery* (1896); *Cuneiform Texts in the British Museum* (1896–1909); *Babylonian Religion and Mythology* (1899) and many others. He died in London Aug. 20 1919.

**KINNEAR, ALEXANDER SMITH KINNEAR,** 1ST BARON (1833–1917), Scottish judge, was born at Edinburgh Nov. 3 1833. He was educated at Glasgow and Edinburgh universities, and was called to the Scottish bar in 1856. For some years he acted as a law reporter, but in 1878 he was chosen leading counsel in the Court of Session for the liquidators in the case arising out of the failure of the City of Glasgow Bank, and henceforward his rise was rapid. In 1881 he became a Q.C., and the same year was chosen dean of the Faculty of Advocates. In 1882 he was made a judge, with the courtesy title of Lord Kinnear, and in 1890 an appellate judge, retiring from the Court of Session in 1913, although he continued to sit in the House of Lords as a lord of appeal. Kinnear was raised to the peerage in 1897 in recognition of his services as chairman of the Scottish Universities Commission of 1889. He was also a member of the commission of 1904 for settling the question of the division of Scottish church property. He died at Edinburgh Dec. 20 1917.

**KIPLING, RUDYARD** (1865– ), British author (*see* 15.825), published (with C. R. L. Fletcher) a *History of England* (1911); *Songs from Books* (1913); and a play, *The Harbour Watch* (1913). After the outbreak of the World War, he wrote a number of descriptive studies of the forces, viz., *The New Armies in Training* (1914); *France at War* (1915); *Fringes of the Fleet* (1915); and *Sea Warfare* (1916), as well as a volume of short stories, *A Diversity of Creatures* (1917), and some small volumes of war poetry. In 1920 he published *Letters of Travel*, an account of various wanderings between 1892 and 1913.

**KIRK, SIR JOHN** (1832–1922), British explorer (*see* 15.829), died Jan. 15 1922.

**KITCHENER, HORATIO HERBERT KITCHENER, EARL** (1850–1916), British field-marshal (*see* 15.838). In the autumn of 1910 Lord Kitchener accepted a seat on the Committee of Imperial Defence, and he spent the following winter in the Sudan and E. Africa. In the summer of 1911 he commanded the troops in London during King George's coronation, and he was a few days later appointed British agent and consul-general in Egypt. This modest title concealed a position tantamount to that of supreme authority, and during his tenure of office he introduced many reforms designed to develop the resources of the country and to ameliorate the condition of its people, a task in which he had made great progress when in June 1914, immediately after an earldom had been conferred on him, he proceeded to England on his annual leave. Thus it came about that he was in England when war was declared against Germany. He was asked by Mr. Asquith to accept the Secretaryship of State for War, and he took up his new duties in Whitehall on Aug. 6, the day after mobilization.

In view of the circumstances under which he was assuming this post, Kitchener laboured under certain disadvantages, coming as he did to the War Office for the first time. There was no precedent for a great soldier occupying the position at a moment of supreme national emergency. He possessed no previous experience of the central administration of the army. He was not familiar with the various ramifications of the existing military organization. He had made no close study of strategical problems involved in a campaign in Belgium and north-eastern France, nor could he lay claim to intimate acquaintance with the martial resources of the various belligerents. Owing to a misapprehension of the scope of the contest on which the country was embarking, arrangements had moreover been made in advance under which the general staff at headquarters was being seriously depleted in the interests of the Expeditionary Force that was proceeding to the front. But on the other hand his countrymen trusted him and were roused to enthusiasm by the magic of his name, his Cabinet colleagues placed their confidence in him as they would have done in no other conceivable War Minister, and these factors more than compensated for the disabilities from which he suffered. For Kitchener realized from the very outset that the struggle was practically certain to be much more prolonged than those in authority anticipated, and that a far more strenuous effort than had been prepared for would have to be made by the British Empire if it was to conquer. His remark on reaching his office the first day, "There is no army," was scarcely an exaggeration; for the admirably trained and well-equipped Expeditionary Force stood for no more than an insignificant fraction of the numbers that must be placed in the field, whereas existing means of expansion were totally inadequate.

He perceived that entirely new forces composed of personnel enrolled for the duration of the war must be created, and he straightway issued a stirring appeal to the nation asking for

100,000 men. It was followed by analogous appeals at short intervals, and the response was wonderful. He has been criticised for not making greater use of the existing Territorial organization in the earlier days—the numbers at the front might conceivably have, within narrow limits, been increased more rapidly had he done so. But he was looking far ahead. Realizing that the war would last long enough for his daring and original plan to bear fruit, he was resolved to transform the United Kingdom into a great military Power while the struggle was actually in progress, and complete success eventually crowned his efforts. If clothing and equipping the swarms of new levies presented obstacles at first, the skilfully tapped textile wealth of the country overcame them within a short space of time. But armament from the outset presented a much more perplexing problem. Plants admitting of a vastly increased output did not exist and had to be created, while expenditure of ammunition in the field speedily proved to be far in excess of the estimates which European experts had made in peace-time. Although steps were taken at once to expand munitions manufacture on a great scale, months were bound to elapse before these could possibly produce satisfactory results, industrial troubles indeed aggravating the difficulty.

While this swelling of the national fighting resources constituted Kitchener's greatest and most urgent preoccupation, the Secretary of State for War was also closely concerned in the general disposition of the military forces, and in superintending the plans that were being adopted to achieve victory in the field. India and the colonies were practically drained of regular British troops so as to strengthen the Expeditionary Force. His relations with the French were from the start most cordial, and that the western front represented the vital theatre of war he never doubted; but he found difficulty in restraining the ardour for ventures in the Near East that was displayed by certain Cabinet colleagues who were impatient at the slow progress of the Allies in France and Flanders. He was, no doubt, largely responsible for committing the country to the Dardanelles operations; but in the first instance he agreed to them under the influence of non-professional Admiralty optimism, and a special interest in Egypt perhaps weakened his soldierly reluctance to dissipate fighting forces. As member of a Government whose objections had been over-ruled by French insistence, he was obliged to assent to Macedonian projects in the autumn of 1915. Unwarranted confidence entertained by his fellow countrymen—it was reflected by the attitude of the military authorities in pre-war days—tended however to make his position difficult. Victory had been expected within a few months, whereas a situation of stalemate succeeded the dramatic opening weeks of the conflict. The public as a whole, it is true, never lost their trust in Kitchener, but doubts made themselves heard in some quarters, and these found expression in scarcely veiled attacks upon him in connexion with the shell shortage from which the British armies suffered during the first half of 1915. They helped to focus attention upon an all-important subject, and to bring about the setting up of the Ministry of Munitions, which made such effective use of the foundations laid by Kitchener and his subordinates.

When in the late autumn of 1915 evacuation of the Gallipoli Peninsula was in contemplation he dreaded the effect which withdrawal might exert in the East, and he proceeded to the Aegean. But there he satisfied himself that no other course was admissible; his proposal to divert the forces that would be made available to Alexandretta was opposed by naval and military experts at home, whose view the Government accepted. He visited Salonika and Athens, where he saw King Constantine, and on his way home spent a few hours at Italian headquarters. Shortly after his reaching England, work in connexion with operations, previously kept largely in his own hands, was transferred to the chief of the general staff, and he thenceforward concerned himself almost entirely with administration. There were already 45 British infantry divisions, produced by voluntary enlistment, in the field on Jan. 1 1916; but some of them were short of training, and it was only after the death of the creator of the "new armies" that they proved their real worth. Amidst his multitudinous labours Lord Kitchener had accepted heavy responsibilities in 1915 in connexion with rearming the Tsar's forces, and it was now arranged that he should visit Russia to discuss matters on the spot. On June 5 1916 he sailed from Scapa Flow in H.M.S. "Hampshire." The cruiser struck a mine off the Orkneys, and the great War Minister and most of his staff were drowned.

One of the foremost figures of his time, Kitchener inspired multitudes to a singular extent by his personality. Although a soldier by profession, with victorious campaigns to his credit, his title to fame rests upon statesmanship even more than upon martial prowess. He proved a resolute, capable commander on the Nile, at Paardeberg, and during the later stages of the S. African contest. His recovery of the Sudan was a masterpiece of military organization. To him was it due that India in 1914 possessed nine divisions fit to take the field. But his most conspicuous services to his country are to be traced to his grasp of political conditions and to his comprehensive and prescient outlook over public affairs. In the S. African War other generals might have worn down the Boer guerillas as he did, none would have stood so firm for reconciliation as opposed to insistence upon unconditional surrender. His record while virtual ruler of Egypt for four years was worthy of the traditions laid down by Lord Cromer. The crowning triumph of his career—the creation of the "new armies" and the raising of the United Kingdom to the status of a great military Power within the period of a few months—resulted from his instinctive realization of the gravity of an emergency which others, better situated to form conclusions than he was, had failed to appreciate. Thanks to diplomatic gifts of no mean order, he handled delicate international problems with unfailing tact. An accomplished linguist, he understood Oriental susceptibilities and aspirations to an extent given to few. Never sparing himself, he exacted a high standard of application and efficiency from subordinates. He thus achieved far-reaching administrative successes both in peace and in war, and as War Minister in 1914–6 he not only enjoyed public confidence as no other man could have done, but paved the way for the ultimate victory. (C. E. C.)

**KLINGER, MAX** (1857–1920), German painter, etcher and sculptor (*see* 15.847), died July 6 1920.

**KLUCK, ALEXANDER VON** (1846– ), Prussian general, was born May 20 1846 at Münster in Westphalia. He took part in the campaigns of 1866 and 1870, and was twice wounded at the battle of Colombey-Neuilly. In 1906 he was promoted to the rank of general of infantry, and at the outbreak of the World War was *Generaloberst* and Inspector-General of the VIII. Army Inspection. He was placed in chief command of the I. Army of the West, which he led in the battles of Maubeuge and St. Quentin, and the advance upon the Marne. He claimed to have repelled the outflanking movement of the French in the battle of the Marne, but he was nevertheless compelled, in consequence of the faulty disposition of the German forces in the line of battle and the success of the Allied offensive, to withdraw his army before what he described as overwhelming odds to the Aisne positions. In March 1915 he was wounded while visiting the front trenches, and was placed on the retired list in Oct. 1916. He published *Führung und Taten der I. Armee* (1920).

**KNIGHTS OF COLUMBUS.**—The American order of Knights of Columbus is a fraternal beneficiary society of Roman Catholics, founded by Rev. Michael Joseph McGivney in New Haven, Conn., on Feb. 2 1882, and organized under a charter granted by the state of Connecticut (March 29 1882). Beginning with 11 members the society grew rapidly; branches or councils were established throughout the state, then in other states, and finally in adjacent countries. In 1921 there were 2,200 councils, with a membership of over 800,000, found in every state of the United States, in Alaska, Canada, Mexico, Cuba, the Canal Zone, and Panama. From its beginning the order maintained a system of insurance, in which originally all members were required to participate; but after 1893 non-insurance members were enrolled as associates. On Jan. 1 1919 there were 128,935 insured members of an average age of 35 years; the Mortuary Reserve and Death

Benefit funds amounted to $8,740,000. The society is not a "secret" one, and no oaths are administered. Much attention is given to educational work. A chair of American history was founded by the society at the Catholic University of America, Washington, D.C., and 50 scholarships endowed at the same institution. The Knights of Columbus endeavour to combat socialism and radicalism by public lectures and publications. Beginning with the Spanish-American War (1898) they engaged in humanitarian relief. When America entered the World War (1917) about $1,000,000 was at once raised among the members, and work was undertaken at the various training camps in the United States. Further public appeals were made, and in recognition of their excellent service $40,000,000 in all was raised for war relief work. In America 350 buildings were maintained in the camps, and recreation was provided for enlisted men. Similar service was undertaken overseas and 250 recreation centres established. Comforts were provided on board transports and at piers. After the Armistice the Knights established employment bureaus and assisted ex-service men in finding work.

**KNOX, PHILANDER CHASE** (1853–1921), American politician, was born at Brownsville, Pa., May 6 1853. He graduated from Mount Union College, Alliance, Ohio, in 1872; studied law in an office in Pittsburgh and was admitted to the bar in 1875. The following year he was appointed assistant U.S. attorney for the western district of Pennsylvania. In 1877 he opened an office in Pittsburgh and soon developed a lucrative practice. In 1901 he was appointed Attorney-General by President McKinley and was retained by President Roosevelt. He resigned in 1904, having been appointed to fill the unexpired term of Matthew S. Quay deceased, as senator for Pennsylvania and was reëlected to serve 1905–11. In 1909 he resigned from the Senate to enter the Cabinet of President Taft as Secretary of State, holding that office for four years. He was again returned to the Senate for 1917–23. While he was Attorney-General many important suits were instituted, notably those against the "Beef Trust" and the Northern Securities Co. As senator he was active in debates relating to the Panama Canal, favouring the lock type which was finally adopted. He was opposed to the Panama Canal Tolls Repeal Bill passed in 1914. In 1916 he attacked the administration's Mexican policy and disapproved of the Adamson Eight-Hour Law. In 1919 he desired to separate the League of Nations, which he opposed, from the Peace Treaty. In 1920 he offered a resolution declaring that war with Germany was at an end, which was adopted by both Senate and House, but later failed to pass over President Wilson's veto; but a similar joint resolution of Congress was approved by President Harding July 2 1921 and a formal treaty of peace with Germany signed Aug. 25. He was the author of numerous addresses on railroad rates and commerce. He died in Washington, D.C., Oct. 12 1921.

**KNOX-LITTLE, WILLIAM JOHN** (1839–1918), British divine, was born at Stewartstown, Co. Tyrone, Ireland, Dec. 1 1839. He was educated at Trinity College, Cambridge, where he took his degree in 1862, being ordained in 1863. From 1865 to 1870 he was assistant master at Sherborne school, but afterwards held various curacies and livings, attracting much attention as an eloquent preacher. He was made canon of Worcester in 1881, and in 1885 became rector of Hoar Cross, Staffs. During the South African War he acted as chaplain to the brigade of Guards, and was mentioned in despatches. He resigned his living in 1907, and died at Worcester Feb. 3 1918.

**KOLCHAK, VLADIMIR VASILIEVICH** (1875–1920), Russian admiral, was the son of an engineer. His father took part in the Crimean War, and was one of the defenders of the famous Malakhoff Hill. Kolchak spent his childhood at a factory where his father was employed. In 1888 he entered the naval college at St. Petersburg and finished his studies successfully in 1894. In 1900 an Arctic expedition was organized by the Academy of Sciences for the purpose of exploring the "Sannikov Land," to the north of the Siberian shore, the true position and even the existence of which was uncertain. Baron Toll, the leader of the expedition, invited Kolchak to come with him. At that time he was abroad with the battle fleet, in which he held the rank of lieutenant, but he joined the expedition and took part in its hardships. After many exciting adventures the non-existence of the "Sannikov Land" was proved. The expedition was then divided into two sections: one of them, under Baron Toll, undertook the exploration of the uninhabited Bennet Is.; no member of this expedition was ever seen again. The other party, which included Lieut. Kolchak, after waiting in vain for the return of their companions, sailed back for St. Petersburg in the autumn of 1903.

Kolchak insisted on the necessity of sending a new expedition for the recovery of Baron Toll and his companions. The Academy upheld this opinion, and a new small expedition under Kolchak was sent to Bennet Is. in Jan. 1904. It succeeded in finding the place of the last camp of Baron Toll and in discovering his journal, from which it was clear that the unfortunate explorers, being at the end of their food supplies, had tried to return to the continent and had undoubtedly perished in the Arctic Sea. Kolchak returned to Siberia, bringing with him rich collections accumulated by Baron Toll. In Irkutsk he learned the news of the Russo-Japanese War, and left immediately for Port Arthur. His gallant behaviour during the siege received recognition even from the enemy: after the capitulation of Port Arthur he was allowed to wear his sword with the Cross of St. George when all weapons were taken from other officers. On his return to St. Petersburg in 1905 Kolchak handed to the Academy a report on his Arctic expedition, which was fully approved, and he was presented with a gold medal. Subsequently Kolchak took a leading part in the campaign for the reorganization of the Russian Naval Department and the reconstruction of the Russian fleet. A new general staff of the navy was created and Kolchak was appointed the head of the organizing and statistical section. His report on the "Distribution of the Naval Forces" was used as a basis of the new naval programme.

At the beginning of the World War Kolchak had the rank of captain and was in command of a destroyer in the Baltic. He took part in the operations in the Gulf of Riga in Aug. 1915 which resulted in the complete failure of the German attempt to seize the Riga shore and secured for a long time the right wing of the Russian front. In the summer of 1916 he was appointed commander of the Black Sea Fleet, with the rank of rear-admiral. His activities in this command were most valuable. Even after the revolution the Black Sea Fleet remained for some time the only part of the Russian military force where order and discipline were maintained. But the rising wave of disorganization eventually prevailed here as elsewhere. Kolchak refused to recognise the dictatorship of the Council of Workmen, Sailors and Soldiers at Sevastopol, and when he was ordered to surrender to them his sword with the Cross of St. George, he threw it overboard and left the fleet.

After staying for some time in America, Kolchak returned to Russia, and took an active part in the fighting against the Bolshevists in Siberia. On Nov. 18 1917, by a decision of the Russian Government at Omsk, Adml. Kolchak elected to assume the supreme power instead of the Directorate, which was abolished. He became virtually dictator of Russia. The Council of Ministers remained unchanged under the leadership of Vologodsky. Kolchak assumed the title of Supreme Ruler of Russia, and declared officially that he would convoke a National Assembly, which must be convened as soon as normal conditions were restored, and which alone could have power to decide the future organization of Russia. But he refused to recognize the Constituent Assembly elected in 1917 under abnormal conditions as it did not represent the will of the nation. He proclaimed his sole aim to be the liberation of Russia from enslavement by the Bolshevists, and pledged himself to carry on the struggle to complete victory.

On Jan. 20 1918, at the first meeting of the revived Russian Senate, whose sitting at Petrograd had been suspended by the Bolshevists, Kolchak solemnly took the oath to obey the laws and to fulfil faithfully his trust as Supreme Ruler. The land policy of the new Government was modelled on democratic lines, in view of the advance of the army westward. Whoever sowed was entitled to the harvest, irrespective of the ownership of the land; every

encouragement was promised to peasant owners. A final agrarian settlement was reserved for the decision of the National Assembly. But the exceptionally difficult conditions in which the new Government was placed forced Kolchak to take other and less democratic measures. An order was published stating that any attempt to murder the Supreme Ruler, or to wrest power from him, would be punished with death; failure to execute his orders and decrees would be punished with deprivation of civil rights and penal servitude. Numerous arrests were made among political opponents, especially among the members of the Social Revolutionary party. A certain number of executions were ordered by the courts martial.

Kolchak was recognized as Supreme Ruler of Russia by the anti-Bolshevist army of Gen. Denikin in the south of Russia, by the Archangel Government, and, later, by the leader of the N.W. Russian army, Gen. Yudenich. The success of the Siberian offensive in the first half of 1919 had as a result the conditional recognition of Kolchak's Government by the Supreme Council in Paris, June 1919, as the *de facto* Government in Russia. In his declaration to the Allied Powers Kolchak recognized the Russian foreign debts, but refused to recognize the independence of Finland and of the Baltic States, considering that a final decision on these questions could only be taken by the National Assembly.

A peculiar feature of the situation in Siberia was the presence of foreign troops, which were under the command of the French Gen. Janin on the front, and under the orders of the British Gen. Knox in the rear, and thus were quite independent of the Supreme Ruler. In March 1919 the foreign effectives in Siberia numbered over 118,000 men, as follows: Czechoslovaks, 55,000; Poles, 12,000; Serbians, 4,000; Rumanians, 4,000; Italians, 2,000; British, 1,600; French, 760; Japanese, 28,000; Americans, 7,500; Canadians, 4,000. These forces were, however, mostly employed in guarding communications. As for the Czechoslovaks, they were not in sympathy with Kolchak's Government and their chief object was to go home. The Russian army of Kolchak was at the same period estimated at about 150,000 men; this number increased considerably later, but the greater part of this army was composed of raw recruits. When Kolchak assumed the supreme power, the Ural front was held by the Czechoslovaks, but a few weeks later they were relieved by the new Russian army, in the organization of which Kolchak took a leading part as War Minister of the late Government. An offensive was ordered in the middle of Dec. and proved a considerable success. In a great advance of the right wing of the Siberian army the Bolshevist troops suffered a heavy defeat. The town of Perm was occupied on Dec. 24, and more than 18,000 prisoners fell into the hands of Kolchak's troops. Ufa was captured on Dec. 31, and the victorious Siberian army crossed the Kama river and pursued the retreating enemy towards Glazov, taking another 30,000 prisoners. The unfavourable conditions of the Siberian winter, however, and the necessity of completing the organization of the army, did not allow Kolchak to develop his offensive at that moment, but the situation on that front remained fairly satisfactory during the whole spring. On the other hand, the Bolshevists had an important success on the southern front, occupying Orenburg with control of the Turkestan railway.

The great offensive of the Siberian army started in March, when the weather became less unfavourable. For more than two months the young Russian army was advancing on a broad front towards Moscow, which was to be the final objective. Orenburg and Ekaterinburg were occupied in April, and in May Kolchak's troops reached the river Viatka on the Kazan–Sarapul railway line, moving towards Kazan from E. and S.E. Only a few dozen miles separated them from that city and the Volga river. The great advance on the northern section of the front seemed to favour the daring plan of a junction with the Archangel troops. But the great effort of these months had exhausted the power of the Siberian army. Lack of munitions and food supplies, bad communications, lack of true discipline, which could not be created in a few weeks, the absence of efficient administration, continuous misunderstanding between the Government and the Allied Missions which disposed of the munitions and food supply, internal troubles and quarrels among the leaders of different political parties, Bolshevist propaganda, and, most important of all, lack of staunch support from the mass of the population—all these conditions broke down the vigorous advance of the army; it was even unable to resist the Bolshevist counter-offensive. The Moscow Government sent new troops to the eastern front and launched an attack in the direction of Ufa. In the beginning the Siberian army defended the line gallantly, but after a few weeks of constant fighting Kolchak's troops were obliged to retire, and Ufa was captured by the Reds on June 9. The success of the Bolshevists grew rapidly. On July 1 they occupied Perm, and a fortnight later entered the town of Ekaterinburg. Nothing could stop now the retreat of Kolchak's army; demoralization was growing every day. The Ural was crossed in Aug., and in the beginning of Sept. the Bolshevists captured Tobolsk in Siberia and the town of Orsk in the Orenburg district. This disastrous retreat could not remain without influence on the Russian policy of the Allies. On Sept. 15 the Supreme Council in Paris unanimously agreed to follow the British policy of evacuation from Russia and expressed itself as absolutely opposed to any "Russian adventures." The news from abroad certainly did not strengthen the resistance of the Russian army. A last military effort was made in Sept. in the region of Tobol river, and the army had a temporary and local success on this sector of the front, but this diversion was not important enough to stop the advancing Reds. Omsk, the capital of the Siberian Government, was captured by them on Nov. 15; 10 generals, 100 officers, 80 locomotives, 3,000 waggons, etc., fell into their hands.

The seat of the Siberian Government had been transferred to Irkutsk. The leaders of the opposition, especially the members of Socialist parties, took the opportunity of the disaster on the front to renew their activities. A rebellion against Kolchak's Government took place in Vladivostok, and the rebels were joined by Gen. Gaida, the former chief of the Czechoslovaks in Siberia; the movement was suppressed by military force, and Gen. Gaida had to leave the country. Similar riots on a smaller scale were reported from Irkutsk and other places. Under the pressure of the growing hostility of the population Kolchak made a last attempt to reorganize the Government. Victor Pepeliaev, a former teacher and member of the Russian State Duma, was appointed prime minister. He tried to save the situation, basing the policy of his Government on the principle of local autonomy, which was advocated and supported by Gen. Diterichs, formerly chief commander of the troops, and Gen. Semenov, the Cossack leader. But no change of governmental policy could stop the course of the disintegration. The Reds took Novo-Nicholaievsk on Dec. 14, and were moving towards Irkutsk without meeting any resistance as the Siberian army was practically dissolved at that time. The socialist Zemstvo and municipal council of Irkutsk took energetic steps to overthrow the Central Government. The rising resulted in the creation of a new socialist Government, which was elected at the end of Dec. at a joint meeting of the Irkutsk Zemstvo and municipality. Kolchak was asked to resign; at first he refused, but on Jan. 4 he signed an ukaz transferring his power to Gen. Denikin and the supreme military authority in Siberia to Gen. Semenov. At the same time he asked for the protection of the Allies and this was promised to him. But when Kolchak, under the guard of Czechoslovaks, was passing through Irkutsk in his train, which was also loaded with a considerable part of the £65,000,000 gold reserve, the new Irkutsk Government demanded his surrender, threatening in the case of non-acceptance to resist the free passage of the Allied Missions. Gen. Janin ordered the surrender of Kolchak and Pepeliaev. They were kept prisoners for some time at Nijni-Udinsk, and were shot by the Bolshevists on Feb. 6 1920.

(P. VI.)

**KOMURA, JUTARO,** MARQUESS (1855–1911), Japanese statesman (*see* 15.892), was Foreign Minister in the second Katsura administration (1908–11) and died Nov. 24 1911.

**KORBAY, FRANCIS** (1846–1913), Hungarian musician, was born at Budapest in 1846. He was a godson of Liszt, of whose music he became a well-known interpreter. He had many

successful European tours, and was also extremely popular in England. Korbay wrote many pianoforte pieces and songs, but he is best known by his collections of Magyar folk-songs, which have attained a very wide popularity. He died in London, which for many years was his home, March 9 1913.

**KÖRBER, ERNST,** RITTER VON (1860–1919), Austrian statesman, was born at Trent on Nov. 6 1860, the son of an officer. He entered the State service in 1872, became Minister of Commerce (Nov. 30 1897–March 5 1898); Minister of the Interior (Oct. 2–Dec. 21 1899); Prime Minister (Jan. 18 1900–Dec. 31 1904 and Oct. 28–Dec. 20 1916); deputy curator of the Academy of Sciences (1904–19).

Körber represented the old Austrian tradition of faithful public service; his aim being to ward off by a comprehensive scheme of administrative reform the obvious crumbling of the old system of centralized Government. His *Studies* in administrative reform, published in 1904, involved an indictment of the administration unheard of hitherto in Austrian official circles; he wanted to do away with the "notorious double-tracking" of the parallel administration of the central State and its units, to make a sharp distinction between their respective competence, and to establish a sort of clearing-house of the mixed jurisdictions, leaving intact the whole of the rights of both the State and the unit. This great work remained unachieved, because none of the separate nationalities was prepared to make the necessary sacrifice, even in return for compensation. He tried, with "passionless perseverance," to set Parliament functioning again, seeking to win support by granting large State credits for Alpine railways and Galician waterways; but his success was short-lived, and the delays in the execution of the canalization schemes, which were increasingly costly as time went on, even led to special obstruction on the part of the Poles. The concessions which he made to each national group led to corruption (the purchase of votes by concessions, parliamentary "milking"). After the murder of Stürgkh, Francis Joseph summoned him to the rescue of the State (Oct. 1916), but on the old Emperor's death the new monarch quickly got rid of his unaccommodating adviser. He died in Vienna, March 6 1919.

**KOREA** (CHOSEN).—On Aug. 22 1910 Korea (*see* 15.908) became an integral part of the Japanese Empire, under its ancient name of *Chosen*, formerly in use for over five centuries and now officially restored: with this event, a new era dawned for what was formerly the "Hermit Kingdom." The ordered and systematic progress, already inaugurated by Japan in 1906, advanced steadily, though attacks were still made by some foreign critics on her suppression of Korean nationalism.

The peninsula of Chosen, with its outlying islands, has an area of 85,229 sq. m. of which 82,926 sq. m. form the mainland. It is thus about as large as the mainland of Japan or about two-thirds of the size of the British Isles. The pop. in 1920 was 17,284,207, including about 337,000 Japanese and about 23,000 foreigners. The density is only about 208 inhabitants per sq. m. compared with 376 in Japan and about 374 in Great Britain. The climate is dry and bracing, without intense variations of cold and heat, and, in contrast to Japan, there is an absence of hurricanes and practically no visitation of earthquakes. The country is mountainous, especially in the N., but there are extensive plains, well-watered with good rivers, on the S. and W. where are situated the excellent harbours of Fusan, Mokpo, Chemulpo and Chinnampo. The mineral wealth of the country is concentrated in the N., while agriculture is the predominant characteristic of the level and fertile south-west. Chosen's geographical position affords her easy access to the markets of China, Manchuria and Siberia, and a railway line now connects her with northern Asia and thus to the heart of Europe.

*Administration.*—Subsequently to the annexation, the functions of the Japanese residency-general and of the Korean Government were merged in those of a governor-general, the first to be appointed being Gen. Terauchi, with Mr. I. Yamagata, son of Prince Yamagata, as administrative superintendent. In Oct. 1916 Gen. Terauchi vacated his post to become Premier of Japan and was succeeded by Gen. Count Hasegawa, Mr. Yamagata continuing in office. An important reform effected in this period was the unification of the police and the *gendarmerie* services, by which a better control of the outlying districts was obtained, where hitherto the peace and security of the inhabitants had been frequently disturbed by bands of robbers and marauders. The serenity of Chosen, which had remained unclouded since the annexation, was broken up somewhat abruptly by widespread disturbances which took place in March 1919. Owing to a spirit of unrest, partly due to the World War, partly due to agitators and, no doubt, partly engendered by the cautious slowness of the Japanese in introducing administrative reforms suitable to the measure of progress already achieved, the Koreans were submerged in a wave of desire to achieve at one step that measure of "self-determination" which President Wilson's utterances appeared to them to justify. The disturbances, however, were quickly subdued and the Japanese Government hastened forward reform measures which had already been contemplated. The heads of the administration resigned and Baron Saito was appointed governor-general and Dr. R. Midzuno administrative superintendent. The reforms introduced were: (1) the extension to civil officials of eligibility to the post of governor-general, hitherto only open to a military officer of the rank of general; (2) the governor-general, formerly only directly responsible to the Throne, to be amenable to the Prime Minister of Japan; (3) the governor-general to be relieved, even when a military officer, of the right to the military command, which should be exercised only by the commander of the army; (4) the substitution of a police force for the mixed system of *gendarmerie* and police.

The premier, Mr. Hara, also issued a statement that the Government were desirous of further eliminating as time went on, all differences between Japan proper and Chosen in matters of education, industry and the civil service. A system of provincial and municipal administration, similar to that in Japan, would also gradually be evolved.

Peace was thus established and the Koreans again settled down, although various agitators and malcontents who had fled either to Shanghai, or to Manchuria, from time to time made abortive attempts again to stir up the feelings of discontent which had been so successfully allayed. Episodes which occurred in the autumn of 1920 in the Chientao district, when a Japanese consulate was burned, and attacks were made on peaceful Japanese and other civilians, were subsequently found to have been engineered by Korean agitators.

*Finance.*—After the Russo-Japanese War, 1904–5, Japan turned her attention more actively to the reform of Chosen fiscal affairs, hitherto sadly neglected, as the budgetary laws enacted in 1895 were not adhered to in practice. Detailed regulations regarding revenue and expenditure were promulgated in June 1906, the system of public tenders was introduced and a Bureau of Audit was established. The Seoul branch of a Japanese joint-stock bank was authorized to act as the Central Treasury of the Chosen Government and the post-offices were also entrusted with Treasury business. In Sept. 1906 regulations with regard to the collection of taxes were issued and assessors appointed, all being made directly responsible to the Minister of Finance.

The coinage system of Chosen was a matter urgently in need of reform, as not only was there no standard money and an excess of nickel coins, but a great deal of spurious foreign coin was also in circulation. A law of 1901, not then put into force, by which the coinage system was to be made analogous to that of Japan, was therefore revived and became operative in June 1905, and it was further provided that the standard money of Japan, or bank-notes, should become the standard money of Chosen. Thus Chosen became a gold country and in a few years' time the country reaped an enormous benefit, both at home and abroad.

The ordinary revenue rose from 44,764,559 yen in 1916–7 to 69,347,820 yen in 1920–1; while the extraordinary revenue rose from 23,437,548 yen in 1916–7 to 54,462,123 yen in 1920–1. The total expenditure which in 1916–7 was 57,562,710 yen, was in 1920–1 113,328,334 yen.

*Foreign Trade.*—The external trade of Chosen, rapidly increased during the decade 1910–20, is chiefly owing to the development of her agriculture and industry. Contributing factors have been the improvements effected in transport, both by sea and land, with a consequent lowering of freights, the revision of the customs tariff, and also to the greater demand created by the World War.

Exports, valued at 15,369,009 yen in 1912 (in addition to exports to Japan itself of 5,616,608 yen), increased to 199,848,854 yen in 1919 (with 19,816,927 yen to Japan itself); and imports, 40,756,013 yen in 1912 (plus 26,359,434 from Japan), rose to 184,917,978 yen in 1919 (plus 95,868,640 yen from Japan).

During the same period the ratio of the total foreign trade with that of trade with Japan and other countries may be seen from the figures given in the following table:

| | Trade with Japan | Trade with foreign countries |
|---|---|---|
| 1912 | 67% | 33% |
| 1913 | 68% | 32% |
| 1914 | 72% | 28% |
| 1915 | 78% | 22% |
| 1916 | 75% | 25% |
| 1917 | 75% | 25% |
| 1918 | 81% | 19% |
| 1919 | 77% | 23% |

*Agriculture and Industry.*—In 1908 a special Government office was established in order to control and foster the cultivation of the medicinal plant ginseng, an unrivalled quality of which is produced in the peninsula. Experiments were conducted to counteract disease in the crop and to improve the methods of cultivation, associations of cultivators being also formed. The area under cultivation increased fifteenfold from 1908 to 1920, the present annual value of the medicinal ginseng raised being 2,000,000 yen.

In 1907 the Government commenced operations for the natural evaporation of salt, a product hitherto obtained by the artificial boiling process, and the results being satisfactory, the manufacture was developed as a Government enterprise. By 1918, salt-pans covering an area of 2,528 ac. were in operation, producing 102,396,141 lb. of salt. As this quantity is still insufficient for home consumption, in 1920 the Government commenced laying out an additional 6,370 ac., the work to be completed in seven years.

The production of tobacco, an old-established industry in Chosen, has been greatly improved, both as regards cultivation and manufacture, by the encouragement received from the Government. The area under cultivation has increased from 33,261 ac. in 1915 to 42,525 ac. in 1919, the total value having risen from 4,878,127 yen to 14,501,169 yen in the same period.

*Sericulture.*—The dryness of the Chosen climate being very favourable to the cultivation of the mulberry tree and the rearing of silkworms, sericulture had been long established, though it had developed but slowly. When the Government undertook the reorganization of the industry in 1906 a great improvement was effected. The native silk-worms being found to be inferior to the Japanese species, the latter were gradually introduced and the production of cocoons was greatly augmented thereby. Some 400,000 families are engaged in the industry, nearly 60,000 ac. of mulberry trees are under cultivation and, in 1918, over 600,000 bus. of cocoons (against 69,000 in 1910) were produced, whilst the value of the cocoons exported in 1918 was nearly 5,000,000 yen. The export of silk itself is negligible, the silk industry of Chosen being still in its infancy.

*Stock-Farming.*—Cattle-breeding is carried on nearly everywhere in the peninsula, the bulls being employed largely for agricultural and draught purposes on account of their hardy constitution and massive build. The cows give little milk, but furnish good beef. Cow-hides occupy an important place in the export trade. A decline of export was shown in 1912 and 1913 due to cattle plague on the frontier districts, and the large increases in hide exports in 1915 and 1916 were due to the war demand in Japan for tanning purposes.

The Chosen horses are poor but experiments in improving the breed are being conducted by the Government: the breeding of asses, mules, sheep, pigs and goats is proceeding and poultry-raising is also being encouraged.

*Horticulture.*—Fruit-farming received considerable impetus through the establishment of model agricultural farms by the Government. Generally speaking, the number of pear, apple and chestnut trees and also of grape vines has doubled in the years 1913 to 1918. Afforestation has progressed uninterruptedly since 1907 when the Government first undertook a share of this necessary work, which is also actively carried on by private enterprise. By 1918 the Government had planted 13,004 trees covering 7,880 ac., the local administration 8,194 trees on 17,738 ac., whilst private enterprise had taken up, under lease, 240,443 ac. of State forest-land.

*Mining.*—Prior to the annexation, the mining industry of Chosen was chiefly in the hands of foreigners, four American corporations and four individuals holding rights, two English corporations and one individual, two Frenchmen, one Russian and one Italian, besides several Japanese and Americans jointly, all enjoying mining privileges and exploiting some 270,000 ac. of mining area, principally gold-bearing. A mining law enacted after the annexation and made operative on April 1 1916, prohibited foreigners from acquiring mining rights in Chosen, unless as a legal Japanese corporation, although the rights existing and already granted to foreigners by the former Korean Government were strictly respected.

The principal mineral products, in addition to gold, are silver, zinc, copper, lead, iron, tungsten ore, graphite, coal (especially anthracite), quartz sand and kaolin. A number of Japanese mine-owners have recently commenced operations in the peninsula and the mining enterprise shows a steady expansion. The total yield from all the mines in the country was as follows:—

| | | | |
|---|---|---|---|
| 1910 | 6,067,952 yen | 1916 | 14,078,188 yen |
| 1912 | 6,815,121 " | 1918 | 30,838,074 " |
| 1914 | 8,522,418 " | 1919 | 25,414,510 " |

*Manufactures.*—Strictly speaking, the factory system of Chosen is still in the first stages of development, the native handicrafts of weaving, ceramics, metal-casting, etc., having been much neglected. New industries, however, are now growing up. The principal ones are ore-smelting, pulp manufacture, cotton-spinning, rice-cleaning, brewing, the production of gas and electric current, as well as the ginseng, tobacco and salt industries already mentioned.

Iron works have been founded at Kyumipo, in the Hwanghai province, which it is estimated will produce annually 100,000 tons of pig iron, 62,000 tons of iron ingots, and 73,000 tons of iron plates, bars, etc., besides by-products. In Shin Wiju a large factory has been established for pulp-making for which the native Yalu timber is being employed. A tanning factory at Yung-dung-po is producing leather belting, sole-leather, harness leather, etc., by the process of oak-chrome tanning.

In 1917 there were in all 1,358 factories in Chosen, with a capital of 39,038,966 yen, the year's production having a value of nearly 100 million yen. About 85% of the capital was provided from Japanese sources, but there are signs that the natives are awakening to a new interest in manufacturing enterprise.

*Fisheries.*—Since 1911 the Chosen fisheries have been much improved owing to the provisions of the Fishery Law, promulgated in that year. New fishing associations have been formed, havens for the fishing fleet provided, and proper investigations conducted into the suitability of gear and the movements and location of fish. As a result the fishing population has increased from 93,400 with 16,709 boats in 1910, to 346,349 with 53,118 boats in 1918, the total value of the catch having risen from 7,871,910 yen to 32,863,402 yen in the same period.

*Communications.*—Prior to the establishment of the protectorate, Chosen possessed no highways worthy of the name, such roads as existed having been allowed to lapse into a shocking state of repair. Few roads were wide enough for vehicular traffic and many were only six feet broad, besides being extremely rough and difficult for coolies and horses alike. After the commencement of the protectorate régime, the Government engineering department planned an extensive scheme of highway construction and by Mar. 1918 over 5,000 m. of road had been constructed or repaired. Some 3,850 m. were undertaken at Government expense and the cost of the remainder was shared between the Government and the local authorities, the total outlay being about 25,000,000 yen.

The first railway line in Chosen, between Seoul and Chemulpo, was completed by a Japanese syndicate in 1900 and opened to traffic in Oct. of that year, whilst the same syndicate undertook the construction of the Seoul–Fusan railway (274 m.), which was completed and opened to traffic in Jan. 1905. The trunk line Seoul-Wiju (309 m.), which traverses the peninsula lengthwise, was built by the Japanese army and completed in 1906. Branch lines were added from time to time, so that by the time Chosen became part of the empire, some 759 m. of railway were in operation. By 1919–20 this figure had been increased to 1,153 miles.

*Posts, etc.*—Since 1910 the expansion of the postal, telegraph and telephone services in Chosen has been normal, the number of post-offices having increased from 447 in 1910 to 562 in 1920, the postal packets from 100,265,041 to 267,635,965 and the parcels from 1,589,722 to 4,230,179. The length of telegraph lines increased in the same period from 3,389 m. to 4,870 m.; the length of wires from 7,740 to 16,063 m.; and the number of messages from 7,127,235 to 11,012,075. The length of telephone lines increased from 314 m. to 3,260 m.; the wires from 10,121 m. to 225,016 m.; and the messages from 21,260,918 to 58,691,425.

A great increase both in the number of depositors and the amount of their savings was a feature of the Post-Office Savings Bank in Chosen; in 1911–2 there were 223,599 depositors (4,365,996 yen), and in 1919–20 there were 1,406,259 depositors (14,925,990 yen).

(H. SA.)

**KORNILOV, LAVR GEORGIEVICH** (1870–1918), Russian general and patriot, born on Aug. 31 1870 in the little town of Ust-Kamenogorodsk, Siberia, was essentially a son of the people, his father being a poor Cossack officer and his mother also a Cossack. As a boy he went through a severe schooling in a life of want and privation. At nine years old he entered the parish school, where somehow he learnt to read and write. He prepared himself unaided for his entrance into the Siberian Cadet Corps, which he joined in 1883. Passing thence to the Michailovsky artillery school in St. Petersburg, he was in 1892 commissioned and posted to the Turkestan Artillery Brigade. Within three years he was back again at the capital to enter the academy of the general staff, in the final examinations of which, in 1898, he was among the first. Not attracted, however, by life in the big civilized centres, and instinctively drawn to the open spaces of the Russian borderlands, Kornilov again devoted himself to service in Turkestan, whence he undertook a series of daring journeys into Afghanistan, Chinese Turkestan, Persia and Baluchistan. In 1904, on the outbreak of the Russo-Japanese War, Kornilov, then a lieutenant-colonel, received an appoint-

ment with the field army. As a staff officer he took part in many engagements, and for gallant conduct in a difficult rear-guard action at the battle of Mukden he was decorated with the order of St. George of the fourth class. Subsequently he served in the headquarters offices of the general staff and spent four years (1907–11) as Russian military attaché in Pekin, during which period he made journeys into the interior of China.

In the opening stage of the World War, during the Russian campaign of 1914–5 in Galicia, Gen. Kornilov commanded the 48th Inf. Div., which, under his leadership, performed many daring exploits as part of Brussilov's VIII. Army. In the great battle of May 1915 this division became isolated in the Carpathians, and was only extricated by the self-sacrifice of its rear-guard, which Kornilov personally led. He himself was wounded and taken prisoner. He was sent to the fortress of Laka, in Hungary, but, having learnt the Czech language, he managed to escape, dressed as an Austrian private, with the help of a Czech medical officer. They made for the Rumanian frontier on foot, but on their way Kornilov's companion was arrested, the general himself escaping and reaching Russia in the autumn of 1916. He was at once appointed commander of the XX. Army Corps. This corps operated in conjunction with the Rumanians and in Oct. 1916 made a brilliant diversion to save Bucharest from the invading army: but when the Rumanian troops on Kornilov's right gave way he had to retreat. At the beginning of March 1917, with the outbreak of the Russian Revolution, Kornilov was called by Gutchkov to command the troops of the military district of Petrograd. As in this appointment he was responsible for guarding the Provisional Government, it was from this moment that his influence on political events began to be felt. He found the troops, however, in such a demoralized state under the influence of the "Soviet of workers' and soldiers' deputies" that he asked to be relieved and sent to the front, and at the beginning of May he was made commander of the VIII. Army. During the June offensive movement ordered by Kerensky, who went round appealing to the soldiers to advance, Kornilov with his army broke the Austrian front and occupied Kalusz and Halicz, but the impetus was not of long duration and success was followed by débâcle. It now became clear that to restore the fighting capacity of the Russian army, stern decisive measures would have to be taken. Hopes were centred on Kornilov when he was appointed by Kerensky supreme commander-in-chief. "The man with the lion's heart" inspired a general confidence. At the beginning of August, just before the opening of the "State Conference" at Moscow, Kornilov went to Petrograd and presented his programme to Kerensky as president of the Provisional Government. This "programme" demanded the severe punishment of military offenders, not only at the front, but in the rear as well; it called for extraordinary measures for the improvement of transport and the insuring of order at the factories that were working for defence; it demanded the limitations of the privileges of the soldiers' committees and the reëstablishment of the officers' power of enforcing discipline. The programme was, however, rejected, and this was the beginning of the split between Kerensky and Kornilov (*see* RUSSIA: *History*). The gulf between the two men, who proclaimed two opposite political faiths, became wider, and the struggle between them ended in the outbreak of Sept. 8–12. Kerensky gained an apparent victory, and Kornilov, with some faithful followers, was interned in Bikhov, where he remained for over two and a half months. After the October revolution, when the Provisional Government had fallen and power was forcibly seized by the Bolsheviks, Kornilov left Bikhov and early in December made his way to the Don (Novotcherkask), where he assisted Gen. Alexeiev in collecting some 3,500 men and eight guns, and forming the Volunteer Army. Kornilov was given a command in this army, which was badly clad, had no winter equipment and hardly any munitions, but was ready to go anywhere and do anything. The position of the Don, however, grew more and more complicated. The sympathies of the population were divided and doubtful and the Bolshevik forces steadily advanced. The new army, still small in numbers and incompletely organized, was compelled to leave Rostov on Feb. 9 1918, and Kornilov then began his march to the Kuban, where he hoped to find help and support. Through country where the Bolsheviks held all the principal centres and railway lines his men fought their way victoriously but under great difficulties, and crossed the Kuban on March 7, having marched on to the mountain villages of the North Caucasian range and established connexion with a group of Volunteers which had formed under Gen. Erdeli. After a short rest they started again for Ekaterinodar, which, as the capital of Kuban, Kornilov held it essential to occupy. On March 17, in the neighbourhood of Novo Dmitrievskaya, they had to march knee-deep in water and to ford a mountain stream; the men reached the bank half frozen. This adventure was popularly known as the "ice flight." The attack in Ekaterinodar, however, resulted in a terrible misfortune. A stiff battle ensued and the Volunteer Army carried some of the outskirts of the town. But early on the morning of March 31 Kornilov was struck down by the burst of a shell and died without regaining consciousness. His loss was irreparable. A magnetic personality and born leader of men, he knew no fear and shared the hardships with his soldiers.

(Y. D.; P. Vi.)

**KOSSUTH, FRANCIS** (1841–1914), Hungarian statesman (*see* 15.916). As Minister of Commerce in the Wekerle Cabinet, Kossuth had many opportunities of turning to account his technical and economic experience. At the critical period of the Coalition he showed throughout solid ability, in contrast to Justh, who in 1909 brought about the break-up of the Independence party, which split into the Kossuth and the Justh wings. In consequence of increasing ill-health Kossuth withdrew more and more from active politics, and only appeared in Parliament on special occasions. When in the summer of 1913 the two wings of the Independence party were again united Count Michael Karolyi undertook their actual leadership. In articles published in the *Budapest* Kossuth continued to express his views. He made his last appearance in Parliament on Oct. 30 1913. From his bed of sickness, to which he was confined from the autumn of 1913 onwards, he declined any participation with Count Michael Karolyi against the Triple Alliance policy of the Dual Monarchy. He died May 25 1914. (E. v. W.)

**KÖVESS, HERMANN,** FREIHERR VON KÖVESSHAZA (1854– ), Austro-Hungarian field-marshal, was born in Temesvar in 1854, and began his military career in the engineers, then served on the general staff and in the infantry. At the beginning of the World War he commanded the XII. (Transylvania) Corps, and fought in the tenacious defence against the superior Russian forces in east and central Galicia, and later in Russian Poland. During the spring offensive of 1915 he captured by storm the fortress of Ivangorod, and in the autumn, under the command of Mackensen, led the III. Army, with which he captured Belgrade and penetrated into Serbia, then, in independent command, overthrew Montenegro, and occupied Albania. In the early summer of 1916 Kövess' army coöperated in the operation against Arsiero-Asiago, but after the break-through of Brussilov was transported in all haste to the Galician theatre of war. Kövess soon after took over the command of the VII. Army, and defended the ridges of the Wooded Carpathians against Russian attack. In the summer of 1917 he sallied from the mountains with his troops, made himself master of Csernowitz and Radautz, and drove the Russians almost entirely from the Bukovina. From the middle of Jan. to the beginning of April 1918 the field-marshal commanded the army front consisting of the I. and VII. Armies, extending from the Dniester to the south-eastern corner of Transylvania. Entrusted after the desertion of Bulgaria with the thankless task of the command of the troops in the Balkans, he could do nothing more than arrange for the evacuation of the occupied territories according to plan, and for the defence of the Danube-Save line. When the Emperor Charles laid down the supreme command he nominated Kövess as his successor. But the dispersal of the forces closed the field-marshal's military career. He was one of the most popular army leaders of the old monarchy. After its downfall he lived in retirement, cultivating his historical and artistic tastes.

**KROBATIN, ALEXANDER,** FREIHERR VON (1849– ), Austro-Hungarian field-marshal, was born at Olmütz in 1849. Krobatin was recognized as a sound technical expert in munitions; he did successful work as head of a department and as chief of a section in the War Ministry. From Dec. 1912 to April 1917 he was War Minister, and during the war supported the army in the field by bold and comprehensive measures. After his resignation from the Ministry of War he commanded the X. Army operating against Italy on the Carinthian and Tirolese fronts.

**KROPOTKIN, PETER ALEXEIVICH,** PRINCE (1842–1921), Russian geographer, author and revolutionary (*see* 15.928), returned to Russia in June 1917, after the revolution, expressing in a farewell letter to *The Times* his gratitude for the hospitality which he had received in England. His short period of residence in Russia was full of disappointment, as his criticisms of the Bolshevist regime caused him to be regarded with suspicion by the extremists. After various contradictory reports of his death had been received it was ascertained that he had died at Moscow after a long illness Feb. 8 1921.

**KRÜMMEL, OTTO** (1854–1912), German geographer, was born at Exin, near Bromberg, July 8 1854. He was educated principally in the university of Göttingen, and approached the subject of geography at first through the study of classics, and by the historical road. But in 1883 he succeeded to the chair of geography at Kiel, and in that seaport found the connexion of his subject with marine investigations which directed his subsequent career. He retained his chair at Kiel until 1911, and during his tenure of it he introduced the science of oceanography to public interest through his handbook *Der Ozean* (1886), completed Boguslavsky's work on oceanography in Ratzel's series of geographical handbooks (1887), joined, and published an account of, the "Plankton expedition" on board the "National" in the North Atlantic Ocean (1889), served on the International Council for the Study of the Sea (1900–9), and finally produced the great work of his life, the *Handbuch der Ozeanographie*, in 1907–11. In 1911 Krümmel quitted Kiel to take up the professorship of geography at Marburg. He died at Cologne Oct. 12 1912.

**KÜHLMANN, RICHARD VON** (1873– ), German diplomatist, was born March 17 1873 at Constantinople. From 1908 to 1914 he was councillor of the German embassy in London, and was very active in the study of all phases of contemporary political and social life in Great Britain and even in Ireland. During the World War he was successively councillor of embassy at Constantinople, minister at The Hague and, from Sept. 1916 till Aug. 1917, ambassador at Constantinople. He was then appointed Secretary of State for Foreign Affairs, and represented Germany at the Brest Litovsk negotiations, which on March 3 1918 led to the treaty of peace with Russia. He also negotiated the Peace of Bucharest (May 7 1918) with Rumania. In these negotiations he had to encounter the opposition of the Higher Command of the army, and, in particular, of Ludendorff, who desired fuller territorial guarantees on Germany's eastern frontier, the establishment of a German protectorate over the Baltic States and stronger precautions against the spread of Bolshevism. In July 1918 he delivered in the Reichstag a speech on the general situation, in the course of which he declared that the war could not be ended by arms alone, implying that it would require diplomacy to secure peace. This utterance was misinterpreted in the country, and the Higher Command was drawn into the controversy which arose over it, so that Kühlmann's position became untenable. He was practically thrown over by the Chancellor, Count Hertling, in a speech intended to explain away his statement and, after an interview with the Emperor at the front, he tendered his resignation (July 1918).

**KÜLPE, OSWALD** (1862–1915), German philosopher (*see* 18.242), was born at Candau, Courland, Aug. 3 1862. He was educated at the universities of Leipzig, Berlin, Göttingen and Dorpat; in 1891 he became lecturer in philosophy at Würzburg, holding subsequently (1894–1909) the chair of philosophy and aesthetics in that university, at Bonn (1909–13) and at Munich from 1913 until his death in 1915.

**KUN, BELA** (1886– ), Hungarian Communist leader, was born in 1886 of a Jewish family in Transylvania, and became a journalist and an official in the Workmen's Insurance Office in Kolozsvár. Enrolled in the Hungarian army during the World War, he was a prisoner of war in Russia, when he was instructed by Lenin for the purposes of Communist propaganda, and after the collapse of the Central Powers he was sent back to Hungary with a commission to set up a Soviet Republic. From March 21 to Aug. 1 1919 he was People's Commissary for Foreign Affairs in the Soviet Republic, and after its fall he found refuge in Austria (*see* HUNGARY). In July 1920 he succeeded in escaping to Russia, where he was employed by the Soviet Government.

**KUPRIN, ALEXANDER IVANOVICH** (1870– ), Russian writer, was born in 1870. He passed through the cadet school and military college at Moscow, and in 1890 entered the army as lieutenant. In 1897 he resigned his commission in order to devote himself to literature. He first made a name by his stories of Russian army life, and later wrote many satires on various sections of society. He is considered to be, after Chekhov, the most popular writer of short stores in Russia. His short stories include *Rekajizori* (The River of Life, 1916); *Duel* (first published 1907; English translation 1916) and *Sasha* (1920).

**KURDISTAN** (*see* 15.949).—During the last eight years of his reign Sultan 'Abdul-Hamid pursued the policy of attracting to his person those Kurdish leaders whom he found to have the greatest local power, and of creating the impression that he looked to the Kurds as his special adherents. There were at the time several descendants of the Badr Khan Bey and Baban families in exile in Constantinople, and from these certain members were given considerable Government posts in the capital and in Syria and Anatolia. By this means the Sultan contrived to exact some taxes, and succeeded in producing a state of the country more tranquil than had existed for several generations. In the north Ibrahim Pasha Milli, and in the south the Sheikh of Barzan and Sheikh Said Barzinja of Sulaimani, became the great leaders, while Saiyid Taha of Shemsdinan held the greatest power in central Kurdistan.

When in 1908 the Turkish Revolution occurred, resulting in the deposition of the Sultan and the victory of Enver Bey's Young Turk party, Kurdistan remained generally loyal to the old régime, and Ibrahim Pasha Milli and Sheikh Said of Sulaimani both declared themselves loyalists. The former gathered a considerable army and terrorized the country in the neighbourhood of 'Urfa, Diarbekr, Mardin and Nisibin, while Sheikh Said and the Sheikh of Barzan led a condition of rebellion extending over the whole of central and southern Kurdistan. In 1908 Sheikh Said of Sulaimani was murdered in Mosul, an event which only aggravated matters in southern Kurdistan and excited a sympathy for the family even deeper than had existed before. In 1909 Ibrahim Pasha Milli was defeated and lost his life and comparative order was restored in his district.

Meanwhile southern Kurdistan, led by Sheikh Mahmud, the son of Sheikh Said, continued in a state of rebellion, in which the two most active tribes were the Jaf and the Hamawand. Various means were tried to quell the rebellion. Sulaimani was occupied in 1910 after heavy bribes had been paid to Sheikh Mahmud; Mahmud Pasha, leader of the Jaf, was induced to go to Mosul and there detained for a year. Mustafa Pasha Bajlan, of the Khaniqin district, was likewise detained in Bagdad in 1912. In this year military measures at last succeeded against the Hamawand tribe, which fled *en masse* to Persian territory.

At the outbreak of the World War conditions were not favourable to the Turks in Kurdistan. An insurrection had occurred in Bitlis, the Hamawand were still virtually outlaws and the whole country refused to respond to the call to a *jihad* against the British. In the south a small volunteer force of cavalry was eventually raised, but after fighting against the British at Shu'aiba near Basra it returned to Kurdistan owing to the ill-treatment it received at the hands of the Turks. With the preoccupation of the Government in the war, Kurdistan remained for the time being untouched and indifferent.

In 1915 the official massacre of Armenians occurred, but

evidence conclusively proves that, though there were cases of Kurdish participation, the greater portion of the nation not only held aloof, but, as in the case of the Dersim Kurds (who actually saved 25,000 Armenians), displayed their repugnance to the Turkish orders in a practical manner. Throughout central and northern Kurdistan there were in 1919 numbers of Armenians who had lived as refugees among the Kurds.

About this time Russia began to formulate a policy to encourage the Kurdish national movement, for she hoped to use Kurdistan as a counterpoise to Armenia, and when in 1916 Russian forces were in possession of Erzerum and Bitlis, members of the Badr Khan Bey family were appointed as provincial governors in pursuance of the policy. In this year events happened which complicated political matters in Kurdistan. Isma'il Agha Shekak, better known as Simko, living between Van and Urmia, murdered the patriarch of the Nestorians, who fled to Persian territory and called upon the Russians to avenge the murder. In the same year a Russian force moved towards and occupied Rawanduz in central Kurdistan. This force was largely composed of Armenians and other Christian volunteers, calling themselves "the army of revenge," and the atrocities committed by them in the destruction of Rawanduz upon Kurds who had till then known nothing of them were in every way equal to anything attributed to Kurds in former massacres of Armenians. Further apprehension and unrest were caused in central and northern Kurdistan by the Sykes-Picot agreement, which provisionally assigned the Mosul vilayet to France, a Power regarded by the Kurds as violently pro-Christian.

Early in 1917 the Russians further alienated Kurdish sympathy by brutal treatment of the population of Khaniqin and the Shilyar valley in southern Kurdistan. The British forces, beyond a reconnaissance in April 1917, did not enter Kurdistan till Dec. 1917, when Khaniqin was occupied without opposition from the Kurds. In the early part of 1918 the desire for autonomy and the favourable attitude of Kurdistan to Great Britain was becoming apparent; at Sairt, in central Kurdistan, the Kurds actually expelled the Kurdish garrison, while leaders throughout the country contrived to get into touch with the British and assure them of their friendly sentiments and desire for autonomy and final independence of Turkey.

In Nov. 1918 an officer of the political department of the Mesopotamian Expeditionary Force was sent to Sulaimani, where he received a welcome from all classes. He appointed as governor Sheikh Mahmud Barzinja, and instituted a form of government designed to be acceptable to southern Kurdistan. A few other officers were sent at Sheikh Mahmud's request to assist in organizing the local Government under British protection. No troops entered the country. Meanwhile in the north, the Turks, alarmed at the rapid spread of pro-British and nationalist expression, busied themselves with propaganda which bore fruit to some extent on the northern borders of the Mosul vilayet, which was occupied by British troops in Nov. and Dec. 1918. The tribes in that neighbourhood are violently anti-Christian and have frequently been in armed opposition to British forces.

While propaganda and counter-propaganda were busy throughout northern and central Kurdistan, in May 1919 Sheikh Mahmud, who conceived that he had received ill-treatment at British hands in his capacity of governor of southern Kurdistan, effected a *coup de main* by which he filled Sulaimani town with Persian Kurd freebooters. He then entered upon a campaign, and, after defeating a small British force at Tasluja on May 26 1919, was himself defeated and captured wounded at Bazian Pass on June 20 1919.

Since the future status of Kurdistan had not been determined at that time by the League of Nations, those portions of it which fell south of the northern boundary of the Mosul vilayet were directed from Bagdad. The expedition of Major Noel in 1919 to northern Kurdistan had revealed a very general and genuine desire for separation from Turkey and independence.

The Treaty of Sèvres, signed on Aug. 10 1920, provided for these aspirations as follows (Section III.):—

(Article 62.) "A Commission sitting at Constantinople and composed of three members appointed by the British, French and Italian Governments respectively shall draft within six months from the coming into force of the present Treaty a scheme of local autonomy for the predominantly Kurdish areas lying east of the Euphrates, south of the southern boundary of Armenia as it may be hereafter determined, and north of the frontier of Turkey with Syria and Mesopotamia, as defined in Article 27, II. (2) and (3). If unanimity cannot be secured on any question, it will be referred by the members of the Commission to their respective Governments. The scheme shall contain in full safeguards for the protection of the Assyro-Chaldeans and other racial or religious minorities within these areas, and with this object a Commission composed of British, French, Italian, Persian and Kurdish representatives shall visit the spot to examine and decide what rectifications, if any, should be made in the Turkish frontier where, under the provisions of the present Treaty, that frontier coincides with that of Persia."

(Article 63.) "The Turkish Government hereby agrees to accept and execute the decisions of both the Commissions mentioned in Article 62 within three months from their communication to the said Government."

(Article 64.) "If within one year from the coming into force of the present Treaty the Kurdish peoples within the areas defined in Article 62 shall address themselves to the Council of the League of Nations in such a manner as to show that a majority of the population of these areas desires independence from Turkey, and if the Council then considers that these peoples are capable of such independence and recommends that it should be granted to them, Turkey hereby agrees to execute such a recommendation, and to renounce all rights and title over these areas.

"The detailed provisions of such renunciation will form the subject of a separate agreement between the Principal Allied Powers and Turkey. When such renunciation takes place, no objection will be raised by the Principal Allied Powers to the voluntary adhesion to such an independent Kurdish State of the Kurds inhabiting that part of Kurdistan which has hitherto been included in the Mosul vilayet."

Some suitable temporary status for the Kurds of the Mosul vilayet and the south, which are included in the British mandate, was under consideration in 1921. (E. B. S.)

**KUROPATKIN, ALEXEI** (1848– ), Russian general (*see* 15.952). After the Russo-Japanese War Kuropatkin retired to his estate in the Government of Novgorod, but during the World War, after repeated request, in 1916 he was appointed a corps commander. Once more he distinguished himself as a leader of troops, and he was again promoted to the position of army commander. Later he became commander of the Northern "front" (group of armies), but his operations in the spring offensive of 1916 did not restore his prestige as a higher commander, and he was shortly afterwards sent to Turkestan as governor-general. Here his wide and deep knowledge of conditions in that province proved very useful in maintaining order in an atmosphere of discontent. In 1917 Kuropatkin once more retired into private life.

The best known of his published works is *Plevna, Lovtchen and Sheinovo*. His memoirs were published after the Japanese War in four volumes, the fourth of which was forbidden in Russia and had to be published in Berlin. They were translated into English.

**KUSMANEK VON BURGNEUSTÄTTEN, HERMANN** (1860– ), Austro-Hungarian general, was born at Hermannstadt. He was in command of the fortress of Przemsyl when it was attacked in the first Russian campaign of the World War. It was only after a six months' investment and the repulse of powerful Russian onslaughts, and when the food supply was completely exhausted, that he surrendered on March 22 1915. Kusmanek and the garrison became prisoners of war. As a member of the War Archives Department he coöperated in the compilation of the *History of the War of the Austrian Succession*, and together with Maj. von Hoen wrote a manual on the sanitary service.

**KUYPER, ABRAHAM** (1837–1920), Dutch theologian and politician, was born Oct. 29 1837 at Maassluis, and was educated at the university of Leiden. He became Doctor of Divinity and pastor of the Dutch Reformed Church at Beesd in 1863, and in 1870 moved to Amsterdam, where he became in 1876 leader of the anti-Revolutionary party which aimed at the restoration of strictly Calvinistic doctrine in the guidance of State affairs. In 1879 he detailed fully the principles and wishes of his party in *Ons Program* (Our Programme). A few years later a Calvinistic university was formed through his instrumentality at Amster-

dam, and he himself became professor of theology. Under his leadership a considerable section of the old Netherland Reformed Church seceded in 1886 and founded the strictly orthodox Calvinistic Reformed Church Community. Until 1894 he devoted himself to religious teaching, and subsequently to politics, literature and journalism, having founded the *Standaard* and the *Heraut* in 1872, and contributing to it a daily front-page column of notes on current politics and theology. From 1874–7 he had sat in the Second Chamber, but in the latter year a serious illness forced him to resign his seat. In 1894 he was returned to the Second Chamber. In 1895 he defended the workers' right to strike, but in 1903, as head of the Government (1901–5), he crushed a railway strike by rushing a bill through Parliament making illegal a stoppage of work by those engaged in the public and semi-public services. This won him the enmity of the Dutch Socialists. As minister he conferred upon his Calvinistic university the *Jus Promovendi*. He deserves great credit for having converted the somewhat old-fashioned polytechnical school at Delft into a technical university which rivals the very best. During the South African War he took a prominent part in the attempts to get Holland to mediate between Great Britain and the Boers. In the World War he sided openly with Germany, but his influence had already greatly diminished. He was the author of numerous publications dealing mostly with religious subjects and held honorary degrees from various universities. A popular edition of his works appeared in 1896–8, and his parliamentary speeches were published in four volumes (1908–10). He also published a book describing the Dutch community in London in 1570–1. He died at The Hague Nov. 8 1920.

See W. F. A. Winckel, *Leven en Arbeid van Dr. Kuyper* (1921); Dr. A. Kuyper, *Gedenkboek* (1921) and A. S. S. and J. H. Kuyper, *De Levensavond van Dr. A. Kuyper* (1921).

**LABORI, FERNAND** (1860–1917), French lawyer, was born at Reims April 18 1860. He was educated at Reims and Paris, and spent several years in England and Germany. He was called to the bar in 1884, and rapidly made a reputation as a brilliant lawyer and advocate, being counsel for the defence in most of the important political trials of the day during a period of nearly thirty years. It was his conduct of the Dreyfus case, however, which placed him at the top of his profession and earned him his unique reputation. He fought with unremitting energy for his client during both the first and second revisions of the trial, in 1898 and 1899, a task attended with considerable danger, as political passions were so strongly excited at the time that Labori was shot at and wounded at Rennes on the eve of his cross-examination of the witnesses for the prosecution. Dreyfus was not finally declared innocent until 1906, and Labori never once relaxed his efforts on behalf of the unfortunate officer. Other notable trials in which he was concerned were the prosecution of Émile Zola for libel (1898), which arose out of the Dreyfus case; the Humbert affair (1902); and the trial of Madame Caillaux for the murder of M. Calmette, editor of the *Figaro* (1914), when he secured her acquittal. He died in Paris March 14 1917.

**LABOUCHERE, HENRY DU PRÉ** (1831–1912), Radical politician and proprietor of *Truth*, was born in London Nov. 9 1831, the son of John Labouchere, of Broome Hall, and nephew of Lord Taunton (*see* 26.453). He was educated at Eton, and, after spending a short time at Cambridge, entered the diplomatic service in 1854, becoming in 1863 second secretary to the British embassy at Constantinople. In 1864 he abandoned diplomacy for politics, and in 1865 was elected Liberal member for Windsor, but was unseated on petition. In 1866 he won a by-election for Middlesex, but failed to be reëlected in 1868. In 1880 he again entered the House of Commons as Radical member for Northampton with Mr. Bradlaugh as his colleague, and this seat he retained until his retirement in 1905. He began his journalistic career with the *Daily News*, of which he became part proprietor just before the Franco-German War, and he was himself the author of the *Letters of a Besieged Resident*, sent to that newspaper from Paris by balloon post during the siege, addressed to his wife in London. In 1874 he became associated with Edmund Yates on the *World* (*see* 28.908); but two years later he started *Truth* as a rival society paper, destined, as he himself said, "to be another and a better *World*." It had a remarkable record in the exposure of shams and organized impostures, especially frauds on the charitable. Many libel actions were brought against it, but in 25 between 1897 and 1907 only three verdicts were given definitely against the paper. For many years Mr. Labouchere himself contributed racy articles and notes, and he was to the end popularly identified with *Truth*, though in fact he left the direction in later years first to Mr. Horace Voules and then to Mr. Bennett, and took no active part either in writing or editing. He was a thorough Bohemian, and after his death the whole story of his life connexion with *Truth* was very candidly told in a series of admirable articles in its columns. As a politician "Labby" was the chartered jester of the House of Commons, but his pungent and somewhat cynical speeches were the expression of highly independent democratic convictions, deeply opposed to all forms of social privilege or Jingo imperialism. He was a strenuous advocate of the abolition of the House of Lords (*see* 20.845, 846); at the time of the Parnell Commission he had much to do with the unmasking of Pigott; and he was a member of the inquiry into the Jameson Raid, his hostility to Mr. Chamberlain being as pronounced as against Lord Rosebery when the latter became leader of the Liberal party. He considered himself entitled to office when his party was in power, and was decidedly mortified at not getting it from Mr. Gladstone. In 1868 he married Miss Henrietta Hodson, a popular actress. After 1903 he lived mainly in Italy, at a villa near Florence, where he died Jan. 15 1912. He left a fortune of some two millions sterling to his daughter, who married first a son of the Marquis di Rudini, and secondly Prince Gyalma Odescalchi.

See Algar Labouchere Thorold, *Life of Henry Labouchere* (1913).

**LABOR, DEPARTMENT OF** (United States): *see* LABOUR MINISTRY AND DEPARTMENT OF LABOUR.

**LABOUR LEGISLATION** (*see* 16.7*).—The decade 1910–20 was very productive of labour legislation, partly the natural outcome of years of agitation and the growing political power of Labour, and partly the result of the strong economic position in which Labour found itself as a result of the World War and the change of spirit which developed during it. While important progress has been made in connexion with the regulation of the conditions of employment of women, young persons and children, labour legislation has also advanced largely in new directions, such as the limitation of the hours of employment of all classes of workpeople, the fixing of minimum rates of wages for badly paid industries, and the development of social measures such as insurance against sickness, accident or unemployment. One of the most interesting developments, and one which may have far-reaching results, has been the movement towards international labour legislation.

The tendency towards uniformity in industrial conditions in the principal countries, and the world-wide increased economic and political power of the working-classes, had already resulted in a series of industrial laws in the various countries, very broadly on uniform lines. It would appear that Switzerland, in 1876, was the first country to invoke the aid of European diplomacy with a view to international labour legislation. Following on conferences in regard to international labour legislation held at Berlin in 1890, at Zürich in 1897, and at Paris in 1900, there was established in 1901 the International Association for Labour Legislation. By the international treaties of Berne of 1906, the use of white phosphorus in the match industry was forbidden in the interests of the health of the workers, and a night rest of 11 hours secured for female industrial workers.

A development in this direction, so great as to constitute a new era, came with the labour provisions of the Treaty of Versailles. These, together with the subsequent history of the International Labour Office set up under the treaty, are dealt with in the article on INTERNATIONAL LABOUR ORGANIZATION.

### UNITED KINGDOM

A series of Acts extending over more than a century had prescribed in the United Kingdom a detailed code for the protection of workers in factories, mines and shops, and especially for the protection of women, young persons and children. Labour legislation was tending strongly in new directions before the World War. Except for war purposes it was temporarily interrupted, but the importance which labour legislation had reached is indicated by the establishment of a separate Ministry of Labour (*see* LABOUR MINISTRY) by the New Ministries and Secretaries Act, 1916.

Before proceeding to a more detailed statement of the various Acts concerning labour that were placed on the statute book between 1910 and 1921, reference may be made to the point emphasized by Prof. Tillyard, that legislation in England is so usually associated with Parliament and with Parliament alone, that it may not be generally realized that, taking into consideration quantity only and disregarding importance, probably the larger part of existing enactments regarding labour have not been directly passed by Parliament but are the creation of inferior bodies to whom law-making powers have been delegated. The reason is that industrial legislation in many cases can hope to be successful only on condition that complicated details are patiently investigated and interested persons listened to. Parliament has of late years become more and more content to

** These figures indicate the volume and page number of the previous article.*

settle principles, and to leave detailed decisions and the working-out of extensions to other bodies, reserving to itself a varying amount of ultimate control. This legislation by inferior law-making bodies takes several forms:—

(*a*) Provisional Orders, made by Government departments and having the force of law provided they are expressly sanctioned by Parliament, *e.g.* under the Workmen's Compensation Act, 1906;

(*b*) Statutory Orders, made by Government departments and requiring to be laid before Parliament for varying periods, but taking effect unless Parliament actively intervenes, *e.g.* under the Factory Acts;

(*c*) Determinations such as those under the Trade Boards Acts dealing with wages to be paid in specified trades;

(*d*) Legislation by local by-laws made by local authorities in exercise of the permissive powers bestowed by Act of Parliament.

*Women and Children.*—As regards recent legislation on the subject of the employment of women, young persons and children, it is to be observed that important measures regarding the employment of children were embodied in the Education Act, 1918, which consolidated and amended the various Acts relating to the national system of public education. But, owing to financial exigencies, the operation of several provisions of this Act was postponed in 1920–1.

Under the Act, subject to specified exceptions, no exemption from school attendance may be granted to any child between the ages of 5 and 14 years, and 15 years is substituted for 14 years as the normal elementary school-leaving age. Subject to certain conditions, all young persons are required to attend continuation schools for a specified number of hours in each year, at such times or on such days as the local education authority may require; and the local education authority may require, in the case of young persons who are under an obligation to attend a continuation school, that their employment shall be suspended on any day when their school attendance is required. The Employment of Children Act, 1903, is also amended so that a child under the age of 12 may not be employed, and a child of the age of 12 or upwards may not be employed on any Sunday for more than 2 hours, or on any day on which such child is required to attend school before the close of school hours on that day, nor on any day before 6 o'clock in the morning or after 8 o'clock in the evening. By a further amendment of the Act of 1903, the employment of children in street trading is prohibited, and certain amendments are made to the Prevention of Cruelty to Children Act, 1904, in so far as that Act deals with the employment of children for the purpose of singing, playing or performing, or being exhibited for profit or offering anything for sale. The local education authority may further, if they are satisfied by a report of the school medical officer or otherwise, that any child is being employed in such a manner as to be prejudicial to his health or development or as to render him unfit to obtain the proper benefit from his education, either prohibit or attach such conditions as they think fit to his employment. No child (which expression is defined to mean any child up to the age when his parents cease to be under an obligation to cause him to receive efficient elementary instruction or to attend school under the enactments relating to elementary education and the by-laws made thereunder) may be employed in any factory or workshop to which the Factory and Workshop Acts, 1901 to 1911, apply: or in any mine to which the Coal Mines Act, 1911, applies: or in any mine or quarry to which the Metalliferous Mines Acts, 1872 and 1875, apply: unless lawfully so employed when the Education Act becomes operative. The Education (Scotland) Act, 1918, is broadly on the same lines, although it differs in details.

A further important step was taken by the Employment of Women, Young Persons and Children Act, 1920.

Its main purpose was to give legislative ratification in the United Kingdom (*a*) to three draft conventions adopted at Washington by the first session of the General Conference of the International Labour Organization of the League of Nations, fixing 14 as the minimum age for the admission of children to industrial employment, and prohibiting, with certain exceptions, night-work in industrial undertakings by young persons under the age of 18 and by all women without distinction of age, and (*b*) to the draft convention fixing the minimum age for the admission of children to employment at sea, adopted at Genoa by the second session of the General Conference. The Act also contains a section permitting double shifts (averaging each not more than 8 hours per day) for women and young persons between the hours of 6 A.M. and 10 P.M., subject to any conditions which the Secretary of State may prescribe. The object of this section was to continue the powers of the Home Secretary in this respect which, in the emergency of the war, he had exercised under section 150 of the Factory and Workshop Act, 1901, as extended by Defence of the Realm Regulation No. 6, A. The provisions of the clause aroused considerable opposition, and, during the progress of the bill through Parliament, a departmental committee was appointed to inquire into the whole question of allowing women and young persons to be employed on the system of two-day shifts. The committee decided generally that the Home Office should retain its existing power of deciding in which cases the adoption of the system should be allowed, and that for this purpose the adoption of the system in any works should be dependent upon the issue of a Home Office Order and subject to such conditions to secure the welfare of the workers as might be attached by the Home Office. The relevant section of the Act also provides that the Secretary of State may not make an order in any industry if objection is jointly made by organizations representing the majority of employers and workers in the industry; the section and orders made thereunder are to remain in force for a period of five years and no longer.

The Women and Young Persons (Employment in Lead Processes) Act, 1920, prohibited the employment of women and young persons in certain processes connected with lead manufacture, and regulated their employment in certain processes involving the use of lead compounds in accordance with the recommendation of the Washington Conference concerning lead-poisoning.

*Hours.*—In addition to the above special measures concerning the employment of women, young persons and children, a bill was introduced in 1921 by the Minister of Labour, providing, subject to certain necessary exceptions and conditions, for the establishment of a maximum working week of 48 hours. A measure for this purpose was recommended by the provisional joint committee appointed by a National Industrial Conference of employers and workpeople held in Feb. 1919, to consider means for removing the existing labour unrest, and by the Washington General Conference. The terms of the bill were still under discussion in 1921. Hours of employment in the coal-mining industry and in shops have been regulated by special measures. (*See* HOURS OF LABOUR.)

*Coal-Mines.*—The coal-mining industry has been the subject of a number of special laws, which may be accounted for by the vital position which the industry holds in the economic life of the community, the strong organization of the workers, and the exceptional conditions under which the work has to be carried on. The Coal Mines Act, 1911, amended slightly by the Coal Mines Act, 1914, consolidated the existing law relative to coal-mines. The Act deals with management (certificates of competency, etc.); provisions as to safety, health, accidents; employment of boys, girls and women; prohibition of payment of wages in licensed premises and provision as to weekly payment of wages; inspectors, etc. It did not, however, amend the Coal Mines Regulation Act, 1908, relating to the 8-hour day, nor such part of existing legislation as related to checkweighing. In 1912 the Coal Mines (Minimum Wage) Act was passed to terminate a general strike of coal-miners and provided that certain district minimum rates, fixed by district boards under the Act, should form part of the terms of contract of every person employed underground in a coal-mine.

During the World War the Government assumed control of the coal-mines. Early in 1919 the Coal Industry Commission Act was passed, in connexion with a threatened general strike of coal-miners, to enable the Government to set up a commission to inquire into the condition of the industry. In accordance with an interim report of this commission, the Coal Mines Act, 1919, was passed, providing for a reduction, as from July 16 1919, of the hours of labour of coal-mine workers below ground from 8 to 7 per day, and making provision, contingent upon the condition of the industry, for a further reduction in 1921.

The Mining Industry Act, 1920, established the Mines Department of the Board of Trade for the exercise of the powers of that department and also of the transferred powers of the Secretary of State relating to mines and quarries.

This Act authorized the Board of Trade, for a period of one year from Aug. 31 1920, to issue directions regulating the export of coal and the supply of coal for the bunkering of vessels, and regulating the pithead price to be charged for coal sold for consumption in the British Isles and for the bunkering of vessels other than vessels proceeding to ports outside the British Isles. While any such directions are operative, the Board of Trade can also give directions as to the wages to be paid to workers in coal-mines and to regulate the distribution of profits on principles similar to those shown in the Coal Mines (Emergency) Act, 1920, so as to secure as far as practicable an equitable distribution as between the different collieries.

The Act further provides for the constitution of (*a*) Pit Committees for each coal-mine where a resolution in favour thereof is passed by the majority of the workers employed in or about the mine; (*b*) District Committees; (*c*) Area Boards, and (*d*) a National Board. Pit

committees consist of representatives, not exceeding 10 in number, of the owners and management of the mine and the workers employed in or about the mine, selected by ballot. The functions of a pit committee are to discuss and make recommendations with respect to (*a*) the safety, health and welfare of the workers in connexion with their work in the mine; (*b*) the maintenance and increase of output; (*c*) reports made on an inspection under section 16 of the Coal Mines Act, 1911, which reports shall be referred to the committee by the manager; (*d*) disputes arising in connexion with the mine, including disputes as to wages; and (*e*) any other questions and matters relative to the mine which may be prescribed by the regulations to be drawn up by the Board of Trade. Any matters which cannot be satisfactorily disposed of by a pit committee are to be referred to the appropriate district committee, or, in the case of questions to which the Coal Mines Act (1911) applies, to the inspector of the division. To enable a pit committee to exercise its functions on the first two points indicated above, it is required that the committee should be furnished by the manager of the mine with such relevant information as may be necessary for its purpose and may appoint members to make periodical inspections of the mine.

The district committees and the area boards, which likewise consist of representatives of the owners and the management and an equal number of representatives of the workers, consider questions of a similar nature; a district committee is also required to consider any matter referred to them by a pit committee or by the area board or the Board of Trade, and the area board is required to consider any questions which may be referred to it by a district committee or by the national board or the Board of Trade. An area board is in addition required to formulate, at such intervals and on such principles as may be prescribed by the national board, schemes for adjusting the remuneration of the workers within the area; the Board of Trade may by regulation provide for district committees or area boards determining any question and exercising any powers which, before the passing of this Act, were determined or exercised by a conciliation board or by a joint district board constituted under the Coal Mines (Minimum Wage) Act, 1912.

The national board, which is equally representative of owners and workpeople, is required to take into consideration questions, including wages questions, affecting the coal-mining industry as a whole, any questions which may be referred to them by an area board, and any questions which may be referred to them by the Board of Trade. The national board is also to determine, subject to the approval of the Board of Trade, the principles on which schemes by area boards for adjusting the remuneration of workers are to be framed. Where any recommendation made by a district committee or area board or by the national board, or any scheme made by an area board and approved by the national board, has been forwarded or referred to the Board of Trade, the Board of Trade may give directions requiring any person engaged in the coal-mining industry to comply therewith.

A further provision of the Act requires the constitution of a fund to be applied to such purposes connected with the social well-being, recreation and conditions of living of workers in or about coal-mines, and with mining education and research, as the Board of Trade, after consultation with any Government department concerned, may approve; and the owners of every coal-mine are required for a period of six years to pay a sum equal to 1d. a ton of the output of the mine for the creation of such a fund.

*Shops.*—Further legislation has been enacted in regard to employment in shops. The Shops Regulation Acts, 1892–1911, were consolidated by the Shops Act, 1912, which contains various provisions for protecting shop assistants.

The Act requires *inter alia* that, on at least one weekday in each week, a shop assistant may not be employed about the business of the shop after 1:30 P.M.; it contains requirements as to intervals for meals, and further requires that no person under the age of 18 years is to be employed in or about a shop for a longer period than 74 hours (including meal times) in any one week. Besides these provisions, the Act contains provisions under which every shop, save for exceptions allowed by the Act, must be closed for the serving of customers not later than 1 P.M. on one weekday in every week; closing orders may also be made fixing the hours on the several days of the week at which, either throughout the area of a local authority or in any specified part thereof, all shops or shops of any specified class are to be closed for the serving of customers, but the hours fixed by the closing order may not be earlier than 7 P.M. on any day.

The Shops Act, 1913, amended the Act of 1912 in its application to premises for the sale of refreshments. The Shops (Early Closing) Act, 1920, continues Regulation 10 B. of the Defence of the Realm Regulations, as amended, and requires that, subject to certain specified exceptions, every shop shall be closed for the serving of customers not later than 8 o'clock in the evening on every day other than Saturday and not later than 9 o'clock in the evening on Saturday.

*Minimum Wage.*—One of the most important developments of labour legislation in recent years has been minimum-wage legislation. Minimum-wage boards had been in existence for some time in Australasia before they were tentatively introduced into the United Kingdom by the Trade Boards Act, 1909, followed by the Trade Boards Act, 1918 (*see* TRADE BOARDS). The latter empowers the Minister of Labour to extend by Special Order the provisions of the Trade Boards Act, 1909, to other trades, and under its provision trade boards have now been set up in a large number of trades. The Corn Production Act, 1917, extended similar legislation to agriculture. A rather different kind of minimum-wage legislation was that embodied in the Coal Mines (Minimum Wage) Act, 1912, which was passed to terminate a general strike of coal-miners in respect of their claims for "individual district minimum rates." The method of administration of the Act is different from that of the Trade Boards Acts: no inspectorate was appointed, the payment of the minimum rate being part of the workman's contract of service and enforceable in an ordinary court of law.

The Munitions of War Acts, 1915–7, contained provisions which enabled minimum rates of wages to be fixed. These were repealed, however, by the Wages (Temporary Regulation) Act, 1918, the purpose of which was to secure that the standard district rates existing at the date of the Armistice should be continued during the transition period when industry was changing from war to peace conditions. It was extended to Nov. 21 1919 by the Wages (Temporary Regulation) Extension Act, 1919, and the principle of the Acts was continued up to Sept. 30 1920 by the Industrial Courts Act, 1920. In connexion with this subject it should be recorded that the Industrial Conference of 1919 recommended the enforcement by legal enactment of minimum time rates of wages to be of universal applicability.

*Old Age and Sickness.*—For an account of the recent considerable developments in the United Kingdom in connexion with unemployment insurance, *see* UNEMPLOYMENT. Legislation of widespread social importance has been undertaken in a series of measures designed to relieve distress arising from old age or sickness. The Old Age Pensions Act, 1908, under which, subject to certain conditions as to means of support, etc., a pension at the rate of 5s. per week became payable to persons who had attained the age of 70, was preliminary to the National Health Insurance Act of 1911, which instituted, with certain specified exceptions, a universal scheme of compulsory insurance against sickness. Contributions are payable by the insured person and by the employer, and in return the insured person receives certain benefits. These benefits in the main are:—

(1) Sickness benefit, *i.e.* a periodical money payment to the insured person while rendered incapable of work by some specified disease, either bodily or mental;

(2) Disablement benefit, *i.e.* a periodical payment after the right to sickness benefit has been exhausted, and continuing so long as the incapacity continues;

(3) Maternity benefit, being a lump-sum payment in the case of the confinement of an insured woman, or the wife or widow of an insured man;

(4) Medical benefit, being medical treatment and attendance and the provision of medicine and of prescribed medical and surgical appliances; and

(5) Sanatorium benefit, being the treatment of persons suffering from tuberculosis or any other disease specified by the Ministry of Health.

Sickness and disablement benefits cease when the insured person reaches the age of seventy. The Act is administered largely through approved societies, these being principally friendly societies, trade unions, and industrial insurance societies.

The Old Age Pensions Act was amended in certain respects in 1911 and the National Insurance Act in 1913, 1914, 1915, 1917, and 1918. As a result of the war, certain other amendments became necessary in order to bring the rates of money contributions and benefits into closer relationship with the lessened value of money and the higher cost of living. During the latter part of the war, additional allowances were paid in view of the increased cost of living: the Old Age Pensions Act, 1919, increased the weekly sum to 10s. per week and made various other amendments to earlier Acts.

It may also be noted that the Blind Persons Act, 1920, provides

that every blind person who has attained the age of 50 shall be entitled to such pension as, under the Old Age Pensions Acts, 1908–19, he would be entitled to receive if he had attained the age of 70. In the case of the health insurance scheme, the National Health Insurance Act, 1919, increased from £160 to £250 per annum the rate of remuneration for the purpose of exemption from insurance; and the National Health Insurance Act, 1920, amended the scales of weekly contributions and benefits.

*Workmen's Compensation.*—Reference may also be made to the Acts dealing with compensation to workpeople in the event of accidents which occur notwithstanding the preventive measures required by the Factory and Workshops Acts, Coal Mines Regulation Acts, Railway Employment (Prevention of Accidents) Act, Merchant Shipping Acts and kindred legislation.

Originally, under the common law of England, all workmen suffering injury, as the result of the negligence or wilful act or omission of an employer, might sue for damages. Lord Campbell's Act of 1846 introduced an improvement whereby, if the injury resulted in death, relatives of a specified relationship might bring an action; previously the right to bring an action had been deemed to die with the injured person. The Employers' Liability Act of 1880 introduced further changes, as also did the Workmen's Compensation Acts of 1897 and 1900, which were repealed by the Workmen's Compensation Act of 1906 under which any injured workman (or his relatives in case of death) can recover compensation from the employer, if the accident arises out of and in the course of his employment. The employer cannot protect himself by proving either contributory negligence or common employment. The amount of compensation is limited to £300 in case of death and £1 per week in case of injury.

Amendments in details were made by Acts of 1918, and as a result of the fall in the value of money brought about by the war, the Workmen's Compensation (War Addition) Act, 1917, increased the compensation payable in the event of total incapacity by 25% and the Workmen's Compensation (War Addition) Amendment Act, 1919, again increased it by 50%, making the maximum allowance 35s.

Another step necessitated by the war was the Disabled Men (Facilities for Employment) Act, 1919, which enables arrangements to be made to relieve or indemnify an employer in respect of the whole or part of any increase of expenditure arising from his liability to pay compensation in respect of accidents or industrial disease, where such increase is attributable to the employment of men disabled in the war. It may further be noted that a committee appointed by the Home Secretary presented a report in July 1920, recommending various modifications of the present system and a considerable widening of the scope of the 1906 Act.

*Trade Unions.*—Recent years have witnessed in the United Kingdom a remarkable growth in the trade-union movement, and also some changes in the legal status of trade unions. Thus, following on the Trade Disputes Act of 1906, the Trade Union Act, 1913, made provisions relative to the application of trade union funds for political purposes, and the Trade Union Amalgamation Act, 1917, amended the Act of 1876 in respect to the amalgamation of trade unions. The growth of the unions has been followed by legislation to meet emergencies in strikes.

The Conspiracy and Protection of Property Act, 1875, contained a provision whereby a person employed in a gas or water undertaking was liable to penalties if he "wilfully and maliciously breaks a contract of service . . . knowing or having reasonable cause to believe that the consequence of his so doing, either alone or in combination with others, will be to deprive the inhabitants of that city, borough, town, place or part, wholly or to a great extent, of their supply of gas or water." A similar provision was contained in the Electricity (Supply) Act, 1919, in respect of electrical undertakings. Attention should be called in this connexion also to the Police Act, 1919, which, while it does not directly prohibit strikes in the police forces, adopts an indirect method by forbidding members of the police forces from becoming members of "any Trade Union or of any Association having for its objects, or one of its objects, to control or influence the pay, pensions, or conditions of service of any Police Force." In the autumn of 1920 the Emergency Powers Act was passed, enabling His Majesty, in the event of action being taken or threatened which would be likely to interfere with the supply or distribution of food, water, fuel or light, or with the means of locomotion, or to deprive the community or any substantial proportion of the community, of the essentials of life, by proclamation to declare the existence of a state of emergency; where such a proclamation has been made it shall be lawful for the Government to make regulations for the preservation of the peace and for securing and regulating the supply of the public necessities.

*War Measures.*—Reference has been made to some of the special measures necessitated by the World War; these include legislation directly for war purposes, such as the Munitions of War Acts, designed to increase the output of munitions; Defence of the Realm Regulations, such as those concerning incitement to strike; employment of women under the two-shift system, and the closing hours of shops. The war also indirectly necessitated, through the change in the value of money, amendments to the Insurance Acts, Old Age Pensions Act, and Workmen's Compensation Acts.

A war measure to which attention may specially be called is the Restoration of Pre-War Practices Act, 1919. In connexion with the steps taken at the beginning of 1915 to increase the output of munitions, the Government held conferences with representatives of a large number of trade unions and came to an understanding known as the "Treasury Agreement," whereby the unions agreed to relax such trade practices as tended to restrict output of munitions or equipment, on condition that their position in regard to such practices after the war should not be prejudiced by relaxation during the war. Certain provisions in this respect were embodied in the Munitions of War Act, 1915. The Restoration of Pre-War Practices Act, passed in Aug. 1919 (which applied only to establishments in which munitions work was carried on during the war, and to other establishments in which a departure from practice was made in consequence of the Treasury Agreement or in pursuance of some other agreement in writing), provided that the owner of the establishment should be under obligation from Oct. 1919 to restore the trade practice previously obtaining, and to maintain the practice for 12 months. Failure to comply with the obligation rendered him liable to prosecution before a munitions tribunal. In nearly every case the practices were restored where the workpeople so desired.

*Miscellaneous.*—Among other miscellaneous labour legislation, attention may be called to the following Acts: The Factory and Workshop (Cotton Cloth Factories) Act, 1911, enabled the Secretary of State to make any regulations which he deemed necessary for the purpose of giving effect to the recommendations contained in the second report, dated Jan. 1911, of a committee appointed in 1907 to inquire into the question of humidity and ventilation in cotton-cloth factories. The Checkweighing in Various Industries Act, 1919, provides for "checking the weight or measurement of materials produced, handled or gotten by workmen paid by weight or measure in certain industries," including the production or manufacture of iron or steel, the loading or unloading of goods into or from vessels, the getting of chalk or limestone from quarries, and the manufacture of cement and lime. Provision is made for the inclusion of other materials by regulation.

### Other Countries

*Eight-hour Day.*—The movement for reduced hours of labour which set in after the signing of the Armistice was world-wide, and, either by way of legislation or by agreement between the representatives of employers and workpeople, the length of the working day formerly in operation has been curtailed in many countries.

In *France* the Labour Code was amended by a general 8-hour-day law passed in April 1919, and in June the existing legislation as to the length of the working day in the mining industry was amended by extending the 8-hour day to all classes of workpeople, whether employed underground or on the surface. Previously, under a law of Dec. 1913, the limit of 8 hours per day had applied only to workpeople employed underground. In Aug. 1919, a similar limit was enacted for all persons employed in French vessels.

In *Germany* one of the first enactments of the Provisional Government was a law fixing an 8-hour day for all industrial workers, special arrangements being made to meet the case of transport workers and of those employed in establishments in continuous operation. In Jan. 1919, the German Government issued a new code in respect of agricultural labour, fixing a limit for the hours of labour of agricultural workers—in four months of the year the average hours not to exceed 8 *per diem*, in four months 10, and in four months 11.

From Nov. 1918 onwards, laws or decrees have also been passed fixing 8 hours per day (or alternatively 48 hours per week) as the normal working time in *Switzerland*, *Holland* (45-hour week, *i.e.* 8-hour day for five days of the week and a half-holiday on Saturday), *Denmark* (in respect of establishments with continuous working as from the commencement of Jan. 1920), *Norway*, *Sweden*, *Spain*, *Poland*, *Czechoslovakia*, *Austria*, etc. It may, however, be noted that it has been deemed necessary to grant temporary exemptions from the strict statutory application of the 8-hour day in France, Austria and the Netherlands; and in all cases certain exceptions are permitted in respect of national emergency, such as war, accident and unforeseen circumstances, subsidiary and complementary processes requiring to be done before the main work can begin or after it has ceased, adjustment of shifts, seasonal trades, and emergencies, as,

for example, in order to prevent industrial dislocation. Conditions are usually attached to any relaxation of, or exemption from, the normal limit of hours.

In several countries a shorter working day has been introduced by agreement between employers and workpeople, thus anticipating or supplementing legislation on this point. This method has been largely adopted in Italy, the United States, etc. In Australia the 8-hour day, or 48-hour week, has been in operation for many years either by agreement or arbitration award.

*Hours of Women and Children.*—A great deal was done, in various countries, to improve conditions under this heading during 1910–20 (*see* HOURS OF LABOUR).

*France.*—A law dated 1911 amended the law of Nov. 1892, on the labour of women and children in industrial establishments, so as to bring it into accord with the Berne Convention on night-work of women. The provision of the earlier law, prescribing that young persons of less than 18 and women might not be employed between the hours of 9 P.M. and 5 A.M., was retained, and in addition it was laid down that such persons must have not less than 11 consecutive hours of rest at night. In the case of lads and boys working underground in mines and quarries, work might, as before, be authorized from 4 A.M. to 10 P.M., provided that it was divided into two shifts of not more than 9 hours each, broken by an interval of at least one hour. For women over 18 employed in certain trades, to be determined by ordinance and on due notice being given, work might continue up to 10 P.M. (formerly 11 P.M.) at certain periods of the year for not more than 60 days in the year, but in no case must the number of hours worked per day exceed 12. In these trades and in trades in which, under Article 7 of the law of 1892, the restrictions as to the length of the daily hours of labour might be temporarily suspended by ordinance, the consecutive rest period might be reduced to 10 hours. Temporary exemptions might be made in the case of certain industries determined by ordinance, and, as before, permission to work beyond the usual hours, or to shorten the period of nightly rest, might also be granted in the case of stoppages due to accident or unforeseen occurrences. A law of June 1913 was passed for the protection of women workers before and after childbirth. By a law dated 1917, the principle of freedom from work on Saturday afternoons was laid down for women employed in the clothing trades in France. A law dated 1919, and operating as from Oct. 1920, prohibited employment in bakeries between 10 P.M. and 4 A.M.

*Belgium.*—A law passed in April 1911 amended the existing laws, and, among other provisions, required the abolition of the underground labour of all females and of males under 14 years of age, as from the beginning of the third year from the date of promulgation. By a law of Aug. 1911, night-work of women and girls was prohibited in industrial establishments in which more than 10 workpeople are employed, and every woman or girl employed in such establishments must be granted not less than 11 consecutive hours of rest at night, this period of rest including the interval from 9 P.M. to 5 A.M. Exceptions were made in the case of seasonal trades, unforeseen circumstances and materials liable to rapid deterioration.

*Switzerland.*—In 1915, the Swiss Factory Act of 1877, which was amended in certain respects in 1905, was superseded by a new Act. As in the former law, women are forbidden to work at night or on Sundays. A new provision states that the Federal Council is to prescribe the branches of work or particular occupations in which women may not be employed under any circumstances. Women must have a night's rest of at least 11 consecutive hours, including the period from 10 P.M. to 5 A.M.; but by special permission this may be reduced to 10 hours for 60 days in the year, or, when perishable materials are being worked upon, for 140 days. The former law provided that, for a period in all of 8 weeks before and after confinement, women should be exempted from work in factories; the later law provides for their exclusion from work in factories for 6 weeks following confinement, which period, at their request, may be extended to 8 weeks. The later law retains the limit of 14 years as the minimum age at which children may be allowed to work in factories, and also the provision forbidding the employment of young persons under 18 at night-work and on Sundays. A new provision states that children under 16 may not be employed upon work where the normal hours are exceeded, and the Federal Council is to prescribe certain branches of industry or certain occupations at which young persons under 16 must not be employed at all. The new law also reduced the length of the working-day in factories from 11 to 10 hours.

*Holland.*—A royal decree dated Oct. 1911 approved the text of a labour law amending the regulations hitherto in operation governing the employment of young persons and women in industry in the Netherlands. No child under the age of 13 might be employed in an industrial establishment, nor any person over that age not exempt from school attendance. Previously the minimum age of admission had been 12 years. The hours of labour of young persons (defined as those under the age of 17) and women in factories, etc., might not exceed 10 per day or 58 per week (instead of 11 per day as before), nor might these workers be employed, as a general rule, before 6 A.M. or after 7 P.M. (formerly 5 A.M. and 7 P.M.). Women having household duties to perform, and making a declaration to that effect, might not be employed after 1 P.M. on Saturdays; and by ministerial order no young person or woman might be employed after that hour in any or in certain specified trades. Under a labour law of 1919, any work by children under 14 years of age or by those to whom the Education Act is applicable is prohibited as from July 1921. Young persons (*i. e.* persons between 14 and 18) are not to work on Sundays, except *outside* factories, workshops, shops, offices, etc. Young persons may not work *outside* factories, workshops, shops, etc., between 7 P.M. and 6 A.M.; in shops and in coffee-houses and hotels between 8 P.M. and 8 A.M.; in offices between 6 P.M. and 8 A.M. In factories, workers over 15 may do certain defined work, or work under certain defined conditions, between the hours of 6 P.M. and 10 P.M. and between 5 A.M. and 7 A.M. By royal decree, certain kinds of work, or work under certain conditions to be defined by such decree, may not be done by young persons or women on the ground of its danger to health, morality or life. Women may not work for at least 2 weeks before, and 6 weeks after, confinement.

*Norway.*—The Norwegian Factory Act of 1909, together with amending laws dated 1910 and 1911, was superseded by a law dated Sept. 1915. With the exception of new provisions relating to daily working hours and night-work, the 1915 Act was practically identical with that of 1909. The most important change introduced by the new clauses is the limitation of the working hours of adults employed in factories, irrespective of sex, to 10 hours per day, or 54 weekly. In the previous law no regulations whatever were included with regard to working hours of adults (defined as persons over 18 years of age). In the case of persons employed in mines (so far as concerns underground work), foundries, and book and newspaper printing works, the hours of labour as a general rule are not to exceed 48 per week. For the first time in Norwegian factory legislation, the law made general regulations as to night-work, which is defined as work performed between the hours of 9 P.M. and 6 A.M. As a rule, special permission is required for night-work, except with regard to adult workers in continuous trades. The provisions as to hours of labour and night-work do not apply to adults employed in stores and warehouses, building works and yards, wharves, loading and unloading steamships and analogous occupations, or to those employed in handicraft workshops not using mechanical power; nor are adults employed in paper, cellulose and wood-pulp factories, in which work is continuous, affected by the new provision.

*Sweden.*—A new law for the protection of workpeople, dated 1912, consolidated, completed, and superseded all laws and regulations previously enacted for safeguarding workpeople against accident and other risks of employment, with the exception of (1) the law of Nov. 1909, forbidding the employment of women on night-work in certain trades; (2) the decree of Dec. 1897, regarding the employment of children in public exhibitions; and (3) the decree of Dec. 1896, for the prevention of "phossy jaw." New provisions for reducing risk of accidents were laid down with special reference to the testing of steam boilers, vats, etc., liable to explode. Among new provisions for ensuring healthy conditions of work may be mentioned the increase of the minimum air-space in workrooms from 247 to 353 cub. ft. per worker. The provisions affecting minors were of a wider character than those contained in the former law regarding these employees. The old law had reference only to those employed in factories or in analogous occupations, whereas the new law was extended to occupations other than those conducted in factories. The age-limit for minors of both sexes imposed by the previous law was 12 years. This was now raised to 13 years for boys and 14 for girls. The old limit was retained for employment other than in factories, *e.g.* in handicrafts and in shops. The age of minors employed in mines or quarries was advanced from 14 to 15 years. In addition, the hours of employment of young persons were more completely regulated than formerly.

*Spain.*—By an Act dated July 1912, the employment of women during the night-time in factories or workshops is declared to be illegal in Spain. "Night-time," within the meaning of the Act, covers a period of not less than 11 consecutive hours, in which must be comprised the time between 9 P.M. and 5 A.M. The foregoing prohibition does not apply (*a*) in cases of *force majeure*, (*b*) in agricultural enterprises, or in trades in which perishable materials are used, provided, as regards the latter, that their loss cannot be avoided without resort to night-work. By a royal decree dated April 1919, work is forbidden in bakehouses, factories and other places where bread is made for a period of 6 consecutive hours in each 24, which period must fall between 8 P.M. and 5 A.M.

*Austria.*—A new law of Dec. 1911 amended the law of 1884 in respect to the employment of women and children in mines. By a law of Feb. 1911, the employment of women and girls between the hours of 8 P.M. and 5 A.M. is prohibited in any industrial establishment in Austria in which more than 10 workpeople are employed (in the case of raw sugar factories, the law was not to come into operation till 1915). Furthermore, every woman or girl must be granted not less than 11 consecutive hours of rest at night. If, however, work is done in shifts of not more than 8 hours, this 11-hour rest period may commence at 10 P.M. in the case of women over 16 years of age. Special provision is made for unforeseen circumstances, seasonal trades and trades where raw materials are subject to rapid deterioration. It was reported in 1919 that a new Act containing similar provisions, and including also young persons, came into force in German Austria as from June of that year.

*Japan.*—A new factory law was passed in Japan in 1911, whereby the minimum age of employment in factories is 12 years. The administrative authorities may sanction the employment of minors between 10 and 12 years of age when the work is not too exacting, at the same time imposing conditions as to such employment. Lads under 15 and females must not be employed for more than 12 hours per day. For a period of 15 years from the date of the enforcement of the law the minister concerned may, however, permit the extension of the working hours, according to the class of work, but not beyond the limit of 14 hours per day. These two categories of workers are not to be employed between 10 P.M. and 4 A.M., except in special circumstances and upon special work to be determined by the competent minister. Where the operatives are employed in two or more shifts these restrictions as to night-work will not be enforced during 15 years from the date on which the law enters into force. The law, which was put into force in Sept. 1916, is recognized as a tentative piece of legislation, and its practical effect has been inconsiderable. As a result of the deliberations of the International Labour Conference at Washington, in the autumn of 1919, referred to above, the provisions of this measure were to be amended as regards working hours and employment at night.

*Minimum Wage.*—An important development in recent labour legislation outside England has been that for the fixing of statutorily enforceable minimum rates of wages, in certain cases for home-workers only.

*British Overseas Dominions.*—Minimum-wage legislation began with the *New Zealand* Act of 1894; primarily the laws had for their purpose the settlement of trade disputes involving strikes and lockouts. The legislation enacted in *Victoria* in 1896 was based upon an entirely different reason; the Victoria Wages Board law was directed against the evils of sweating, particularly of the home-workers. This type of legislation was followed by the Governments of several of the other Australian states. Up to 1921 seven out of the nine provinces of *Canada* had adopted the principle of the provision of a minimum wage for working women. The laws passed are all of very recent date, the earliest step in this direction being taken in 1917, when Alberta inserted a clause in the Factories Act of that year, establishing a flat-rate minimum wage for all employees covered by the Act, with a lower rate for apprentices. In 1918 the first minimum-wage laws for women only were passed by Manitoba and British Columbia, followed in 1919 by Quebec and Saskatchewan, and in 1920 by Nova Scotia and Ontario. In 1920, also, Alberta amended its law with special reference to women. The two remaining provinces, New Brunswick and Prince Edward Island, have as yet (1921) taken no action in the matter. The application of the law is more or less restricted in all the provinces. In five provinces the minimum-wage laws deal also with hours of labour, while in three the 48-hour week has been fixed for one or more industries under the regulations for the execution of the Acts; British Columbia recognizes this standard in all trades. In all provinces except Alberta special provision is made for handicapped workers. In *South Africa* a bill was recently introduced for the creation of local joint boards to fix minimum wages in particular trades.

*France.*—The principle of a minimum wage was adopted in France by the enactment of a law in July 1915, which provides for special boards to fix such a wage for women employed in home-work in the clothing industry.

*Switzerland.*—Minimum rates were introduced in the embroidery industry in Switzerland by a decree of the Federal Council of March 1917. In June 1919 the Federal Assembly promulgated an Act for the establishment of:—(1) a Federal Labour Department; (2) a Federal Wage Commission; (3) Federal Wage Boards. Subsequent to the passing of the measure a demand was made that it should be submitted to the Referendum, which resulted in a narrow majority for rejecting the measure.

*Norway.*—A law dated Feb. 1918 provided for the establishment of trade boards for certain industries in Norway. The provisions of the Act relative to the fixing of minimum wages applied primarily to outwork in industries engaged in the manufacture of clothing and articles of needlework generally; the application of the law may be extended to other occupations in which outworkers are employed.

*Sweden.*—A bill has been prepared by the Government in Sweden for the regulation of wages and working conditions of home-workers; the provisions include power to appoint trade boards on the English model for any occupation and district.

*Czechoslovakia.*—A law on home-work, modelled on the Austrian law of Jan. 1919, was passed by the National Assembly of Czechoslovakia at the end of 1919, and provides for the fixing of minimum wages for home-workers.

*Unemployment Insurance.*—Before the World War, little had been done outside England in the way of the compulsory insurance of the working-classes against unemployment. Schemes have for some time been established in a number of European countries whereby voluntary funds managed by trade unions and other societies, and compulsory or voluntary municipal funds providing unemployment benefit, receive subsidies from the State, provincial council, or municipality. Unemployment resulting from strikes and lockouts, and also from sickness and accident where the provision exists, is excluded. As a rule, the receipt of benefit is further dependent upon a qualifying term of membership and of local residence. A maximum duration of benefit is invariably fixed, and it is usual to impose a short "waiting time" during which no benefit can be obtained. Subsidized schemes of unemployment benefit are usually worked in conjunction with labour registries.

*Switzerland.*—The earliest experiments of this kind were made in Switzerland, where the municipality of Berne organized a fund in 1873, and other Swiss municipalities also subsequently introduced schemes. Recent developments in Switzerland are that, between Aug. 5 1918 and April 5, 1919, five decrees of an emergency character were issued by the Swiss Federal Council regulating the grant of assistance to unemployed workers. Two of these related to unemployment in private industry arising out of war conditions, the third to unemployment among workers employed by the Federal Government, the fourth to unemployment of Swiss subjects returning from abroad, while the fifth laid down conditions for the relief of all workers not covered by the preceding measures. These were repealed and revised by a single decree dated Oct. 1919, which is to be regarded as a provisional measure to be replaced ultimately by an Unemployment Insurance law. Assistance is granted both for whole and for partial unemployment, subject to the fulfilment of conditions laid down in the decree.

*France.*—In France many trade-union unemployment funds are subsidized by the State, the departments and the communes. The towns were the first to take action (as early as 1896), while the first departments acted in 1903. Under a law of April 1905, a certain credit is earmarked in the French budget for the purpose of public subsidies for unemployment benefit funds. A decree dated Oct. 1919 amended previous decrees relating to State subsidies to municipal and departmental relief funds.

*Belgium.*—Assisted provision against unemployment has been in operation in Belgium since 1901, subsidies being granted from special municipal unemployment funds to trade unions and other organizations paying unemployed benefit. Several of the provincial councils subsidize trade union and communal unemployment funds, and since 1907 the State has made small grants both towards the establishment of funds and in direct relief of unemployed members.

*Italy.*—In Italy assisted unemployment benefit schemes were introduced in a few towns. A decree of April 1916 authorized periodical subsidies to be granted or lent as a war measure to various organizations providing unemployment benefits for their members. A system of compulsory insurance against involuntary unemployment in Italy came into force on Jan. 1 1920.

*Germany.*—In Germany a voluntary unemployment fund, with a municipal subsidy, was introduced in Cologne in 1896, and certain other German municipalities also introduced schemes. Immediately after the signing of the Armistice, the German Government issued an order regulating the payment of unemployment donations. Under the order the communal authorities were required to pay out-of-work benefit to residents who were out of employment. Persons receiving out-of-work pay were required to take up work other than their usual employment, and at a distance from their place of abode, but no penalty was incurred in the event of refusal. Various abuses were soon found to exist, and amending orders have been made.

*Other European Countries.*—The "Ghent" system of assisting trade unions which maintain unemployment funds has been introduced in a number of the larger towns in *Holland* since 1906. In *Norway* a law offering State subsidies to unemployment benefit funds complying with certain conditions was passed in June 1906 and amended in July 1908, simultaneously with another law establishing labour registries. State assistance to recognized unemployment benefit societies in *Denmark* was first granted under a law dated April 1907. A law of April 1914 increased the amount of the State subsidy to such societies and made other amendments; it has been revised in certain particulars by a law dated Jan. 1920. In 1919, a royal decree in *Spain* was issued under which the State was to grant a subsidy equal to the amount of the subscriptions collected from their members by workmen's mutual unemployment benefit societies and similar institutions which have a separate organization for dealing with unemployment. The new Unemployment Insurance Act of *Austria*, dated March 1920, supersedes a temporary measure on the same subject. A change in the unemployment relief system had become necessary in order to relieve the State of its heavy financial burden, and because of the steady fall in the number of unemployed. As regards *Poland*, the official *Gazette* of Nov. 1919 announced arrangements in aid of the unemployed pending the passing of a law dealing with this subject. Able-bodied workers of either sex, in trade, commerce or transport, who, through no fault of their own, are out of work are entitled to State assistance.

*Old Age and Infirmity Insurance.*—Compulsory insurance of the working-classes against old age and infirmity has existed in some countries for a number of years, *e.g.* Germany since 1889,

France since 1910, etc. Certain other countries have also for some time applied this principle to special classes, as, for example, Austria, Hungary and Belgium to miners; while State or other public subsidies have been granted in aid of voluntary insurance or savings in France, Belgium, Denmark, Italy and Spain. The more recent developments have been as follows:—

*France.*—The French Finance Act, 1912, amended in certain respects the provisions of the law of April 1910 relating to compulsory insurance against old age and infirmity, the principal amendments being that, while in the law as originally passed the State added to the annuity purchased by the insured person £2 8s. per annum on his attaining the age of 65, the new law raised the State addition to £4 per annum, and provided for its payment from the age of 60. The Act of June 1894, in which the principle of compulsory insurance against infirmity and old age was applied to French miners, was amended in Feb. 1914, as to the State contribution, the administration of the funds, etc. Further amendments were introduced by a law passed in March 1920, the main provisions of this new law being the allocation of higher subventions towards the pensions granted to miners or their widows.

*Belgium.*—A law of June 1911 prescribed that all workpeople employed in coal-mining in Belgium must be insured in the National Superannuation Fund. A law dated May 1912 has for its object the promotion by State subsidies of recognized associations and friendly societies who grant benefits to their members suffering from illnesses of a chronic nature or from premature infirmity. It is stated that a general old age pension law is contemplated.

*Italy.*—In conformity with a law promulgated in Italy in June 1913, a Seamen's Old Age and Infirmity Fund was formed by the amalgamation of existing institutions having similar objects. As regards ships' crews, the principle of compulsory contributions was already in operation under a law of July 1861, but the obligation imposed by the later law upon shipowners introduced a new principle in Italian legislation on this subject. As from Jan. 1 1920, a scheme was introduced in Italy under which insurance against disability, resulting either from sickness or accident, and old age became obligatory (with certain specified exceptions) on (1) all Italian subjects of both sexes between the ages of 15 and 65 working for an employer in any industry, trade or profession, agriculture and the public services, or occupied in domestic service or in any private employment, and (2) foreigners working at the same occupations who, however, receive full benefits only if reciprocal treatment is granted to Italians employed in their countries.

In *Germany* an Imperial law of June 1916 reduced the age of eligibility for an old age pension from 70 to 65; laws of Dec. 1919 extended compulsory insurance against infirmity and old age to certain new classes of workpeople.

In *Holland* provision was made for the institution of national schemes for compulsory insurance against sickness, infirmity and old age by a series of three Acts dated June 1913.

In *Sweden* a law dated June 1913 introduced a national scheme of compulsory insurance against old age and infirmity.

In *Spain* provision for the creation of deferred life annuities on a contributory and State-aided basis was made by the law of Feb. 1908. This Act, however, was of a permissive nature. A royal decree was issued in March 1919, making insurance against old age compulsory for all wage-earners between the ages of 16 and 65 whose total annual income does not exceed £160.

*Sickness and Accident Insurance.*—Compulsory insurance against sickness and accident has been applied in a number of countries, for example in Germany (1883), Austria (1888), Hungary (1891), United Kingdom (1911), etc., but the range of occupations covered by the various schemes varies considerably. In a number of other countries (*e.g.* Sweden) the sick funds recognized by the State receive State subsidies. The principal developments in recent years are as follows:—

*Italy.*—Legislation in respect of compulsory accident insurance in Italy dates from 1898; a consolidated text was promulgated in Jan. 1904 embodying all the amendments up to that date. For the most part agricultural workers in Italy were excluded, but, by a decree of Aug. 1917, the principle of compulsory insurance against accidents was extended to agricultural workers generally. Reference has been made above to the general scheme for compulsory insurance against sickness or accident and old age, introduced in Italy as from the beginning of 1920.

*Switzerland.*—A new law in Switzerland on insurance against sickness and accidents, passed in June 1911, was accepted by National Referendum in Feb. 1912. The sickness insurance scheme is a system of Federal State grants to recognized sick funds conducted on a mutual basis. Generally the insurance is voluntary, but the cantonal governments may, subject to the approval of the Federal Government, (*a*) declare it obligatory either for all persons or for certain specified classes; (*b*) establish public sick funds, while having due regard to funds already in existence; and (*c*) compel the employers to see that the premiums of their employees compulsorily insured in such public funds are paid. (The power to compel the employers themselves to contribute is, however, expressly withheld from the cantons.) These powers may be delegated by the cantonal governments to their communes. Under the second part of the law provision is made for a system of compulsory insurance against accidents, which, in certain respects, involves a notable departure as compared with schemes of compulsory accident insurance hitherto enacted in other countries. In the first place, the principle of compulsion is not confined to "occupational" but also extends to "non-occupational" accidents. In the second place, the State defrays part of the premiums for insurance, and it does so not only for those coming under the compulsory provisions of the law, but also for those voluntarily insured through the National Insurance Fund which the Act sets up. Those for whom the law declares insurance against accidents, whether "occupational" or not, to be obligatory, comprise all persons employed in Switzerland for a wage or salary in factories, workshops, mines, building, and transport by land or water (including the postal service).

*Workmen's Compensation.*—Compensation for industrial accidents was established in *Germany* in 1884, in *Austria* in 1887, and *Norway* followed in 1894. The development of legislation providing for workmen's compensation for industrial accidents in Europe and throughout the world has been extremely rapid. Recent legislation (whether of compensation or insurance) recognizes the principles of compensation as distinguished from the older idea of employers' liability.

For Arbitration and Conciliation in labour disputes, *see* the article under that heading.

Bibliography.—The monthly *Labour Gazette* and the quarterly *Labour Overseas*, published by the Ministry of Labour in Great Britain, contain valuable information; there are also official publications issued by the appropriate Government Departments in other countries, notably the *Bulletins of the United States Department of Labor*, which Department has published a number of special reports on such subjects as Workmen's Compensation, Child Labour Legislation, etc. Among unofficial books, reference may be made to *A Handbook of Industrial Law* by J. H. Greenwood, and *Industrial Law* by F. Tillyard. (H. J. W.)

### United States

During the decade 1910–20 there was a remarkable development of labour legislation in the United States. Within these years were enacted, by the Federal and state Governments, statutes dealing with workmen's compensation, minimum wage, health and safety, hours of labour, vocational education and employment service. Even more significant was the creation by several states of industrial commissions with power to issue rules and regulations having the force of law and thus relieving the Legislature of a mass of technical details. It was a period also of distinct forward movement in the field of judicial interpretation, particularly with regard to the police power in the application of the principles of "public benefit" and "equal protection of the laws" as first stated in the case of *Holden* v. *Hardy* (18 Sup. Ct. 383, 1898).

*Individual Bargaining.*—Since the passage of the Thirteenth Amendment, abolishing slavery, there has been a steady development of laws designed to equalize bargaining power between employer and employee. Laws dealing with labour as debtor and as creditor have included such subjects as contract labour, the padrone system, wage exemptions, assignment of wages, time of payment, place of payment, basis of payment, medium of payment, deductions, mechanics' liens and wage preference.

*Seamen.*—Until 1914 seamen were considered in a different class from other employees and with them enforced contracts were permitted. The Seamen's Act of 1915, however, abolished arrest and imprisonment as a penalty for desertion and stipulated that it should be unlawful in any case to pay seamen wages in advance or to pay any person for the shipment of seamen when payment is deducted from seamen's wages. It permits forfeiture of one month's pay for quitting the vessel without leave after arrival at the port of delivery and before she is placed in security. The law also regulates the nature of the contract, the term of service, the payment and assignment of wages, advance payments and credits, the regulation of sailors' lodging-houses, of shipping masters, quarters on board ship, rations and other details.

*Service and Rent.*—Another important group of laws which fall under the classification of medium of payment are those dealing with company houses and labour camps. Since it is legal for an employer to require his workmen to occupy company houses and to deduct the rent from wages, there is here an opportunity for

abuse. Consequently, in 1913, New York granted to the Industrial Commission power of inspection. In three other states labour camps for certain kinds of work have been brought under supervision. A new development in the regulation of deductions from wages for the purpose of furnishing certain benefits is found in the laws of Oregon and Minnesota. The former has legalized deductions for hospital benefits on approval of the Industrial Accident Commission. The Minnesota law requires employers who make deductions for benefit funds to secure a licence for the benefit plan from the State Insurance Commission. Statutes have recently been enacted by half the states, the Philippines and the Federal Government, providing that no contract of insurance or relief-benefit shall constitute a bar to action for damages in case of an employee's injury or death, though sometimes the employer may offset against such claims benefits contributed.

Laws dealing with labour as tenant and as competitor belong, also, under individual bargaining. There has been little agricultural labour legislation except a law of Texas passed in 1915, which is the first American law designed to regulate the rents of share tenants by limiting the amount of rent which can be charged the "cropper." Among the laws protecting the labourer as competitor are the Immigration Bill of 1915 and a group of laws relating to convict labour which can be divided into three general classes: (1) prohibition of convict work which competes with free labour; (2) prohibition of convict labour in certain forms of industry; and (3) distribution of convicts among diversified lines of industry. A few states have adopted different plans.

*Legal Aid.*—Another method of protecting the individual in his bargaining relations is by legal aid and industrial courts. From New York private legal aid societies have spread throughout the larger cities of the United States. Kansas City, Mo., is the only city, however, possessing a free municipal legal aid bureau, established in 1910, while Los Angeles county, Cal., was the first to establish the office of public defender in 1913. Similar offices have been created in six other cities. California has an Act providing for the collection of wages, enforced by the Bureau of Labor Statistics. Wilful refusal to pay labour, with intent to secure a discount or to defraud, constitutes a misdemeanour. Under the N.Y. Commission Law the commission is given power to investigate claims made by employees against employers and to present the cases to the proper authorities for action. The only industrial court in the United States is in Cleveland, O., established in 1912.

*Collective Bargaining.*—Though the right of workmen to combine was secured in the United States by common consent and favourable construction without legislation earlier than by law in Great Britain, the conspiracy law has remained without being clarified. When the Sherman Anti-Trust Law was enacted in 1890 it was almost immediately held applicable to labour unions, and it was feared that it rendered all strikes, if not all labour organizations, unlawful. The Clayton Act (1914), however, declared that the anti-trust laws should not be construed to forbid the existence of labour organizations or to restrain their members from carrying out the "legitimate objects" thereof. This provision has probably eliminated the danger of the extension of the restraint-of-trade doctrine to a possible outlawing of all labour organizations, though the decision by the Supreme Court in the Duplex case (*The Duplex Printing Press Co. of Battle Creek, Mich.*, v. *International Association of Machinists*, 41 Sup. Ct., 172) has demonstrated that labour organizations in their actual practices are still within the anti-trust laws.

Most of the cases of which labour complains have been premised not on the anti-trust laws but on the common-law doctrine of conspiracy. While the legality of trade unions has not been questioned, except organizations advocating criminal syndicalism, various restrictions have been placed on efforts to make them effective. Generalizing from a large number of cases, it can be said that the strike is usually considered illegal when its purpose is primarily to injure the employer or the non-union workman and that, except where compulsory arbitration has been introduced, as in Kansas in 1920, strikes solely and directly involving the rate of pay or hours of labour are in ordinary times everywhere considered legal. But strikes to gain a closed shop, sympathetic strikes, and against non-union material, have been condemned in many jurisdictions.

California is the only state which has a settled law that all strikes are legal. The only method of preventing them is the injunction. In some cases "conspiracy to quit work" has been enjoined, and in others the union officers have been prohibited from advising or ordering the workmen to strike, or from paying strike benefits. A famous injunction of this type was secured by the Federal Government during the bituminous-coal mine dispute of 1919. Though formerly the boycott was condemned as unlawful, an effort is being made to distinguish between the primary boycott and secondary boycott, which is the boycott of a third party. At present there is great lack of uniformity among the laws. The two famous boycott cases are the Danbury Hatters' case (*Loewe* v. *Lawlor*, 35 Sup. Ct., 170, 1915), which was in the courts from 1903 to 1917, and the Duplex case (1921) already mentioned, in both of which the secondary boycott was declared illegal. Picketing laws, also, vary widely. California, which recognizes both the strike and boycott as legal, will not permit picketing. It has been condemned by the courts of six states and is held a misdemeanour in three others. Nine states hold that "peaceful" picketing is lawful. A further cause of illegality was laid down by the Supreme Court in the case of *Hitchman Coal & Coke Co.* v. *Mitchell* (1917), in which it was contended that where an employer has required all his employees to sign a contract that they will not join any labour union it is illegal to make any effort to organize them. In the Clayton Act (1914), which many believed would remove the restrictions which hamper trade unions, the most tangible gain is in the provision for jury trial in contempt cases where the offence charged is also indictable as a crime. This Act further provides that injunctions issued by the Federal courts shall not prohibit the quitting of work, the refusal to patronize, peaceful picketing or peaceful persuasion. Nor are these acts to be considered "violations of any law of the United States," whether they are done "singly or in concert." Yet those in charge of the legislation pointed out that it did not modify the law of conspiracy with regard to the substantive rights of employers and employees. When workmen combine to injure an employer or non-unionists, their illegal purpose colours all their conduct. Furthermore, it does not affect the cases in the state courts, which far outnumber those in the Federal courts.

Laws restricting employers' rights are few in number. Most of the states have laws prohibiting blacklisting, but they have been dead letters. Other statutes have been declared unconstitutional which attempted to prohibit employers from coercing workmen into surrendering their rights to belong to labour unions (*Adair* v. *United States*, 28 Sup. Ct., 277, 1908, and *Coppage* v. *Kansas*, 35 Sup. Ct., 240, 1915). The Supreme Court furthermore has held that, while it is illegal to induce a workman to join a union where he has signed an agreement not to belong (the Hitchman coal case), it is not coercion for the employer to threaten to discharge a workman unless he will renounce his union membership, as in the Coppage case.

While there have been many damage suits in connexion with labour disputes and many judgments against unions or their members, only two recent cases are important: the Danbury Hatters' case (see above) and the Arkansas coal-miners' case (*Dowd* v. *United Mine Workers*, 235 Fed., 1, 1916; *Coronado Coal* v. *United Mine Workers*, Circuit Court of Appeals, 1919). Both of these cases involved suits for triple damages under the Sherman Anti-Trust Act, and in both the cause of action antedated the passage of the Clayton Act. The decisions in these cases have established the principle that labour unions and their individual members are responsible without limit for the unlawful actions of the union officers and agents which they have in any manner authorized or sanctioned. Such antecedent authorization or subsequent approval of unlawful acts does not require to be expressed, but may be inferred from all the facts in the situation.

*Minimum Wage.*—The first minimum-wage law for women and children was passed by Massachusetts in 1912. By 1920, 13 states and Porto Rico had followed this example, and Congress had legislated for the District of Columbia. Constitutional amendments specifically allowing minimum-wage legislation were passed by California in 1914 for women and children, and by Ohio in 1912 for all classes of workers. In general the laws are very much restricted in scope and are regarded as a remedy for exceptional conditions, providing only a bare subsistence wage for those considered the most helpless class of sweated workers—women and children.

Since the purpose of minimum-wage legislation is to raise excessively low wages, the question of the standards of wage awards is the important issue. Nearly all the American laws define in general terms the principle to be followed in fixing wages, which is usually that of a living wage. For women the standard commonly used is the cost of living of the entirely self-supporting woman. Early orders were in the neighbourhood of $8 and $9 a week. In response to war-time increases, new rates were introduced which varied from $11.10 in the state of Oregon to $15.50 in the printing and engraving industry in Washington, D.C. Wisconsin set up the general rate of 22 cents an hour for experienced adults, increased to 25 cents in 1921; and Minnesota 23 cents an hour, limited to 54 hours weekly.

In connexion with fixing the minimum standard, the question of the "financial condition of the business" has arisen with regard to the continued existence of an industry, and exceptions have been made in some states for certain industries which could not stand the rate. California has best met the problem of adjusting piece rates by providing that piece rates must yield the minimum wage to two-thirds of the female employees. The employment of slow or infirm workers at lower rates is generally permitted by special licence. Practically all minimum-wage laws permit the fixing of rates for sub-standard workers. As a guide for adjusting these special rates, most American statutes contain only a provision that rates for chil-

dren and apprentices shall be suitable. To offset the tendency to substitute young girls and inexperienced workers for adults in trades requiring little skill, it has been found necessary to specify the length of apprenticeship and the proportion of apprentices allowed.

There are two methods of operation: the flat-rate law, which prescribes a legal minimum in the statute itself, and the more common type which provides for a board or commission to fix rates after proper investigation. The commissions are generally unsalaried. Their jurisdiction extends over persons covered by the law with full power of investigation. A subordinate board is usually provided for, which is representative of employers, employees and the public. It must make a report with recommendations to the commission, which the latter accepts or refers back. When the report has been accepted and a public hearing has been held, the recommendations are promulgated as orders. Provisions for a court review are customarily included. A new application of the police power is involved in the constitutionality of the minimum-wage legislation. The question was settled definitely by the Supreme Court decision in the famous Oregon case (1917) which held the law constitutional on the same ground on which laws restricting hours of labour for women and children had been sustained.

*Hours of Labour.*—Beginning with Illinois in 1903, the 8-hour standard for children under 16 has been established in 25 states and the District of Columbia, with certain exemptions in a few states. Other states have less favourable laws, especially some of the southern states, which still allow children to work legally 11 hours a day. To meet the arguments of employers who opposed restriction of hours of labour of children on the ground that it put them at a disadvantage with their competitors in neighbouring states, Congress in 1916 enacted a measure which forbade the transportation in interstate commerce of the products of factories or mines on which children between 14 and 16 had worked more than eight hours a day or more than six days a week or at night. The law was declared unconstitutional by the U.S. Supreme Court as an undue extension of the power to regulate interstate commerce. In 1919 Congress again enacted a law containing similar standards based on the taxing power, which levies a tax of 10% on the annual net profits of any concern which employs children in violation of the above standards.

By 1920 only six states, in most of which comparatively few women were employed industrially, had placed no restrictions on women's hours of work; many had limited hours to eight or nine a day; and a large number had a weekly limit of less than 60 hours. The majority of statutes fix the same daily and weekly maximum hours for all occupations covered, and generally include the principal industrial occupations for women except those in homes and agriculture. In several states the law applies only to cities within a given classification. In only a few cases, however, do the laws define the time during which the work period must fall by naming the spread of the hours allowed, by fixing opening and closing hours or by forbidding night-work. In detail the statutes vary from a 12- to an 8-hour-day minimum in 10 jurisdictions and from a 60- to a 48-hour week. About one-third of the laws permit overtime. Recently a few states have adopted a more progressive method of regulating hours by replacing the flat-rate law with statutes containing the general principle that a woman is not to be employed for any period of time dangerous to her health, safety and welfare. A commission is given power to determine, after investigation, maximum periods for different industries and even for different localities.

Though the constitutionality of the 10-hour day was established in the Oregon case (*Muller* v. *Oregon*, 28 Sup. Ct., 324, 1908), the reasonableness of the 8-hour day was still in doubt until the U.S. Supreme Court upheld the constitutionality of the California law on the same ground of public health. The laws have been attacked also on the ground of class legislation, but the courts have given little weight to this objection, asserting the freedom of the Legislature to use discretion in enlarging the scope of laws or to single out groups most in need of protection.

Statutes regarding the limitation of hours of men are more restricted in scope. In 1912 Congress required that an 8-hour clause be inserted in all contracts involving the employment of labourers or mechanics when made by the Federal Government, its territories or the District of Columbia, and extended the provision to post-office employees. On declaration of the President, violation is excusable for certain emergencies and extraordinary events. During the World War Congress empowered the President to suspend the law in case of national emergency, with pay at the rate of time-and-a-half for all work in excess of eight hours. This privilege was frequently exercised. In 1915 Federal legislation with regard to the amount of work which might be exacted took a new turn in the appropriation bills for the army and navy. Provisions were included against time studies, bonuses or cash rewards except for suggestions resulting in improvements in service. Over half of the states and many cities have 8-hour laws for employees on public works.

With regard to private employment, progress has been made mainly through collective bargaining, with a few important exceptions. In 1916 the Federal statute applying to railway employees on interstate lines and in the District of Columbia was supplemented by the Adamson law, which provides the basic 8-hour day for railway trainmen. About a dozen states regulate hours of street-railway employees to 10 or 12 a day, while Massachusetts has fixed a 9-hour day which must fall within 11 consecutive hours. A few cities, also, have regulated the hours of service on street railways. Regulation of hours in water transportation is found in the Federal Act of 1913, limiting hours of deck officers in port to 9 and at sea to 12 except in cases of emergency. The Federal Act of 1915, known as the "Seamen's Act," provides that when a vessel is in a safe harbour, 9 hours, inclusive of anchor watch, shall constitute a day's work. By Jan. 1920 the 16 states in which the mining industry is important limited hours in the various classes of mine work to 8 in one day, with special provision in a few laws for additional hours at the time of changing shifts.

With regard to regulation of hours in factories and workshops, two states, Mississippi in 1912 and Oregon in 1913, adopted the 10-hour day, with certain exceptions, for all classes of employees in certain manufacturing industries. The Oregon statute permits three hours' overtime at time-and-a-half pay, and the Mississippi Act allows 20 minutes' overtime on each of the first five days of the week and deducts this time from the 10 hours of the sixth day. In the Oregon case (*Bunting* v. *Oregon*, 37 Sup. Ct., 435, 1917) the constitutionality of the 10-hour daily limit for adult males was assured and the way was opened for much larger regulation of men's work. A small number of states also regulate the hours of employment of adult males in a few specified employments.

In spite of the considerable development of maximum hour regulation in the United States, not much attention has been paid to the question of legal rest periods. Several states have laws requiring daily rest periods; 12 states forbid certain forms of night work by women, and a few others shorten the number of hours of night work; 40 states have prohibited night work for children under 16. While more than a dozen states have made Saturday afternoon a legal holiday, practically none has made effective provision for enforcement. By 1920 six states and the Federal Government had passed laws embodying the principle of one day's rest in seven, only three of which are effective from the point of view of enforcement or number of industries included. Sunday laws have been upheld almost universally by the courts, formerly on religious grounds and in later years as a legitimate use of the police power. In the only test case of one-day's-rest-in-seven laws, the N.Y. State Court of Appeals (*People* v. *Klenck Packing Co.*, 214 N.Y., 121, 1915) sustained it as a police-power regulation. Classifications were likewise upheld as meeting modern industrial conditions.

*Unemployment.*—Private employment agencies situated in industrial and railway centres have long been a means of connecting the man with the job. The abuses of these profit-making agencies have resulted in restrictive legislation designed to prevent fraud and extortion and to ensure moral surroundings. These laws usually require owners of private employment agencies to deposit a bond with the State Department of Labor or the city authorities and to secure a licence. Twelve states prohibit the location of such offices in saloons, and several others forbid association with lodging-houses, restaurants or gambling-places. Frequently the sending of minors and women to immoral resorts is forbidden. Fees are regulated as to maximum amount. Some laws specify that all advertisements or other information must be truthful. Several states require records, but, with the exception of New York, they are rarely comprehensive enough to be valuable. There was almost unanimous testimony of investigators and public officials up to 1921 that these laws had not been successful in eradicating abuses, and there arose a widespread movement to abolish them altogether. The state of Washington took the initiative by prohibiting the collection of fees from workers by an employment agent. The U.S. Supreme Court, however, held the law unconstitutional as "arbitrary" and "oppressive," an undue restriction on the liberty of the appellants, and therefore a violation of the Fourteenth Amendment. In 1919 the Wisconsin Legislature gave the State Industrial Commission discretionary power to refuse licences to private employment agencies if the public bureau in the district is sufficient to supply the needs.

At the time of the entrance of the United States into the World War there were between 80 and 90 public employment exchanges maintained by 23 states and more than a dozen cities. In 1920 44 states and the District of Columbia were coöperating with the U.S. Employment Service. The older laws which create only a state employment office and make no

provision for local branches have been practically a dead letter. The more recent legislation, however, which can be exemplified by the N.Y. statute of 1914, has been successful. It establishes a bureau of employment in the State Department of Labor under the immediate charge of a director who must be under civil service rules. The industrial commission is given power to establish such free local offices as it deems necessary. The activities of the local bureaus are coördinated by a labour market bulletin and the interchange of lists of vacancies. Partial recognition of the policy of joint control is given in the appointment by the Commissioner of Labor of a representative committee of employers and employees. Other clauses provide for registration, special regulations for children, and various details. The most controversial point in the administration of a bureau is the policy to be pursued in the case of a strike or lock-out. The first laws forbidding applications under those conditions were declared illegal. Since then the problem has been dealt with by some form of publicity clause requiring the exhibition at the exchanges of statements in regard to trade disputes. But state offices cannot organize the labour market. The war-time demands of labour emphasized the weaknesses of the state systems and led to the development of new administrative machinery, the U.S. Employment Service (*see* LABOUR SUPPLY AND REGULATION).

In regard to the progressive measures dealing with the systematic distribution of public work, little of value has been accomplished, though a number of cities have inaugurated plans to meet temporary emergencies and have made definite arrangements for reserve work. Pennsylvania is the only state which has established a permanent fund to be used for public work during slack seasons. The question of the prevention of unemployment is only just beginning to be recognized. The Illinois and Pennsylvania laws of 1915 instruct the administration authorities to take steps toward the regularization of employment, but nothing has been accomplished. A more definite inducement to the regularization of employment is found in the laws under consideration by several legislatures which require the employers to take out insurance against the unemployment of their employees and to provide compensation to the workers during the unemployed periods.

*Safety and Health.*—Legislative activities for the control of industrial accidents and occupational diseases have developed along four main lines: reporting, prohibition, regulation and compensation or insurance. Though the early laws did not bring satisfactory results, accident-reporting laws have proved useful as a guide for inspection, safeguarding and advanced legislation, and have continued to spread to new states and to new branches of industry. Laws relating to the reporting of occupational disease are of more recent origin. California in 1911 was the first state to pass such a law, and within five years 16 states had enacted similar measures. The latest tendency is to include within the laws "any ailment or disease contracted as a result of the nature of the patient's employment" instead of limiting them to certain diseases.

The prohibitive method has been applied to the exclusion of certain classes from employment and to the outlawry of dangerous substances and instruments. As a result of continuous agitation, by 1920 the 14-year minimum-age limit had been established for general factory work in all except five states and by the Federal Government, while several states have raised the limit to 16 years and in some instances to 18 years and even 21 for certain more hazardous and morally dangerous occupations. The street-trade laws are still far from adequate. In 1920 only two states had the same age limit, 14 years, for street trades as for other employments, and only about half of the states had any regulations at all. In regard to physical requirements no standards have been fixed, but 12 states require a physical examination of all children granted permits. The New York law makes further provision also for a corps of medical examiners under the Department of Labor to examine any children in any industry and to recommend the withdrawal of the employment certificate. A number of states modify the age requirements by forbidding the employment of children who do not come up to certain standards of knowledge. These vary from a mere literacy requirement in any language to graduation from the eighth grade. The principal agencies for the enforcement of child labour laws are the school authorities, the boards of health, and, in some states, special child-labour inspectors. Probation officers and child-welfare agencies may sometimes aid. The issuance of certificates is usually in the hands of the local school authorities, though in New York it is in the control of the Board of Health and in Wisconsin of the State Industrial Commission.

The exclusion of women from certain occupations has not been extensively developed in America. Work in mines is forbidden in most of the mining states, and work in saloons (except by members of the family) in 15 states. In addition there are a few scattered provisions in regard to the cleaning of moving machinery, work requiring constant standing, operation of emery or other polishing wheels and coremaking in foundries. Child-birth protection did not receive consideration until 1911. Since then five states have passed laws forbidding employment of any women in manufacturing, mechanical or mercantile establishments within two weeks before and four weeks after child-birth. Legal requirements for the exclusion of men from dangerous occupations are limited to certain classes of individuals. Four states require certain physical qualifications for work in compressed air; the "lead laws" require monthly examinations; absence of contagious disease is required in bakeshops; and freedom from colour-blindness of railway employees is mentioned in a few states. Technical qualifications required for licensing men to carry on certain trades are far more numerous. In regard to the prohibition of substances and instruments, there are two laws. In 1912 Congress placed a prohibitory tax of 2 cents per 100 on matches containing white sulphur and prohibited their import or export. This was the first time that the power of internal revenue taxation had been exercised for the protection of the health of the workers. There is also a regulation in Massachusetts forbidding the use of certain shuttles.

The need of standards, drafted and enforced by public authority, has led to the development of codes dealing with factories and workshops, mines and tunnels and transportation. The factory codes include regulations which deal with the construction and use of machinery, steam boilers and elevators, stationary equipment, etc., protection against fire, lighting, heating and ventilation, seats, toilets and dressing-rooms, protection from infectious disease, and tenement-house manufacture. In connexion with mines and tunnels the regulations treat mainly of accident dangers, though the health hazard has been given some consideration. Compressed-air illness (or caisson disease) is the industrial hazard which has been brought into prominence by the increasing construction of tunnels, subways, bridges and skyscrapers. Three states have attempted to control the disease by legislation, and several states have issued orders which include periodic physical examination, a sliding scale of working hours (decreasing as the pressure increases), and a period of gradual decompression. More than a 50-lb. pressure is forbidden.

In regard to navigation the Federal Seamen's Act of 1915 provides for a substantial increase of the size of crews, for a certain percentage of able seamen, for certified life-boat men and for a given number of properly constructed life-boats. Laws dealing with railways and street cars can be divided into two groups: those designed to protect the employee and those designed to protect the public. In the case of the first group, continued progress has been made since 1910 by giving the Interstate Commerce Commission power to designate standards of equipment and to investigate accidents. The latest development of laws for the protection of travellers are the full-crew laws, applying to both passenger and freight service. These have been upheld by the courts on the ground of public safety. Their enforcement is usually entrusted to state railway and public utility commissions with delegated power to work out details.

*Social Insurance.*—The first accident compensation law of general application was passed by New York in 1910. This statute was declared unconstitutional, but an amendment to the state constitution made possible the enactment of a compulsory law in 1914. Other states followed, and by 1919 compensation laws had been passed by 42 states in addition to Alaska, Hawaii and Porto Rico. The Federal law of 1908 was repealed in favour of the Act of 1916, which covers all civilian employees of the Federal Government. Early laws had been declared unconstitutional on the ground that to require an employer to pay damages for an accident for which he was not to blame was taking property without due process of law; that both employer and employee were deprived of the right of trial by jury and that the employer was charged with liability without fault. In 1917, however, the constitutionality of the chief types of compensation was affirmed by the U.S. Supreme Court in three far-reaching decisions (*New York Central R.R. Co.* v. *White*, 37 Sup. Ct., 247, 1917; *Hawkins* v. *Bleakly*, 37 Sup. Ct., 255, 1917; *Mountain Timber Co.* v. *Washington*, 37 Sup. Ct., 260, 1917). The Court ruled that the enactment of laws providing compensation for industrial accidents tended to promote the public welfare and were, therefore, within the scope of the police power. It upheld laws requiring compulsory insurance in state funds on the ground of a "fair and reasonable exercise of governmental power." Because of the adverse decision of the first N.Y. law, most American compensation acts have been made elective according to the

following device. The employer is given the choice of accepting the law or of operating under the liability laws with the old liability defences—fellow-servant's fault, contributory negligence, and assumption of risk—abrogated or greatly modified.

The laws vary greatly in detail. Though a compensation system should apply to all employments and cover all industries, nine main groups are usually excluded (employees in non-hazardous occupations, agricultural labour, domestic servants, employees in interstate commerce, workmen in establishments employing fewer than a given number of persons, public employees, casual labourers, those not engaged in the regular course of the employer's business and those in employments not conducted for gain). Laws of four states and the Federal statute have been amended to include occupational diseases. Medical attendance is usually provided for, though it varies in time limit from two weeks to 90 days and in amount from $50 to $600. An increasing number of states, however, are giving their administrative boards power to use their discretion to increase the period and the amount. The waiting period during which no compensation is paid varies from no waiting period at all to 14 days. The compensation rates range for total disability from 65% of the wage (within certain limits) to 50% with time limitations varying from 208 weeks to 550 weeks, and money limitations from $4,000 to $6,000. Compensation for partial disability is usually based on a fixed schedule of a certain number of weeks' benefit for each specific dismemberment. In a few states it is reckoned as a proportion of the loss of earning power. Most states grant funeral benefits. Few are liberal in prescribing compensation to be paid dependents, which is either a specified monthly amount or a maximum amount ranging from $3,000 to $6,000. In recent years the question of rehabilitation has been given considerable attention, and by 1920 11 states had made provision for the aid of industrial cripples. In that year also, Congress passed a bill to grant Federal aid on the basis of dollar for dollar to states undertaking to rehabilitate industrial cripples. Administration of the laws is usually by a central board with general powers of enforcing the law, though a few states still leave the questions to be settled by the courts. In order to protect both the employer and employee most states compel employers to insure their risks unless they can give satisfactory evidence that they are able to bear serious losses due to accident. Besides this so-called self-insurance, three methods have been developed: insurance in a state fund, which has been established in half of the states; insurance in a stock company and insurance in a mutual or inter-insurance company.

Other forms of social insurance have not received much attention in the United States. Several bills have been introduced in state legislatures on health insurance, unemployment compensation and old-age insurance, but as yet only a few have been enacted for special classes. In 1920 a law establishing compulsory contributory old-age and invalidity insurance for the Federal Government's employees in the classified civil service was enacted. Pensions are provided by state and municipal governments for certain groups of employees, such as policemen, firemen and teachers, and by the Federal Government for soldiers and sailors.

Besides the system of life insurance administered by the savings banks under supervision in Massachusetts, the customary form of protection of widows and orphans is by means of mothers' or widows' pensions paid to certain classes of mothers with dependent children. In the years from 1911 to 1919 39 states, Alaska and Hawaii had enacted such laws. The legislation uniformly provides for straight pensions on condition that the mother is capable of providing a proper home for the child.

*Vocational Education.*—The Federal Act for the promotion of vocational education in the fields of agriculture, trade, home economics and industry was passed in 1917, and since then there has been a rapid expansion of this form of labour legislation. The law popularly known as the Smith-Hughes Act is based on four ideas, namely: that vocational education is essential to national welfare; that Federal funds are necessary in order to equalize the burden of carrying on the work among the states; that since the Federal Government is vitally interested in the success of vocational education it should, so to speak, purchase a degree of participation in that work; and that only by such Federal and state relationships can proper standards be set up. According to the statute, the Federal Government does not undertake the organization or immediate direction of vocational training in the several states, but agrees to make substantial yearly contributions to its support. The Federal grants are conditional and their acceptance imposes on the state specific obligations. By 1919 every state had accepted the Act.

The Federal law is administered by the Federal Board for Vocational Education, appointed by the President, which consists of the Secretary of Agriculture, the Secretary of Commerce, the Secretary of Labor and the Commissioner of Education, together with three citizens who represent the manufacturing, commercial, agricultural and labour interests. A staff, composed of a director and four assistant directors, is chosen by the board. The state board, which must be created on acceptance of the Act, is the connecting link between the Federal board and the states. Each year Congress appropriates a given sum, according to a graduated scale increasing up to 1926, when the maximum, $7,367,000, will be reached, which will then become the annual appropriation. Money is granted to the states only on condition that it is matched by an equal amount appropriated for the same purpose (salaries and maintenance of teacher training) by the state, local community or both. In addition state grants must be made for buildings and equipment.

The law deals only with general standards and policies. Each state draws up its own plan of education to meet its own needs, which it submits to the Federal board for approval. The guiding principle laid down is that the education furnished must be under public supervision and control and must be designated to train persons for useful, common, wage-earning employments. It applies to boys and girls of 14 years and over who desire preparation as trained wage-earners, or who, having already taken up a wage-earning employment, seek greater efficiency; and to wage-earners, established in their trade or occupation, who wish to advance to positions of responsibility. No academic studies are to be supported out of the Act. In 1920 3,155 schools were aided.

Prior to the enactment of the Federal law two states had provided for compulsory part-time school attendance. Since then 16 other states have enacted similar measures, and several others have passed permissive mandatory statutes authorizing local districts to establish such schools. The laws vary in detail. The most common ages of required attendance are 14 to 18 years; hours required per week range from four to eight; the length of the school-year varies from 144 hours to the same as that of the common schools. Though the work in the United States is still new, these laws represent one of the most important developments in the labour and educational fields.

Wisconsin has gone one step further in her apprenticeship law, passed in 1911 and revised in 1915. It provides that all minors who receive instruction in a trade as a part of their consideration of employment shall be indentured. All such indentures must be approved by the Industrial Commission and can be enforced against both employer and apprentice. During the first two years of apprenticeship the apprentice must attend a part-time school for five hours each week to receive instruction in the theory of the trade, to supplement shop training. The employer is required to pay for such instruction at the same rate per hour as for service. The Industrial Commission has broad powers to investigate, determine and fix classifications, issue rules and regulations and to enforce the same with penalties. It is the duty of all public-school officers and teachers to coöperate with the commission and employers to furnish the instruction designated. Since all trades must be standardized and different schedules of training outlined, trade committees of employers and journeymen are organized to fix the length of apprenticeship, wages and the various branches to be taught. There is, also, another advisory board composed of employers, employees and educators which is consulted on questions of changes in the general policy governing apprenticeship.

*Administration of Labour Laws.*—The development of industrial commissions is the most significant fact in the recent history of the administration of labour legislation. The growing complexity of conditions has made it practically impossible to embody sufficient details within laws or to make them flexible enough to provide for constant changes. To meet the varying needs and to set the different standards required, the legislatures at first established special commissions, such as the minimum-wage commissions. This policy, however, led to duplication of functions and conflict of authority, and in their place six states have created industrial commissions which have general administrative control over the branches of labour legislation dealing with minimum wage, hours of labour, public and private employment offices, workmen's compensation and other related laws. Under these statutes the Legislature lays down the general state policy of reasonable standards and leaves to the commission the intricate details of investigation. It is given authority to make the findings necessary for the effective application of the standard to each case or class of cases. It can make classifications and issue different rules for different conditions and can change its rules when conditions change or when it discovers new and more effective remedies. These rulings of the commission are known as orders and are *prima facie* lawful.

This substitution of administrative rules for legislative details has made it possible to apply the principle of representation of interests. In Wisconsin, for example, joint committees representative of capital and labour are appointed by the employers and workers to serve in an advisory capacity. Generally these

committees actually draw up the rules, assisted by the staff of the industrial commission, after an exhaustive coöperative investigation. In some cases, as, for instance, in the determination of the minimum wage, consultation with joint committees is made mandatory. These committees form, in fact, an inferior industrial legislature, composed of leaders and representatives of both interests, who are continually in session under state supervision and working on those details of administration which, after all, are the actual substance of such legislation as is enforced.

**LABOUR MINISTRY AND DEPARTMENT OF LABOUR.**—One of the outward signs of the intensified governmental interest in labour has been the establishment in 1913 of a Department of Labor in the United States, and in 1917 of a Ministry of Labour in Great Britain.

UNITED KINGDOM.—The demand for the creation in the United Kingdom of a separate Ministry of Labour had been since 1904 a stock subject of discussion at the annual Trade Union Congress, and resolutions in favour of it had been introduced in various years up to 1916. Meanwhile, the attention of employers had been principally directed to the advocacy of a Ministry of Commerce which was to be a development of the Board of Trade. Employers had not contemplated in general a separate ministry for the labour side of the commercial problem. The general policy of the Government had been to leave to each department of State that portion of the labour problem which naturally was associated with its main functions. In so far as there was any department which was primarily charged with labour problems, that department was the Home Office, as having charge of factory legislation, though the Board of Trade had also a considerable share of the responsibility for handling labour questions, and through its "Commercial, Labour and Statistical Department" (*see* 27.127) was being given continually larger association with them. Thus the Labour Department of the Board of Trade was made responsible in turn for the administration of the Labour Exchanges Act (1908), the first Trade Boards Act (1909), and Part II. of the Insurance Act of 1911, which dealt with unemployment insurance; and this Department dealt with the work of conciliation in labour disputes until the establishment of the separate department of the Chief Industrial Commissioner in 1911. Other departments concerned were:—the Local Government Board, as responsible for the administration of the poor law; the Board of Education; and the Board of Agriculture and Fisheries, in so far as any labour questions affecting agriculture arose. Finally, there was the position of the State as a direct employer of labour—both of clerical and semi-clerical labour in the Civil Service and the Post Office, and of industrial labour in Woolwich Arsenal and the dockyards. The general labour policy in this respect was under the financial control of the Treasury; the actual handling of the labour problems affecting the postal service was dealt with by the Post Office, those affecting Woolwich Arsenal and Enfield by the War Office, those affecting the dockyards by the Admiralty. The only general measure of coördination was given by the Fair Wages Advisory Committee, which considered from time to time what were in fact the fair wages in terms of the House of Commons resolution requiring that Government contractors should pay fair wages, and which instructed the contracting departments as to the wages that they should require their contractors to pay.

With the outbreak of the World War in 1914 labour problems immediately assumed a new importance, since the paramount question was the control of man-power. It was natural in these circumstances that resort should be had by the Government primarily to the Board of Trade, upon which the handling of labour problems had increasingly centred in the years immediately preceding the war. Thus it was to the Labour Exchanges Department of the Board of Trade that the Government looked for the supply of labour for mobilization and for the grouping of labour which was required for the munitions programme. In the same way the Government looked to the Chief Industrial Commissioner for advice and guidance upon the policy to be adopted in respect of general labour problems such as trade disputes and the need for increasing production. But, as these problems assumed an ever-increasing importance, it began to be obvious that possible conflict, which might arise from separate policies carried out by the War Office, Admiralty and Board of Trade, might lead to grave consequences. More and more it was felt that some department, charged at any rate with the labour war problems, should be established, and effect was given to this view by the establishment of the Labour Department of the Ministry of Munitions in Aug. 1915. That department was in the first place largely staffed by officers lent by the Board of Trade, and from the outset discharged the dual function of war labour supply and regulation.

At the same time, it was laid down that the duty of holding the scales between the two sides in industry, *i.e.* the duties of conciliation and arbitration, must remain separate from the Ministry of Munitions, which was in itself an employing department. Thus the arbitration tribunal, known as the Committee on Production, which had grown out of the Chief Industrial Commissioner's Department, remained with the Board of Trade.

At first the Labour Department of the Ministry of Munitions had charge of labour problems affecting both the Admiralty and the War Office. But, even so, there were many labour problems of the first importance for which this department was not responsible. The control of the railways remained with the Railway Department of the Board of Trade, and similarly the control of mines with the Home Office. But the problems arising on mines and railways were of a general character affecting the whole labour situation. Moreover, while technically the Ministry of Munitions had responsibility over the labour policy of the Admiralty, it was hardly to be expected that one department of State would find itself able to take instructions from another which, in labour matters, was in fact a competitor. In consequence, although the Ministry of Munitions had achieved a certain measure of centralization and coördination, it was increasingly felt that some central department, not itself directly an employer of labour, should be available for giving general advice to the Government.

The first attempt to secure this was the creation during 1916 of the Department of the Chief Labour Adviser to the Government. It was the intention that Mr. Arthur Henderson, M.P., who was appointed to this post, should in a sense fulfil the function of guiding the labour policy of all departments and advising the Cabinet generally on labour affairs. The difficulty, however, was that Mr. Henderson had no direct authority over the employing departments, and was not in direct relation with the Committee on Production, which remained attached to the Board of Trade. In the result, therefore, though Mr. Henderson's advice was always available, the office of Chief Labour Adviser was not found to fulfil the requirements of the situation.

*Ministry of Labour, 1917.*—One of the first steps of the first Lloyd George Government was to establish early in 1917 a new Ministry of Labour. It was constituted under the powers given by the New Ministers and Secretaries Act, 1916. The Act did not itself invest the Minister of Labour with any specific powers except that it provided that the labour functions of any other department of State could be transferred to him by Order in Council. The Ministry started its official existence with the responsibility for the Chief Industrial Commissioner's Department, the administration of the Trade Boards Acts, and of the employment exchanges. Shortly afterwards there was added to these functions the responsibility for labour statistics. It happened, however, that simultaneously with the creation of the Ministry of Labour the Department of the Director-General of National Service also came into existence, and the question of the control of labour exchanges at once created complications. Every effort was made to bring the two Departments into the closest possible touch, but since the Admiralty and the Ministry

of Munitions, as well as the Board of Agriculture, were using the exchanges, it was difficult to effect a satisfactory coördination. During the war period the Ministry of Labour exercised the two functions of advising on general labour policy and of preparing for the post-war situation. So far as the first part of the Ministry's functions was concerned, great difficulties were experienced in effecting control. Not only had the Ministry of Munitions and the Admiralty established large and powerful Labour Departments, but as time went on separate Labour Departments under the Coal Controller of the Board of Trade and the Board of Agriculture and Fisheries were established, to be followed by an attempt to set up a separate department for the Air Ministry.

Each of these departments had its own special and pressing problems. Each was constantly driven by the pressure of circumstances to give decisions, without previous reference to the Ministry of Labour, which seriously affected Government policy as a whole. Thus the Ministry of Munitions made wages orders affecting women and men, which were not necessarily consistent with the awards given by the Committee on Production.

The Coal Controller arrived at a settlement with the miners which had the most unexpected repercussions on every class of miner engaged in non-ferrous mining. Here again there was no previous consultation with the Ministry of Labour. The Board of Agriculture pursued its own policy, and, under the Corn Production Act of 1917, set up Agricultural Wages Boards, which departed from the principles guiding the Trade Boards controlled by the Ministry of Labour in that the agricultural boards were entirely independent of any Government control. Moreover, the Board of Trade in its negotiations with the railway men was often too pressed by circumstances to be able to consult with the Ministry of Labour.

All these difficulties were almost inevitable with a new department created in the middle of the World War—a stranger among long-established departments. But in spite of these handicaps the existence of a single department which had no direct interest in production and could view labour problems from a general point of view was undoubtedly of great service. Of still greater service was the work performed by the Ministry of Labour during the war in preparing for peace conditions. The Ministry of Labour was responsible for drawing up, in conjunction with the War Office, the elaborate schemes for the demobilization of the forces, and was responsible with the Ministry of Reconstruction for drawing up the schemes for demobilization of civilian war workers. In addition the Ministry of Labour, by the creation of Whitley Councils, the extension of the Trade Boards Act and the proposals with regard to the control of wages after the war, was laying the post-war foundations.

Immediately upon the declaration of the Armistice at the end of 1918, it was decided to transfer to the Ministry of Labour the labour departments of the Admiralty and Ministry of Munitions. There was set up, to meet the special emergency created by demobilization, a new department of the Ministry of Labour under a Controller-General of Demobilization and Resettlement. The Ministry was then, for the immediate post-Armistice period, divided into two broad halves. The first half dealt with industrial conditions, and was responsible for the administration of the Wages (Temporary Regulation) Act, conciliation, the administration of the Trade Boards Acts, watching the progress of Joint Industrial Councils, and for the general industrial policy of the Government. This half of the Ministry of Labour was placed under the Permanent Secretary.

The second half of the Ministry of Labour under the post-Armistice scheme, under the Controller-General, divided itself into permanent and temporary departments. The permanent department was the machinery of the employment exchanges. Side by side with this permanent machine there were three temporary departments:—

(*a*) The Training Department, which was set up to provide training for disabled men and for certain classes of women.

(*b*) The Appointments Department, which dealt with the placing and training of officers and men of similar educational qualifications.

(*c*) The Civil Liabilities Department, which provided resettlement grants for ex-service men under certain conditions.[1]

[1] A separate department for Ireland, under a secretary responsible to the Permanent Secretary, was established early in 1919.

With the enormous accession of work that the Armistice threw upon the Ministry of Labour it was not possible to attempt to plan out the permanent foundations of the department. Consequently at this stage, so far from all questions of labour policy being transferred to the Ministry of Labour, at least one new department dealing with labour matters was set up in the Mines Department of the Board of Trade. Moreover, the Board of Agriculture retained its complete control of questions of agricultural labour, though it was rapidly becoming apparent that these questions could not with advantage be considered separately from the general labour questions before the Ministry of Labour.

The difficulties of this grouping of the situation were further accentuated by the increasing importance of the handling of international labour problems. With the establishment, under the Versailles Treaty, of an International Labour Office, it became of even greater importance that there should be one department, speaking for the Government as a whole, on labour topics. It was plain that action taken by the International Labour Office would profoundly affect labour problems in the United Kingdom, but, owing to the heavy burden cast upon the Ministry of Labour, it was not possible definitely to associate the department with the governing body of the International Labour Office.

*Post-war Reconstruction.*—When the first rush of Armistice work was over, an attempt was made to lay down to some extent the permanent lines upon which the Ministry of Labour was to develop. It was recognized that in any event it would be necessary to proceed slowly with the complete centralization in one department of all labour matters, but it was felt that an organization must be devised which would be ultimately capable of taking such a position if this were finally decided upon. Speaking generally, the functions of a Ministry of Labour would be:—

(*a*) To advise the Cabinet of the day generally on labour policy.

(*b*) To administer the Government's labour code; by which is meant, to be responsible for all Acts of Parliament directly affecting the relations of employers and employed.

(*c*) To act for the Government in respect of international labour problems as a sort of foreign office for labour.

The situation did not permit of the discontinuance of the temporary departments. Apart from these, the Ministry is divided into three main administrative departments with certain common service departments.

The administrative departments are:—

(*a*) *The Industrial Relations Department*, which deals with arbitration and conciliation relations with the industrial courts set up under the Industrial Courts Act, 1919, the administration of Joint Industrial Councils, the Fair Wages Clause and hours of labour.

(*b*) *The General Department*, concerned with administration of the Trade Board Acts, intelligence and statistics, and parliamentary and international work.

(*c*) *The Employment and Insurance Department*, responsible for administration of the Unemployment Insurance Acts, control of employment exchanges, employment of ex-service men, and juvenile employment.

The Common Services departments include (1) Finance, (2) Establishment, and (3) Solicitor's Department.

It will be observed that this arrangement tends to divide the work of the departments into two main groups—conditions and employment, with a central group which, for the purpose of convenience, has taken part of the work of conditions of employment in the administration of trade boards. Considerable tracts of work, however, which would be covered by the general basis of the department suggested above, are not included. Thus the responsibility for the administration of the Factory Acts and the Workmen's Compensation Acts remains with the Home Office, as does the responsibility for the labour policy in respect of merchant seamen with the Board of Trade, for railwaymen with the Ministry of Transport and for agricultural labour with the Ministry of Agriculture. Moreover, though the existing arrangements provide for the administration of unemployment insurance by the Ministry of Labour, this is the only degree in which the department has responsibility for the treatment of the able-bodied unemployed. So far as international labour is concerned, the position has been made definite by the establishment of an interdepartmental committee under the chairmanship of the Minister of Labour, which is responsible to the Cabinet for handling international labour problems.

(H. Wf.)

UNITED STATES.—The Department of Labor was created by Act of Congress on March 4 1913. Its chief official, the Secretary of Labor, is a member of the President's Cabinet. He is "charged with the duty of fostering, promoting and developing the welfare of the wage-earners of the United States, improving their working conditions and advancing their opportunities for profitable employment." He is authorized to direct the

collection of statistics concerning the conditions of labour, its products, and their distribution, and may call upon the other governmental departments for the data they possess. He is also empowered to act as mediator in labour disputes and to appoint commissioners of conciliation, whenever he deems it desirable for promoting industrial peace. There is also an assistant secretary and a solicitor of the Department of Labor, the latter acting as legal adviser to the Secretary and to the heads of the various bureaus.

The four original bureaus comprised (1) the bureau of labour statistics, charged with gathering and diffusing information about labour, especially its relations with capital, hours of labour, earnings of labourers, and means of improving their conditions; (2) the bureau of immigration, charged with administering the immigration laws, including the Chinese-exclusion laws; (3) the naturalization bureau, for administering the naturalization laws; and (4) the children's bureau, charged with investigating and reporting upon all matters pertaining to children and child life among all classes of people, including infant mortality, maternal mortality, juvenile delinquency and diseases of children.

The exigencies of the World War led to the formation (1918) of a woman-in-industry service, or women's bureau, to safeguard the interests of the large number of women who replaced men withdrawn for war service. In the same year the U.S. employment service, formerly a part of the immigration bureau, was made a separate bureau and became the medium for recruiting unskilled labour for war industries, excepting farms and railways. Between Jan. 1 1918 and June 30 1919 employment was secured for 4,055,159 persons, and after the Armistice many discharged soldiers were placed in positions. As a temporary war emergency measure there were created also (1) a bureau of industrial housing and transportation for labourers engaged on Government contracts; (2) an information and education service for creating, through publicity, a spirit of coöperation and mutual understanding between labour and capital; and (3) a national war labour board, for settling labour disputes and ensuring uninterrupted production of the essentials for war.

The Department of Labor is the outgrowth of public agitation extending over a long period. In 1884 a Bureau of Labor was created under the jurisdiction of the Department of the Interior. In 1888 this bureau was converted into an independent Department of Labor, headed by a commissioner who, however, was not admitted to the President's Cabinet. In 1903, after the creation of the Department of Commerce and Labor, the old Department of Labor, thereafter known as the Bureau of Labor, was placed under its jurisdiction. For 10 years the interests of both labour and capital were entrusted to the same executive department. This proved unsatisfactory because these interests were often in conflict. Finally, in 1913, the Department of Commerce and Labor was changed to the Department of Commerce, and there was created a separate Department of Labor especially entrusted with the problems that concerned the welfare of the wage-earners.

**LABOUR SUPPLY AND REGULATION.**—During the World War the question of national "man-power" came to the front as never before. In a war engaging the whole resources of a nation its man-power must be distributed to meet four paramount obligations: (1) The maintenance at requisite strength of the fighting forces; (2) the supply to the forces of the necessary men for carrying on war; (3) the supply of the necessities of life for the civilian population, and (4) the maintenance of ordinary commercial work to the fullest possible extent in order to maintain financial credit. It is the business of Government to see that as far as possible the appropriate categories of men are drafted into each class. If there is a shortage of the gross supply it becomes a duty not merely to attempt to increase the total from new sources, but to regulate the existing supply in such a way as to increase its productivity.

The problem of "man-power" in war-time is obviously different from the outset in countries which begin a war with universal compulsory service and those which begin a war on the basis of voluntaryism. In the case of countries such as France and Germany, the approximate size of the fighting forces was known in advance and this fact, combined with universal compulsory service, at any rate canalized the problem. In the United Kingdom of Great Britain and Ireland, where the fighting forces were expanded sevenfold, and where there was no compulsion at the outset and never universal compulsion, the problem was of a completely different order.

### I. United Kingdom

The history of labour supply and regulation in the United Kingdom during the World War is the history of how a system had to be improvised to meet the ever-shifting demands of the four predominant national needs. The problem for those concerned with the handling of labour throughout was to attempt, with an inadequate supply, to meet each of the four demands to the widest possible extent.

The first necessity in point of time was the recruitment of fighting forces on a scale hitherto unimagined. No attempt was made to limit the area of recruitment, nor would it have been possible in the early days to impose any such check. If limits had been imposed upon the patriotic enthusiasm which brought millions to the colours, serious obstacles would have been put in the way of building up the immense armies that were ultimately achieved; but the very impetus of recruitment of itself created in an acute degree the shortage of man-power, and accentuated it by reason of the fact that men were drawn largely from the very trades upon which the fighting forces depended for munitions.

To a certain extent the account of labour regulation and supply is an account of the long and difficult attempt to repair the ravages in the industrial ranks created by indiscriminate recruiting. The account of the handling of the problem may be approached from three points of view—the first negative, and the latter two positive:—

(A)—The negative, which consisted in the limitation of recruitment.

(B)—The stage of increase of labour supply, (1) by drawing on to vital work workers engaged on less vital work, (2) by bringing back from the forces skilled men to assist in the production of munitions, (3) by getting workers from new sources.

(C)—The intensive use of the available supplies of labour by its regulation, (1) by increasing mobility, (2) by preventing wastage, (3) by removal of trade-union restrictions, including ultimately dilution, (4) by obtaining full value for hours worked (under which is included the prevention of strikes and lockouts, the regulation of hours of employment, the provision of workshop discipline, and the provision of satisfactory working conditions), (5) by the handling of wages problems.

(A) The Limitation of Recruitment.—So far were the Government and the country from realizing the probability that excessive recruitment might lead to grave shortage of man-power, with the result that instead of widespread unemployment there would be practically no unemployment whatever of able-bodied persons, that the first steps in the handling of the labour problem by the Government and by the engineering trades respectively were as follows:—(*a*) The Government set up in the early days of Aug. 1914 a strong Cabinet committee for the prevention and relief of distress. (*b*) On Aug. 19 the executives of the Engineering Employers' Federation and the Amalgamated Society of Engineers met to discuss ways and means whereby the unemployment contingent on the national crisis might be minimized. (*c*) The attitude of the general business community was crystallized in the phrase "business as usual."

This early point of view was rapidly modified. As early as the end of Sept. 1914 it began to appear that the rate of unemployment was far from high; and from Oct. onwards, to the shell conference of Dec. 21, the outstanding feature of the labour situation which began to emerge was the grave shortage of skilled engineering labour, threatening to make impossible the vitally needed expansion of production. Nor, when the figures of recruitment are examined, is this result surprising. By Oct. 1914 the group in the engineering trades had lost by enlistment 12·2% of their pre-war male workers. This percentage had risen by July 1915 to 19·5.[1] Against this loss must be offset the large proportion of new entrants into these trades, but these entrants never filled the gap thus created and would have been inadequate

[1] Board of Trade report on the state of employment in the United Kingdom in July 1915, Part I, page 3.

if the demand on this group had remained at the pre-war standard, whereas in effect it was increased out of knowledge.

The situation accordingly was grave. The shortage of munitions was causing acute apprehension, and early in 1915 it had attracted general public attention. The first step, therefore, taken to deal with the matter was to provide some form of protection from recruiting for men engaged on munitions production. As early as Sept. 8 1914 Messrs. Vickers had suggested the possibility of the issue of a badge which should protect men from the recruiting officer on the one hand, and from irresponsible persecution on the ground of shirking on the other; but throughout 1914 nothing on a systematic or even considerable basis had been attempted in this direction.

In Jan. and Feb., however, the matter was seriously taken in hand by the War Office, and a special branch was set up to deal with the "badging" of indispensable workmen engaged on munitions. A scheme was brought into operation in March 1915, under which contractors were classified according to the importance and urgency of their work. Similar action was taken by the Admiralty, and in May of that year instructions were issued to recruiting officers that men in certain categories were not to be accepted for enlistment, but this action was in itself almost nugatory. The patriotic impulse to join up among the younger men was still too strong to admit of artificial restriction, but the lists were not really drawn up on any scientific basis. In fact, they were directed rather to protect the manufacturers of the finished product, *i.e.* shells, guns and ships, while making no real endeavour to cover the sources of supply, *e.g.* machine tools. The action taken by the Admiralty was probably more effective than that taken by the War Office.

*Badging.*

The original war service badges issued by the War Office were accompanied by a certificate signed by Lord Kitchener.

"In token that his services are urgently required in the manufacture of ordnance war material for the defence of the realm, in which service he is required to exercise diligence and faithfulness."

By the end of July 1915, 79,738 badges had been issued, over 60%, however, to a very limited number of firms.

At this stage (Aug. 1915) the Ministry of Munitions comes upon the scene. It was clear that one of the first duties of that department would be to organize labour supply. This meant, as a first step, the protection of workers engaged on the output of munitions from further recruitment. Speaking generally, when the Ministry of Munitions took over the work, one-fifth of the males employed in the industry specially concerned with recruiting had joined the forces. As a first step, to regulate the position and to take powers, a provision was introduced into the Munitions of War Act, in July 1915, enabling the Minister of Munitions to make rules authorizing the wearing of badges by persons engaged on munitions work or other work for war purposes.[1] Provisional rules under this section were made on July 23, and became statutory on Oct. 9.[2] Before this date, however, namely on July 26, the Ministry of Munitions took over the administration of the badges from both the Admiralty and the War Office. Letters were immediately sent to the firms on the War Office and Admiralty lists of exemption, informing them that the basis of protection would be badges. At the same time letters were issued to firms on lists prepared by the supply departments of the Ministry of Munitions, in particular to firms such as machine-tool makers, iron and steel firms, principal electrical power stations, gas works extracting toluol, and chemical firms which had not been previously protected.

In order to keep this list up to date and to extend it where necessary, the Ministry of Munitions kept in constant touch with all the supply departments concerned and with employers of labour throughout the country; but from the first, and throughout, there was an almost inevitable conflict of interest between the points of view of the Ministry of Munitions as the department protecting labour for munitions work, and the fighting departments who were in urgent need of recruits.

[1] Munitions of War Act, 1915. Section 8.
[2] Statutory Rules and Orders, 1915. No. 1001.

The scheme was by no means a complete success. In the first place, there was the conflict of interest already mentioned. In the second place, it was difficult to obtain a scientific list of the firms to be covered, particularly when, as was the case, the types of munitions urgently required varied almost from week to week. In the third place, it was a matter of difficulty to decide to what class of men within protected industries or firms badges should be issued. Finally, at this stage the actual distribution of the badges was not in the hands of the department, but of necessity in the hands of the employer who alone knew the requirements.

Concurrently with the work of the issue of badges a new method upon which industry could be more scientifically protected was being provided by the National Registration Act of 1915. The registration undertaken on Aug. 15 1915 had among its objects that of discovering what proportion of men of military age were still eligible for service and what proportion of those were employed on work vital to the output of munitions. When the results were supplied special arrangements were made for writing the account of men in industries vital to the continuance of the war upon starred forms, and when at the end of Oct. the figures were reported by the Registrar-General and the Scottish Office it appeared that 29·4% of the whole available labour was in "starred" industries. Of that more than 50% was on munitions production, the remainder being on railways, mining and agriculture.

*National Registration.*

It was becoming apparent while these two steps were being taken to protect industry that the existing method of obtaining recruits for the fighting forces was not merely producing an inadequate supply, but was, by its indiscriminate nature, severely handicapping the output of munitions. Accordingly, in Sept. 1915, the question of an immediate adoption of compulsory military service was seriously weighed, but on the balance of considerations it was decided to make a last appeal on a voluntary basis—the Derby scheme. The essential aspect of the Derby scheme, from the point of view of limitation of recruitment, was the establishment of the local tribunal for giving exemption, which formed the basis of the tribunals which functioned under the Military Service Acts when they came into force. The question arose whether all men should be submitted to these tribunals, or whether those protected by the Ministry of Munitions and the starred lists should be automatically exempted. After discussion the question was settled by the issue, on Nov. 16 1915, of the following notice on the enlistment of munitions workers, signed by Mr. Lloyd George and Lord Derby:—

No man officially badged or starred for munitions work may be enlisted for immediate service in the Army. Men so badged or starred may be "attested" for the Reserve on condition of returning to civil employment. They will receive the khaki armlet, and will not be called up for service unless at some future time the Ministry of Munitions decides that they are more urgently needed in the Army than for munitions work.

Provision at the same time was made for the release from the colours of starred and badged men wrongly enlisted.

On Nov. 19 the Local Government Board issued the first instructions to the local tribunals, and in a public announcement the list of starred occupations subsequently reserved was set out as follows:—

List A.—Occupations required for the production or transport of munitions supplied by the Ministry of Munitions.
List B.—Coal-mining.
List C.—Agricultural, railway, and certain occupations in mining, etc.
List D.—Occupations (reserved occupations) of cardinal importance for the maintenance of some other branches of trade and industry.
Supplements to List D. were issued on Nov. 29 and Dec. 20 1915.

By this means, for the first time after the outbreak of war, something like a basis of a scientific protection for workers required for the output of munitions, and the maintenance of civilian necessities, was laid down.

*Military Service Act.*

The Derby scheme did not produce the necessary number of recruits. The facts were, as Lord Derby's report, made public on Dec. 19 1915, stated, that 1,029,231 unmarried men had not offered themselves for service, of whom

651,160 were not starred. This figure of itself sounded the knell of voluntaryism, and on Jan. 5 1916 Mr. Asquith introduced the first Military Service bill. From the point of view of limitation of recruitment the important provisions of that Act are contained in Section 2, which empowered a Government department to grant certificates of exemption to men on work of national importance in consultation with the Army Council. It provided further that a Government department might direct that certificates of this nature previously granted should be regarded as certificates within the meaning of the Act.

In the course of the discussion on the bill grave fears were expressed by the Labour party lest the powers of the Act, and particularly those as to exemption, should be used for the purpose of industrial compulsion. It was pointed out by Mr. W. C. Anderson on the second reading [1] that an employer would have power of life and death over his employee, and safeguards were accordingly introduced into the bill so that an employer should not, by merely dismissing a man, compel him to take military service. The Military Service Act became law on Jan. 27 1916. It was laid down that numbered badges issued by the Admiralty, War Office or Ministry of Munitions should be treated as certificates of exemption for the purpose of the Act.

Steps were further taken to exchange for numbered certificates the unnumbered Admiralty badges. The actual exchange was obviously a matter of considerable difficulty.

It is certain that for many reasons the exchange was never complete or satisfactory, but it is probable that no system could have been devised to render it so.

It was expected that the operation of the first Military Service Act would remedy the admittedly grave shortage in the inflow of recruits for the services. These hopes were not realized. Many causes operated to defeat them, but one to which increasing attention was drawn was the system of exemptions. The position was now reversed. At the outset of munitions shortage the forces were accused of starving the factories, now the factories were accused of starving the forces, the truth being that there were never enough men for both needs, and that each was supplied at the expense of the other according to the predominant military need of the moment.

However this may be, from the passing of the first Military Service Act the problem of limitation of recruitment became rather one of finding men for the forces than of preventing their enlistment, but with this vital qualification that they were to be found with the least possible loss to munitions production.

From this point begins the active policy of debadging, which was in effect the negative side of "dilution." Public feeling against men "under the umbrella" was growing, and so well-informed a critic as Lord Derby could say on May 18,[2] in the debate in the House of Lords on the second Military Service bill, which extended compulsory service to married men who had not attested:

*Debadging.*

"That is the question of men in munition works who are eligible for military service, and who are, in the opinion of the various localities in which they are working, only shirking by being in those works. That has given rise to more trouble with regard to recruiting than anything else. You have grocers, pawnbrokers' assistants, all classes of men going into munition works and securing exemptions; and it is the fact of their so securing exemption, although not skilled, that gives rise to so much irritation. . . .

"Arrangements are being made by means of a committee to debadge these men and secure them for military service. But I should be deceiving your Lordships if I did not tell you that these methods of debadging are excessively slow; and if we are to wait for that system to work itself out, coupled with two months' exemption, we shall not get the men as rapidly as is desired."

His reference to the Debadging Committee indicates a step which had already been taken in the hope of controlling the issue of badges. This committee, with Mr. Walter Long, M.P., as chairman, held its first meeting on March 20. But although it was a Cabinet committee of an authoritative kind it was able to accomplish little. The difficulty was one which was common to this and to practically all other subsequent coördinating committees set up to deal with the problem of the labour supply. The questions to be determined depended on two sets of considerations—(*a*) the general strategic policy of the Government, and (*b*) the practical facts of industry and production.

No committee could ever replace the actual departments concerned with the supply of munitions from the second point of view, nor the War Council or Cabinet from the first. This particular committee, possessing neither the power to decide policy nor the knowledge to settle badging questions in detail (which in the second week of May were coming in at the rate of 12,195 per week), was doomed to failure, and, after some months of struggling with an impossible task, made way for the Man-Power Distribution Board on Sept. 3.

But while the committee was sitting the departments were not idle. The extent to which protection from enlistment had now proceeded may be judged from a consideration of the results of two returns obtained from badged firms to the number of 12,000, May and Dec. 1916. These returns showed that, of a total number of 2,112,896 males employed, a total of 1,118,767 were of military age. Of these 698,587 were skilled, leaving a very considerable balance of semi-skilled and unskilled whose retention was naturally challenged. A return covering a wider area indicated that the total number of men protected either by badges, exemptions or recruiting officers' certificates, was 2,686,400. A change in the basis of badging was introduced in May 1916. Up to that date the employer had been responsible for the issue of the badges. From that date the direct responsibility for their issue was assumed by the Ministry of Munitions. This shifting of responsibility, while casting a great additional burden on the department, put them in a position to deal with the whole question more comprehensively and with greater certainty. It enabled them, for example, to attack with increased vigour the problem of debadging. Debadging was necessarily carried on in close association with and by the same officers responsible for dilution. The principles upon which these officers worked were to deal with all cases of badged men who were not occupied three-quarters of their time on important work, or whose work could be done by female or other labour ineligible for military service, and for whom substitutes could be found. If the men were skilled they should be drafted to other civilian work of national importance; if unskilled, to the forces. The task set these officers was one of great difficulty,[3] but by Aug. 1916 32,798 badges had been withdrawn, 9,475 firms, covering 850,268 badges, having been visited.

But even so the position was far from satisfactory. The first battle of the Somme had made severe inroads on the man-power of the nation, and the situation in this respect was perhaps as critical at the date of the establishment of the Man-Power Board as at any time during the war.

This board were set up with at least a partial understanding of the difficulties which had been encountered by the committee on exemptions, the place of which they took. Their functions included the settlement of questions arising between Government departments on the use of man-power, and the giving of directions to the departments. Moreover, programmes involving important demands for man-power were to be submitted to the board; the authority of which, subject to the War Committee, was final.

*Man-Power Board.*

The board were only more successful than their predecessors in that, by their recommendations, they brought the rapidly growing difficulty to a crisis. They found themselves confronted by the two same root difficulties. They could not regulate the programmes either of the forces or the departments, as they did not control policy, and they were bound, on the practical question of the number and quality of men required to carry out the programmes, to rely on the executive departments.

But in spite of these difficulties the Man-Power Board were able to make new recommendations of first-class importance. One was that no badge certificates should be issued to men (*a*) who had already been decertified by a Government department;

[1] Parliamentary Debates (1916) H. of C., LXXVII. 1416 *et seq.*

[3] For fuller account of "dilution," see below.

(*b*) whose cases were pending before tribunals; (*c*) to whom tribunals had refused exemption; (*d*) to whom tribunals had given temporary exemptions, and (*e*) already under notice to join the army. A second was that the Ministry of Munitions should be allowed to claim the services of men in the above classes, who would then, unless immediately required for service in an equally skilled capacity in the army, be transferred to reserve as the "army reserve munitions workers."

Two results emerged from these recommendations when they were adopted, neither of which could have been expected by those who made them. The first was the growth of considerable resentment amongst the skilled trade unions, who complained that the new arrangement was contrary to the pledge given by the Prime Minister that skilled men should not be taken for general service. This feeling was so strong that in the end it led to a complete revision of the basis of exemption by what came to be known as the trade-card agreement. In the second place the Man-Power Board saw that they could not hope really to deal with their main problem of adjudicating between departments, unless they had effective local machinery. Though the machinery they planned was never put into force, they had indicated two things. First, the vital need of the whole question of manpower both from the recruiting and the civilian points of view being under one authority. Second, the necessity that that authority should be independent of all the departments interested. In this way they sowed the seeds of the Ministry of National Service, and it cannot therefore be said, even if at the time the upshot seemed disappointing, that in the long run it was unfruitful.

*Trade-Card Agreement.*

The new policy of exemptions caused grave difficulties with the trade unions. Their complaints were:—(*a*) that recruiting officers ignored the validity of badge certificates; indeed that badged and certificated trade unionists had actually been arrested as defaulters; (*b*) that there were skilled men unbadged in railway shops; (*c*) that skilled men in commercial work were being taken, greatly to the detriment of the country's credit system; and (*d*) that skilled men with the colours were still being used for general service instead of skilled work. At the same time as these complaints were growing, grew the demand for men with the colours. To meet the demand, various proposals were mooted, but their shape was ultimately determined by the crisis precipitated by the wide-spread feeling of uneasiness among the men. There were three proposals before the Government. There was first the proposal of the Man-Power Board, which, subject to elaborate safeguards, suggested the immediate decertification and debadging of all men of military age under 26. There was the proposal of the Ministry of Munitions to leave all skilled men alone, but, with certain special exemptions for steel and similar work, to release all both semi-skilled and unskilled men as far as possible. There was finally the proposal of the skilled trade unions to the effect that no skilled men should be taken for the colours, that they should be protected from military service by a card issued to them by their societies and that skilled men with the colours should be used in mechanical units.

While these three proposals were being debated, the storm broke early in November. A strike at Sheffield centred round the recruiting of a man named Hargreaves, and in order to allay the general uneasiness, of which this strike was a symptom, on Nov. 18 the Trade-Card Agreement was signed at a meeting with the Executive of the A.S.E.:—

1. That all members of [1] the Amalgamated Society of Engineers as one of the Trade Unions of the skilled engineering trades not now fully engaged, or at any time hereafter ceasing to be fully engaged, on war work, shall enrol as war munitions volunteers, and thus place their services at the disposal of the country, in accordance with arrangements under the war munitions volunteers scheme.
2. The skilled men referred to in this agreement are men who were either journeymen or apprentices prior to Aug. 15 1915.
3. All skilled men on war work or who have enrolled as war munitions volunteers shall be provided with a card of exemption from military service. The form of this card will be authorised by the Army Council and the card will be issued through the trade unions. Orders will be issued by the Army Council to all recruiting officers that no man who produces such a card to the local recruiting officer shall be removed from his work without a specific authority from the War Office, which will not be given without reference to the Minister of Munitions and the executive of the man's union. In case of any dispute arising as to a man's right to hold a card, it shall be decided by a representative of the War Office, a representative of the Ministry of Munitions, and a representative appointed by the executive of the union to which the man belongs.
4. The provision of skilled mechanics for the army will in future be made by the Ministry of Munitions. The trade unions will do their utmost to provide the Ministry of Munitions with skilled men, who will undertake to serve at the choice of the Ministry either in the artificers' corps in the army or as war munitions volunteers in civil life. If skilled men for the army are not secured in this way, it is clearly understood that recourse must again be had to the statutory powers.
5. That the Amalgamated Society of Engineers will furnish names and, wherever possible, particulars of skilled men, now serving in non-mechanical corps, and the Army Council will continue to make every effort to transfer mechanical units.

The scheme was subsequently extended to the remainder of the unions in the engineering and shipbuilding group.

This agreement did nothing directly to increase the supply of men for the army, except in the condition which required skilled men to enrol themselves as war munitions volunteers and thus render themselves mobile. It remained accordingly for the Government to decide how to draw from the ranks of the skilled and the semi-skilled the necessary recruits. This problem was still unsolved when in the middle of Dec. 1916 the first Lloyd George Government was formed.

*First Ministry of National Service.*

The first step taken by the new Government in this matter was to form a Ministry of National Service. By doing this the Government recognised that the coördination of manpower could only be effected by an executive body, and that no committee, however powerful and strongly constituted, could hope to deal with a problem which was in the last resort inevitably one of detail. Thus one of the lessons of the Man-Power Board was learned, but the second and more vital was at this stage overlooked. The Ministry of National Service under its original constitution dealt only with civilian labour: it did not touch recruiting. This was a fatal flaw, for by the omission of this function not only did the department fail to balance the rival demands of the forces and home production, but it became a fifth wheel which, side by side with the organization of the Ministry of Munitions and the Admiralty, necessarily tended to revolve in the air, or if on the ground, then only to get in the way of the four effective wheels. As the result, till this defect was remedied by the reconstitution of this Ministry in Aug. 1917, the department was practically powerless.

But the needs of the forces and of production were incessant and remorseless. Consequently, until the reconstituted ministry was set up, the burden, as in the time of the Badge Committee and the Man-Power Board, continued to fall on the executive departments. These departments found that the Trade-Card Agreement had not alleviated their difficulties. Not only did the intake of recruits continue to be much below requirements, but the Agreement itself had led to new embarrassments of its own creation. On the one hand, so far as labour was concerned, it created almost as much unrest as it allayed. For its operation had been restricted to a selected list of unions, with the result that all those excluded resented their exclusion. On the other hand, from the Government point of view, a system which practically handed the exemption of skilled men to the trade unions was bound to work unsatisfactorily.

*Protected Occupations.*

In the beginning of 1917 accordingly the Government decided that the needs of the forces rendered imperative the abolition of the Trade-Card scheme. Its place was taken by the schedule of protected occupations. Under this schedule men engaged in the specified occupations on Admiralty, War Office or munitions work or in railway workshops were entitled to a "scheduled occupations certificate if over a specified age or in a medical category below A." Men put in scheduled occupations received a "protection certificate" of a more limited and precarious character.

[1] The words "the Amalgamated Society of Engineers as one of the" were added at the conclusion of the conference with the Government on Nov. 18.

It was obvious that this change would not be effected without the most strenuous opposition from the trade unions. It might have gone through, however, without actual industrial disturbance if it had not coincided in point of time with an amending Munitions Bill, which among other provisions rendered possible the compulsory introduction of dilution on private work. The combination of these new factors led in May 1917 to the outbreak of perhaps the most serious strike which the Government had to face during the World War. In the result the Government adhered to their schedule, but it was announced that progress with that part of the bill which provided for dilution on private work would be deferred. It did not, in fact, reappear.

Reference must here be made to the work of the Reserved Occupations Committee, which, dealing with non-munitions trades, had functioned continuously since Sept. 1915, side by side with the Ministry of Munitions and the Admiralty, and was finally absorbed in the Ministry of National Service in Aug. 1917. As the recruiting campaign was intensified during the end of 1915, and particularly when the tribunal system came into operation with the Derby scheme, it became obvious that a real necessity existed for the creation of some central body which could give advice to tribunals in respect of trades not covered by the Ministry of Munitions and the Admiralty. This committee, originally appointed in Sept. 1915, and composed entirely of experts, framed successive lists of occupations in which, in their view, men should be protected from recruiting. The lists had regard to the necessity of maintaining national trade and food supply. At no stage did the issue of these lists entitle persons covered by them to automatic exemption as was the case with badged men. The only effect of the list was to set clearly before the tribunals, before which the men concerned would appear, the view that recruiting in the "certified" lists should not be encouraged. The "certified" lists originally included "badged" occupations, but these were gradually eliminated as time went on, it being made clear that in the case of these trades men must rely on their badges and not on the list. The general tendency of these lists was, after the first general scheme had been settled, to reduce the area of exemption. This reduction was carried out in three ways:—

(1) By removal of industries from the list;
(2) by removal of occupations;
(3) by fixing, and from time to time raising, the age limit below which protection should not be afforded. The age limit was taken in conjunction with the question whether a man was married or single in some of the earlier lists and in the final list with his medical category.

Even the institution of the schedule of protected occupations, and the progressive reduction of the area covered by the lists issued by the Reserved Occupations Committee, did not meet the needs of the situation. By the middle of 1917 it became evident that an effort on the widest possible scale must be put forward to rally the man-power of the nation for the campaign of 1918. The Government set themselves to attempt to remove the difficulties which had been indicated by the successive failures of the Man-Power Board and the first National Service Ministry by setting up a reconstituted Ministry, which (*a*) was responsible both for recruiting and for allocation of civilian labour, and (*b*) had an effective labour priority committee which weighed the claims of the various classes of production, under the general direction of (*c*) the War Priority Committee, a Cabinet committee presided over by Gen. Smuts, which had power to give general instructions as to the parts of the programme to which special attention should be directed.

***Second Ministry of National Service.***

The new Ministry of National Service came into effective operation at the end of Aug. 1917. It was presented with a very formidable task. The Russian collapse and the likelihood that the campaign of 1918 might be decisive, together with the heavy wastage in the forces during 1917, rendered it vital that there should be a large addition to the forces. On the other hand the man-power resources at home were subjected to the greatest strain, (*a*) to meet the ever-growing and varying munitions programme, (*b*) to meet the urgent claims of food production rendered daily more vital by the increasing menace of the submarine campaign, and (*c*) to maintain normal private industry at the highest point possible in the interest of the nation's credit.

There can be no question that the associating under one minister of recruiting and the supply of civilian man-power profoundly affected and improved the situation. The mere transfer of military recruiting to a civilian organization in itself tended to inspire confidence in the ranks of labour, a confidence which was increased by reason of the fact that the same civilian authority was generally responsible for the supply of labour for all other national purposes. But this confidence in itself did not supply the necessary recruits. It became necessary as 1917 progressed to make new and drastic proposals to meet the demands of the armies. But while these proposals were maturing, steps were taken to provide a new pool of substitutes for men released for military service. The men in the army at home unfit for general service were catalogued in a card index showing their civil trades and the employers for whom they worked before enlistment. These men were available not only for munitions work, but for work of national importance. The needs of the land were met by the provision of part-time labour, by German prisoner labour, by the enrolment under the Board of Agriculture of the Women's Land Army, and by the temporary release for harvest operations of units of the Home Army.

But all these measures of themselves could not solve the central problem of recruiting which was more and more becoming one of a scientific removal of exemptions at a far increased speed. It was becoming obvious all through the autumn of 1917 that it was necessary to get rid of exemptions held on occupational grounds, thus avoiding the long and tedious process of applying to the tribunals for the withdrawal of individual certificates of exemptions. This policy, currently known as the policy of the "clean cut," naturally was regarded with disfavour by labour. But after a long series of conferences it was finally embodied in the Military Service Act of Feb. 1918. This Act was supplemented by a second, passed in April 1918 immediately after the beginning of the German offensive of that year, raising the age limit to 51 and giving powers to cancel certificates of exemption on personal grounds.

Under these two Acts, two Withdrawal Orders—one in April and the other in June—were carried cancelling exemptions in a large number of trades and occupations, including most of those named in the list of certified occupations, though the withdrawals in that case were generally confined to men in medical Grade I. The result of these measures may be summed up in the statement that, from the inception of the reconstituted Ministry to the Armistice, 70,000 men were posted to the colours. At the same time so far as food production is concerned the position may be summarized in the following table [1]:—

| | 1918 *Quarters* | 1916 *Quarters* | Increase over 1916 *Quarters* |
|---|---|---|---|
| Wheat | 11,644,000 | 7,472,000 | 4,172,000 |
| Barley | 7,768,000 | 6,613,000 | 1,155,000 |
| Oats | 31,196,000 | 21,334,000 | 9,862,000 |
| | *Tons* | *Tons* | *Tons* |
| Potatoes | 9,233,000 | 5,468,000 | 3,765,000 |

Finally the trade of the country had been maintained so that it emerged from the war second only to the United States in point of its financial credit.

(B) THE INCREASE OF LABOUR SUPPLY.—In order to estimate the problem to be faced in reënforcing the ranks of labour depleted by recruitment, it is necessary to set out what was the estimated employed population at July 1914, what was the total enlistment for the forces until July 1918, and what numbers, apart from any extraneous action, would in the ordinary course of nature have flowed in to fill the gap thus created.

There is no absolute statistical basis for the period in question, but a trustworthy estimate can be framed by an examination of the Z8 returns obtained by the Board of Trade, checked by the

[1] War Cabinet Report for 1918 (Cmd. 325).

census of population of 1911, and by considering the Board of Trade "Statistical Abstract of Information regarding the Armies at Home and Abroad" (No. 28–C5–1 Feb. 1917).

The Z8 return (supplied by employers to the Board of Trade) indicates that the employed male population in the occupations covered by the Z8 return, was at July 1914, 10,610,000. The total occupied male population shown in the census of population was approximately 4,060,000. The Board of Trade estimates that, allowing for the normal increase of population, and for emigration, this last number would have increased by July 1914 to 14,350,000, leaving a balance of 3,750,000 occupied persons not included in Z8 occupations. It is further estimated that of these, 2,150,000 were engaged as follows:—

***Analysis of Occupations.***

| *Occupation* | *Males Occupied* |
|---|---|
| Agriculture in Ireland | 850,000 |
| Mercantile marine | 125,000 |
| Clergymen, physicians, literary and other professional occupations | 270,000 |
| Sundry minor commercial occupations | 240,000 |
| Costermongers, hawkers, and sundry dealers. | 130,000 |
| Domestic service (outdoor and indoor) | 315,000 |
| Gardeners (except market gardeners) covered under agriculture in Great Britain | 160,000 |
| Other occupations | 60,000 |
| Total | 2,150,000 |

An examination of these categories will indicate that enlistment (except in the case of domestic service) would probably be inconsiderable, and it may fairly be estimated at not more than half that in the occupations covered by Z8. The total enlistment for the 10,610,000 covered by that return is 4,896,000. If half the proportion enlisted in these occupations is accepted in respect of the 2,150,000 males occupied in the miscellaneous occupations not covered by Z8, a total of about 450,000 is reached, giving a grand total of 5,346,000.

There remains the further 1,600,000 males necessary to complete the estimated total of 14,350,000 at July 1914. The majority of these would be employers and persons working on their own account, the one-man businesses from which in the nature of the case the proportion of enlistment would be comparatively small, and if 250,000 is added for this class this probably does not err in the low side. A grand total therefore of 5,596,000.

There are, however, still to be taken into account the unoccupied males, of whom there were approximately 200,000 in July 1914, and a considerable number of boys at school in 1914 who enlisted without entering an occupation. The proportion of enlistments here would in the nature of the case be high, and 250,000 would not be an excessive figure.

There is thus reached a total figure of approximately 5,850,000 for the whole of the United Kingdom. This will include reservists and territorials called to the colours at the beginning of the war both for the navy and army, but excludes men already serving with the regular forces.

This total can be checked by reference to the Board of Trade estimate for enlistment shown in the "Statistical Abstract of Information regarding the Armies at Home and Abroad." This shows the number of men enlisted in the armies up to the Armistice to be 4,970,000. To this must be added approximately 500,000 men called up to join the colours from the army reserve, special reserve, and pre-war territorials, giving a total not far short of 5,500,000. Similar figures are not available for the navy, but it is a very reasonable conjecture that the numbers would bring the total near the estimate of 5,850,000.

When this enormous total is envisaged, we see the task before those engaged on carrying on the output of munitions and the maintenance of vital services. Clearly if this 5,850,000 had been a net loss the problem would have been practically insoluble. It was not, however, a net loss, as will be shown immediately, but over and above the operation of factors tending to alleviate the difficulty, the principal steps taken, apart from the intensive use of existing labour, were the following:—

***Provision for Vital Service.***

(*a*) The diversion of labour from less vital work, a diversion effected as to the greater part not so much by Government action as by the operation of first patriotic impulse and then economic stress.

(*b*) The return of men from the forces for causes other than physical disability.

(*c*) The introduction of new sources of labour, *i.e.* Belgian, Dominion, and finally enemy prisoner labour, on the one hand and the enormous influx of female labour.

If we take the causes entirely independent of Government action, which reduced the total, the two most important elements are (1) men returning from the forces to civil work, and (2) the natural increase of the population. Under the first head it is probable that the total reached was in the neighbourhood of 700,000. The figure, however, includes both men discharged for disability and men returned from munitions. The number in the latter class is dealt with below.

As to the causes of increase not directed by Government action, these may be set out in the following tabular form, which is necessarily based on a comparatively rough estimate for the occupations covered by the Z8 returns:—

| | |
|---|---|
| Increase consequent upon natural growth of male population | 695,000 |
| Net immigration | 25,000 |
| Boys entering employment earlier than usual | 90,000 |
| Older men who deferred retirement or who returned to work after retirement | 200,000 |
| Males on strike or lock-out July 1914 | 40,000 |
| Males out of work on an average on any one day July 1914 | 250,000 |
| Men returned to civil work from the forces | 700,000 |
| | 2,000,000 |

To these must be added, in respect of the 4,000,000 not covered by Z8, approximately 100,000, making a total of 2,100,000. This figure is in a large measure conjectural, but if it errs, it probably errs (though not considerably) on the small side. As a matter of fact the actual tables based on Z8 returns show a total of 2,366,000. The difference between the two figures may be due to:—

(1) Inclusion among enlistments of a certain number of men who joined the forces more than once.

(2) Inclusion among enlistments of a certain number of men who would normally have had to be replaced owing to death, disablement, etc., and for other causes, *e.g.* in consequence of their having become employers.

(3) Possible slight exaggeration by employers of numbers enlisted.

(4) Possible slight exaggeration of total male employment owing to omission of some firms which were shut down.

The true figure is probably therefore somewhere between the two, but for purposes of estimating the total net loss the higher figure of 2,366,000 is taken.

To get the figure for the net loss on the 10,610,000 covered by the Z8 returns, there must therefore be subtracted from the 4,896,000 who had enlisted as at July 1918 2,366,000. An examination in the next place of the women employed in industry indicates that at July 1914 the number employed was 3,276,000, and that this had risen by July 1918 to 4,935,000, a net increase of 1,659,000 females. Of these additions to the ranks of industry analysis is precarious, but it is probable that not less than 75% were women who had left work or who entered upon it for the first time and that the remaining quarter were drawn largely from domestic service.

If the male and female replacements are added together the net numerical loss to industry is reduced to the comparatively small figure of 871,000. But this does not in the least represent the real loss to industry. In the first place, while the decrease in the number of males employed represented 23·8%, the increase in females was 50·6%. Without attempting to gauge the comparative values to industry of the sexes, these proportions of themselves indicate almost a quarter decrease of skilled or at any rate experienced persons, compensated for by an increase of unskilled or at best inexperienced persons. Moreover, so far as the male replacements are concerned, to a large extent these were not and could not be of the pre-war quality. To begin with, there was the large group of men discharged as physically unfit from the army. In the second place the newcomers were often, indeed for the most part, boys or men well past the prime of life or available for civilian service because of rejection for military

***Loss to Industry.***

service. This last statement is indeed amply borne out by an examination of the ages of males employed in Oct. 1918, which shows that approximately 43% were boys under 18 or men over 51½—a very high proportion indeed. When to these considerations is added the fact that never in the history of industry had work to be carried at greater speed, at such continuous pressure, and in such circumstances of physical and mental strain, the deficiency to be filled is difficult to estimate in numbers.

To meet this deficiency the one effective method was the regulation of labour so as to spread the skilled men over the widest possible area, to automatize the work to the last degree, and to introduce unskilled labour (by which in the last resort is meant woman labour) into every possible piece of work from which a skilled man could be withdrawn. The history of "dilution" is therefore in practice the history of how the deficiency was as far as practicable met. The other expedients, except the direct release of men from the colours, had a much smaller comparative effect. Such expedients as the use of part-time labour and the control of building licences to prevent the prosecution of private work had no doubt their effects. It is claimed, for example,[1] that 2,400,000 hours of part-time were worked in 1918, and that building licences in respect of work totalling £1,500,000 were dealt with in the same period. But when it is remembered that the average working year during the war was not less than 3,000 hours, this gives us the time of 800 men, and incredibly composite men at that!

The diversion of men from less vital to vital work was a more serious contribution, and still more serious the release of men from the colours. So far as the first is concerned, however, this was achieved rather by patriotic impulse, and economic and military pressure, than by any direct Government action. Various attempts were made from time to time to close down forcibly the luxury trades, notably by the first National Service Ministry. But these efforts were neither successful nor necessary. Greater forces than orders of Government departments were at work remorselessly weeding out the unnecessary business, and either converting it for use in some effective national capacity or distributing its workpeople to national work. For not only did patriotic citizens resent being kept on private as opposed to war work, but the less patriotic, as compulsory service began to draw on, were quick to realize the protection from military service afforded by work of national importance.

On this point it is perhaps sufficient to give the actual figures of additional males absorbed by July 1918 into the principal occupations that may be described as directly involving war work. In three branches of trade only, and these three the most vital to the prosecution of the war, was there a net increase in the number of males employed at July 1918 as against July 1914, as may be seen from the statistics:—

| | July 1914 | July 1918 |
|---|---|---|
| Metals (including engineering, etc.) | 1,634,000 | 1,824,000 plus 11·7% |
| Chemicals | 159,000 | 162,000 plus 2·1% |
| Government establishments (National factories, etc.) | 76,000 | 257,000 plus 237·6% |

In all other occupations there was a net decrease, which bears something like a direct relation to the remoteness of the industry from immediate war work, reaching at its highest in the building trade a net decrease of 52·1%. Except in the case of actual Government establishments, this huge shifting over must be attributed to causes other than direct Government action, though the machinery which put the changes into operation—the priority lists and the employment exchanges—of course facilitated a natural process which, without these aids, would undoubtedly have taken far longer to complete itself, and might indeed have been, if not directed, self-destructive. In this respect the employment exchanges rendered a service difficult to overestimate (*see* UNEMPLOYMENT).

The second device for increasing the available supply was the release of men from the colours. Of all the tasks set to the civilian authorities in control of labour supply, this perhaps of its nature offered the most obstinate difficulties in administration. Nor is this surprising when it is remembered that the men had to be recovered from an army literally gasping for recruits. It has been stated above that 700,000 men in all were released from the colours for civilian work. The vast majority of these were released on medical grounds. The number of fit soldiers actually recorded in Nov. 1916 as having started work was 51,781. The percentages of these over the trades in which they were employed was shown in Sept. 1917 as follows:— *Release from the Colours.*

| | |
|---|---|
| Shipbuilding and marine engineering | 30·1% |
| Mines and quarries | 1·3% |
| Metal smelting, forging, rolling, casting and drawing | 23·4% |
| Chemicals and explosives | 6·5% |
| Machinery plant and tools | 13·1% |
| Arms and ammunition | 14·4% |
| Aircraft | 4·9% |
| Transport vehicles | 2·7% |
| Miscellaneous | 3·7% |

The actual number of men recovered is perhaps not a fair criterion of the value of the scheme, as many of them were or described themselves as pivotal men, but on the other hand a considerable proportion were found to have been released under a misconception as to their skill. On the whole, however, it was obviously necessary to attempt something of the kind, and when the difficulties are considered the civilian authorities are entitled to congratulate themselves on a not inconsiderable achievement.

This brings us to the really substantial contribution which was by way of bringing into bearing a completely new body of labour, and this resolves itself largely into "dilution." *Dilution.*

The schemes for bringing in Belgian and Dominion labour, like the schemes for part-time labour, were more attractive in appearance than of actual service. So far as the Belgians were concerned, a certain number of skilled men came over in the first rush after the fall of Antwerp. To supplement the ranks of these, an organization, which worked with tireless energy, was set up in Holland to bring men over from that country. But though a good deal was accomplished the results with certain notable exceptions were disappointing. It was found in practice undesirable for various reasons that British and Belgian workmen should work side by side. It followed, therefore, that they could only be employed either in factories solely manned by men of their own nationality, or by firms so large that they could allocate to them a completely separate sphere of work. As a result they came to be employed only by such firms as Vickers, by one or two Belgian firms started in England for the manufacture of munitions, and finally and most successfully at the Birtley national factory. While, therefore, the high hopes originally entertained were not realized, a substantial, if limited, contribution was achieved.

The reënforcement by Dominion labour was less fruitful, and for obvious reasons. In the first place the number of skilled men (and the most acute shortage was always in this class) was not extremely high in the Dominions. But even if the number had been high it was never clear from the point of view of production whether it would not be better to use their services by placing contracts in Canada, Australia, etc. Indeed, it is probably true to say that as the war went on the general tendency was in this direction rather than in the direction of bringing the men over to the United Kingdom. And there were good grounds for this. In the first place, particularly as regards the Australians, there had to be taken into consideration not only the great distances to be covered, but the extreme difficulties with the immense calls on the mercantile marine of providing transport. In the next place, labour conditions as to wages, hours, etc., differed radically as between the Dominions and the mother-country. To introduce into the same shop men working side by side on the same work at different rates of pay necessarily would be productive of difficulties, and experience showed that anticipations on this score were not ill-founded. In spite, however, of all these considerations a certain number of men were brought from Australia, Canada and South Africa, and on the whole the

[1] War Cabinet Report for 1918 (Cmd. 325).

experiment was not unsuccessful. The numbers were small, but the men worked with zeal and loyalty.[1]

Finally, before dilution is described, there must be mentioned the employment of German prisoners. From the outset British labour refused to work side by side with these men, and indeed when their employment in the Medway shipways was mooted, a strike was only averted by dropping the proposal. They were in effect confined to agricultural work, and to certain isolated and uncongenial occupations such as quarrying. From the munitions point of view they may be left out of account.

The negotiations which preceded the introduction of dilution are dealt with below in the consideration of the Treasury Agreement of March 21 1915, and the subsequent events. What is described here is merely the mechanism by which a profound change was brought into industry without which it is certain that the munitions programme could never have been carried out.

Before, however, the actual introduction of women on to work previously performed by men is described, it is necessary to make it clear that this introduction on the mechanical side was only rendered possible by the immense simplification of the processes of production. It was the designers of jigs, the manufacturers of the automatic machines that rendered dilution possible, and the credit of making dilution possible must be laid at their door. And it is incidentally interesting to note, as will be noted more than once in the course of describing the regulation of labour, that war necessity introduced great and often beneficial changes in the whole structure of industry that have every appearance of permanence. In so far as the war preached the lesson of the automatic, a far-reaching change had been introduced, whether beneficial or not will be a matter for the future to decide.

There were two fundamental difficulties in the way of dilution. In the first place the employer resented the complete change of his system of working that dilution involved, and this attitude was only changed as the result of a long process of persuasion in which it is fair to say leading employers played an equal part with the officials whose special duty this persuasion was. In the second place there was the deep-seated objection of the trade unions to the invasion of the jealously preserved sphere of the skilled men by overwhelming numbers of possibly permanent competitors. When it is realized that both parties to the scheme—employers and employed—equally resented it the wonder is not that it took so long to launch but that it had in the end so convincing a triumph.

Up to Sept. 1915 practically no progress had been made. On Sept. 9 Mr. Lloyd George made an appeal to the Trades Union Congress at Bristol.[2] It met with some opposition, but undoubtedly had a profound effect on the labour movement as a whole, and the steady advance may fairly be marked from that date.

*Central Munitions Supply Committee.*

One immediate and practical result of that speech was the establishment of a Central Munitions Labour Supply Committee (which was partly an extension of the National Advisory Committee, referred to below, which had negotiated the Treasury Agreement) with the following objects:—

"A joint committee representing the National Labour Advisory Committee and the Ministry of Munitions with additional members to advise and assist the Ministry in regard to the transference of skilled labour and the introduction of semi-skilled and unskilled labour for munition work, so as to secure the most productive use of all available labour supplies in the manufacture of munitions."

The committee met for the first time and appointed two sub-committees to consider and report on (1) the fixing of wages in connexion with the introduction of semi-skilled and unskilled labour where only skilled workmen were previously employed and (2) the constitution and functions of local labour advisory boards. The proposals of the second committee, with regard to the duties of each board, were adopted by the Ministry on Oct. 14, as follows:—

(1) Its general function was to act as agent of the National Advisory Committee in the district, reporting to it and negotiating with the local representatives of the trade unions. But the board should in no case take up disputes with employers. That was either a matter for the Ministry of Munitions or for the trade union.

(2) It was the board's duty to see that employers carried out the provisions of Schedule II. of the Munitions of War Act, to report all cases of failure to the labour officer of the National Advisory Committee for action by the Ministry and to record or verify changes of workshop practice.

(3) The board should assist the Ministry in the enrolment and transfer of war munition volunteers. It would receive from the Ministry a statement of the number of men who could be set free from the various workshops, and should take steps to encourage the enrolment of men up to this number at least. The labour supply officer would also report to the board particular cases where sufficient enrolments could not be secured, in order that the board might remedy this if possible through the trade unions.

(4) The board should report to the labour officer or the National Advisory Committee all disputes and difficulties and cases in which men were engaged on private work or insufficiently employed, and should coöperate generally with the labour officers and the local representatives of the trade unions, to secure the most effective use of labour on the production of munitions of war.

Finally it was proposed that each member of the board should receive a fee of 2s. 6d. for attending a minuted meeting (not more often than once a day), travelling expenses (if he had a distance exceeding two m. to travel), and compensation for time necessarily lost from work at the rate of 1s. an hour. Trade union officials in receipt of fixed salaries were not entitled to claim this compensation.

These boards, though their mere existence probably contributed to the smoother working of the scheme, did not have considerable effect as executive agents. Nor is this surprising when it is remembered (*a*) that they consisted of members all of whom had full-time work in other directions, and (*b*) that dilution required for its effective institution the full-time work of specially trained men, whose sole object was the successful achievement of their task.

More important was the consideration by this committee of the all-important letter, known as CE1, addressed to all controlled establishments by Mr. Lloyd George early in Oct. 1915. This letter enjoined in the most precise terms the necessity for the immediate introduction of dilution, and to give point to this injunction the firms were required to fill up a form showing the number of skilled men employed in operating (1) machines of any kind on shell and gun work, (2) capstan lathes and other automatic and semi-automatic machines or other work, or (3) engaged in other processes which might be performed by less skilled labour. The result of this letter was entirely disappointing, the replies indicating that, in all the firms circulated, only 2,124 skilled men were available for transfer. But if it proved nothing else, at any rate the letter proved that the scheme could only be put through by actual personal visits on a large scale.

The next matter to which the committee, with a great measure of success, devoted their attention was the procedure for effecting dilution. The recommendations made by the committee on this head were adopted by the Ministry of Munitions and circulated as circular L6 to controlled establishments. The essence of the circular was to insist on ample consultation of the workpeople and their representatives before introducing dilution—a recommendation which, if more faithfully observed in practice, would have prevented many disputes. It also gave a preliminary list of processes upon which women might suitably be employed. Further it emphasized the desirability of introducing a three-shift system where possible, and of avoiding the employment of women on night-work—again an interesting example of the emergence from war necessity of a practical contribution to permanent social reform.

While the committee, in these directions and particularly in respect of wages matters, was rendering service of first-rate importance by preparing labour opinion for the acceptance of dilution, steps were being taken to set up the executive administration machine without which it was clearly impossible to carry out a policy dependent for its success on its detailed application. After numerous

*Dilution Department.*

[1] The total number of Dominion workmen came to about 7,000 of which by far the largest number (5,158) were Australians, whose passages, subsistence allowance and unemployment pay were met by the Australian Government. The number of aliens (Belgians, Dutch, Portuguese and Danes) was probably in the neighbourhood of 75,000, of which the large majority were Belgians.

[2] Trades Union Congress Annual Report 1915, pp. 353-362.

experiments the final and successful solution of the problem was the establishment of a strong Dilution Department, manned largely by engineers, with a central and local organization. The work of the Department, which had a large travelling staff, had two objects—the first to convince employers of the possibility of dilution on a scale hitherto unimagined, and the second to see that conviction was followed by practical effect, which meant in innumerable cases prolonged and delicate negotiations with local trade unions. It is not proposed here to discuss the industrial disputes, such as those on the Clyde early in 1916, which were occasioned by opposition to the dilution policy. It is sufficient here to say that, when the intense feeling necessarily engendered in workpeople by a policy which appeared permanently to mortgage their future is appreciated, the comparatively slight nature of these disturbances was a great tribute both to the dilution officers and to the patriotism of the workmen.

If ever it were true that it was the first step that counted, it was true of dilution. It will perhaps therefore be sufficient here if a brief reference is made (*a*) to the admirable work performed by the Clyde dilution commission, which in effect broke the back of the opposition to dilution in the area where it was most actively resisted, and thus gave an admirable start to the campaign; (*b*) to the attempt at a later period to introduce dilution on private work, and (*c*) to the principal characteristics of dilution.

The Clyde dilution commission was appointed on Jan. 22 1916. The Minister of Munitions, on the advice of the trade-union leaders, had visited Glasgow and made a speech on Dec. 25 1915, at St. Andrew's Hall, to a meeting of shop-stewards. The shop-stewards, who represented what was subsequently known as the rank and file movement in labour circles, were embittered opponents of dilution. Though the meeting was stormy, and followed by a strike and the seizing of an advanced labour organ known as *The Forward*, yet it was not without its practical results. The opponents of dilution had been faced on their own ground, and though a noisy section had broken up the meeting, the mere appearance of a minister, prepared to face such opposition, had driven home to good and doubtful citizens alike the vital issue in controversy. Mr. Lloyd George had prepared the way for the Clyde dilution commission, and though the greatest storm was yet to break, it cannot be doubted that his action had rallied not only public but labour opinion to the side of the Government.

The commission started its work immediately at Messrs. Beardmore's, and proceeded at the same time to deal with Messrs. Lang, of Paisley, and Messrs. Weir. This action was almost immediately followed by a strike at Messrs. Lang's, which was settled after an interpretation had been given of a point in dispute in the circular governing dilution. A further trouble arose when at the beginning of Feb. another labour organ, *The Worker*, was suppressed, and various persons connected with it were arrested. A strike followed which ceased when the men, who were subsequently duly convicted and punished, were admitted to bail.

In spite of this beginning the commissioners persisted in their work, and on Feb. 22 a circular letter was addressed to all controlled establishments on the Clyde, with the result that by Feb. 29 the commissioners were able to report that schemes of dilution were in operation at ten establishments, which provided for the release of 740 men and apprentices for more difficult and responsible work and the introduction of 1,333 persons, the bulk of whom were women.

This promising start was interrupted by the strike originating at Beardmore's on March 17, which lasted for a fortnight and led to the deportation under the Defence of the Realm Regulations of the ringleaders. The strike did not, as might have been expected, leave great bitterness behind it, and the commissioners were able to continue their work with such success that at the end of Aug. 1916, after having arranged for the employment of 14,000 women, they were able to hand over their work to the administrative machine which was now actively-functioning.

The work of the Clyde dilution commission exhibits on a large scale the work carried out from day to day with always increasing success and facility by the dilution officers of the Ministry of Munitions. How many women they directly introduced cannot be said. It would of course be absurd to claim that the officers were responsible even to an appreciable extent for the influx into industry of 1,659,000 females referred to above. There were in the first place the Government establishments themselves with 223,000 more females than pre-war, and the vast majority of these were introduced without the direct intervention or indeed in many cases without any intervention by the Dilution Department. Then there were some 158,000 females in the Civil Service and some 600,000 females in occupations with which the Department were not concerned. But allowing for all this it is not open to question that in controlled establishments their work was of the highest importance, and that without it the introduction of women could never have approached the figure it ultimately attained. It should be added that the responsibility of dilution for Admiralty establishments was transferred from the Ministry to the Admiralty at the beginning of 1917 when the Admiralty Shipyard Labour Department was established. Thereafter the two departments worked side by side following common principles and closely similar methods. Later when the Ministry of National Service was reconstituted in Aug. 1917 the possibility of transferring the executive work of dilution from these departments to the Ministry of National Service was mooted. But it was ultimately decided that the work could not be better performed elsewhere, and the Ministry of National Service therefore confined itself to requiring an account of the progress of dilution and to developing substitution in areas not covered by the Admiralty and the Ministry of Munitions.

The interest for the present purpose of the attempt to introduce dilution in private work is not in the success that attended the effort. For it had none, and from this source no contribution to the man-power of the nation was made. The importance of the effort is the indication which it gives of the change in the objects of dilution. When the scheme was first canvassed in 1915 it had for its only object the increased output of munitions. It was generally understood, and indeed pledges were given, that no skilled men should be released for the armies in consequence of dilution. But during 1916, and particularly after the first battle of the Somme, dilution came to be regarded at least as much as a means of securing men for the colours as of increasing munitions production. As 1916 drew to a close and the army's need for men was more acute than ever, it was decided to extend dilution, hitherto strictly confined to munitions work, to ordinary commercial work. The result of the attempt, combined with the abolition of the Trade-Card scheme, produced the great engineering strike of 1917, and the proposal was deferred, never to be taken up again. The trade unions were prepared to part with what they regarded as their industrial liberties in the national cause; they were sternly and finally opposed to part with them in what seemed to them the interests of private profit.

Before judgment is passed on the unions for their attitude, it is desirable to have in mind what in fact dilution really meant in practice and how deeply it cut into the cherished safeguards against unemployment and underpayment which years of trade unionism had patiently built up. Dilution involved four things all interconnected; subdivision of processes, the installation of specialized automatic machinery, the upgrading of existing labour, and the introduction of new labour. Each of these four aspects of the system was bound to modify not only temporarily, but in some degree permanently, the whole organization of industry. It was plain that when employers had once realized the success of mass-production, which was rendered possible by subdivision of processes, and the introduction of the automatic machine, they would be slow to abandon on private work what had proved so eminently successful on war work. It was true of course that with the disappearance of war orders for immense quantities of standardized articles the possibilities of mass-production would be seriously curtailed. But the employers had learned a lesson, and the unions realized that when the war was over it would not be forgotten.

Moreover, the subdivision of processes combined with upgrading tended to blur, if not to obliterate, the sharp line drawn between skilled men and all other workers. To appreciate the feelings of trade unions on this change it would help to consider what would have been the feelings of the medical profession if the Government had insisted that they should admit herbalists to their ranks.

Finally, the introduction of huge numbers of possible competitors was in itself a grave consideration, particularly in the engineering trades which were no strangers to a high rate of unemployment. Indeed the engineering trade was one of the six trades compulsorily insured under the Insurance Act 1911 against unemployment, as being specially affected by periods when work was not plentiful.

If, therefore, in spite of the natural reluctance of the trade unions and of the employers to accept dilution, and in spite of the great technical difficulties of its introduction in practice so great a measure of success was attained, the result is a high tribute not only to the dilution officers but to the employers and workpeople.

Finally, before leaving the measures adopted to reënforce the labour supply it is necessary to refer briefly to the training of munition workers. We need not explore the long history of negotiations with trade unions and education authorities which preceded the launching of the scheme of July 1915. It will, however, be some indication of the success which attended the scheme if it is stated that up to Aug. 31 1916 about 22,500 students received certificates of proficiency from the technical schools, of whom not less than 18,000 were placed. Moreover, at that date a great step forward was taken by the establishment of the first instructional factory. Messrs. Straker Squire's establishment at Twickenham was taken over and the foundations were laid for a scheme which not merely proved of immense service during the war but which was developed on an even greater scale after the war for the training of disabled ex-service men. By the end of the war about 50,000 persons had graduated through training establishments. Here once again war necessity had pointed the way to what may well develop into a permanent addition to the industrial resources of Great Britain.

(C) THE INTENSIVE USE OF LABOUR.—It is a mistake to suppose that working-men, as a general rule, any more than any

other class of the community, are prepared to adopt a roving life. There are certain occupations such as those of the navvy, and in less degree of the builder, in which regular movement is an essential incident. But generally, although the working classes probably tend to migrate more easily than other classes, they share the general preference for a fixed home and unchanging environment. But from the beginning of the war it was plain that mobility would have to be largely stimulated. It was, as Mr. Lloyd George said at Manchester in 1915, "an engineers' war," and it was plain that one or both of two courses must be adopted —either men must be brought to the engineering centres or engineering must be spread over areas where it had not previously been carried out, or both expedients must be adopted. The approach to this problem indeed passed through at least three stages—the first in which the man was brought to the work, the second where the work was brought to the man and the third a combination of the other two.

(1) *Increase of Mobility.*—The first step of all was when, at the beginning of Aug. 1914 labour was supplied to Aldershot to get the Expeditionary Force off to France, and men were moved in large numbers from the northern shipbuilding yards to the naval dockyards. Valuable and indeed vital as this service was in itself, it did not really form part of the general plans for increasing mobility. Many, indeed a majority, of the men engaged on getting the Expeditionary Force off returned after a short period to their old work; and this, though in much less degree, was also true of some of the men moved to the dockyards.

The origins of a more general effort were found in the King's Squad, organized in July 1915 by the Newcastle armaments committee, and the war squad organized by the Glasgow committee. But it is necessary in the first place to give some explanation of the events that led up to the formation of these committees.

When about the beginning of 1915 public attention was riveted on the shell shortage, the general view held by the authorities was that the only way to increase production was to place further orders with the very limited number of Government establishments and private firms that had experience in the manufacture of munitions. All these establishments had declared emphatically that they could not possibly increase production unless (*a*) they could have a largely increased labour supply, and (*b*) trade union restrictions could be removed. The solution of the second demand was afforded by the Treasury agreement and the subsequent Munitions Acts. But the first demand in itself helped to create a position which converted the authorities to the belief that work must be spread to where the men were, rather than impose on the already breaking resources of the great armament firms a burden which was *ex hypothesi* beyond them.

*Armament Committees.*

As early as the end of 1914 the Board of Trade had challenged the policy of concentrating labour on the armament firms. They had suggested the possibility of group arrangements in districts with engineering experience where by a reasonable subdivision of work among the various firms the whole article required by the War Office could be provided. The War Office, however, did not accept this view, and in accordance with their wishes the Board of Trade made an intensive effort to discover new sources of labour and to divert to the armament firms large bodies of workpeople from other engineering works. The first part of the campaign has been already mentioned. The result of the second part was, as the Board of Trade anticipated, a failure. Employers were not prepared to release their men, when most of them felt confident that if contracts could be placed with them they could carry out the work far more expeditiously than if the same contracts were undertaken with men new to them by the already overburdened armament firms. As a matter of fact, at the end of Jan. the total number released by employers on commercial work for armament firms had reached a total of 942. The value of this figure will be realized when it is remembered that at this period one armament firm alone (Messrs. Armstrong's) were asking for 4,150 men.

It was plain that matters could not be left at that point. The Board of Trade proposed a survey of the engineering trade in order to discover what its capacity for armament production was. This plan was not adopted, but later a Home Office census of machinery following much the same lines was put in hand and produced excellent results. The Board of Trade were, however, authorized by the War Office to exhibit samples of shells, etc., at various engineering centres with a view to obtaining possible offers from local manufacturers.

In the meantime, following on a successful experiment on organizing a saddlery group in 1914 by the Board of Trade, the first coöperative group of manufacturers was formed in Jan. at Leicester. This group was formed under the auspices of the Board of Trade on Jan. 8, and the first order for 1,000 4·5 shells per week was placed with it by the War Office on March 30.

At this point the armament outputs committee of the War Office, under the chairmanship of Mr. G. M. Booth, and a little later the Treasury munitions committee, under the chairmanship of Mr. Lloyd George, come upon the scene. Mr. Booth and his committee from the outset took the view that both of the contending policies must be worked side by side—that is to say, that within the areas of the big armament firms men should be brought to the firms, while in other engineering areas the work should be brought to the men by distribution of contracts.

These principles were endorsed by the Treasury munitions committee, but they took the matter one step further by ordering the construction of national factories, a proposal first put to them in a memorandum presented by Sir P. Girouard.

Thus by April and May 1915 the principles, though destined to every form of subsequent modification of detail, had been established which moulded the whole supply of labour for munitions throughout the war. In short the vital decision had been reached that the whole engineering capacity of the nation should be used. In the first place the great firms with years of experience should be strengthened to the greatest extent possible, but this strengthening was not to be at the expense of encouraging the wide distribution of contracts to all firms or groups of firms capable of munitions manufacture; and in the second place national factories were to be set up under direct State management to supplement production from the other two sources. These general decisions depended for their successful carrying out in practice upon the supply of labour required being forthcoming. While it had been decided that movement of labour should be limited by spreading contracts, it was still obvious that before the work and the workman could be successfully brought together there would have to be considerable adjustments. The Board of Trade had through their employment exchanges already stimulated movement to a great extent, but the time had now come for a further step forward. As part of Mr. Booth's scheme for concentrating labour in armament firms in districts where these firms existed, two committees were established in Newcastle and Glasgow, known respectively as the N.E. Coast and the West of Scotland Armaments Committees.

*Spreading of Contracts.*

Of these two committees, that of the N.E. Coast was the earlier and perhaps the more successful. It addressed itself immediately to the question of the transfer of labour from commercial to munitions work. With this end in view it took two steps: the first, which followed the precedent adopted by the Board of Trade, was to appeal to employers to release men; the second, destined to form the germ of the war munitions volunteer scheme, was to appeal to workmen to enlist voluntarily for munitions work. The first, even with local influence, was a failure, producing a negligible number of men for transfer, but the second was a striking success. By the middle of May under the first head 290 men had been transferred, by the end of June under the second 1,080. At Glasgow a similar appeal for volunteers produced 434 transfers. But not only did these committees by the method of direct appeal lay the foundations of the war munitions volunteer scheme, but they went further and settled two vital points as to the basis of their employment. These points arose on the question of who was to be responsible for travelling and subsistence allowances of men transferred. It was

finally decided, with the approval of the Treasury munitions committee, that both these charges should be borne by the Government, and the financial basis of the war munitions volunteer scheme was thus established.

But matters had now reached a point where local effort, guided only by a small expert committee, could no longer control the situation. A strong movement was on foot for the supersession of the committee by a strong central department. The first step in this direction was taken when, on the advice of the Treasury munitions committee, Sir P. Girouard and Mr. Booth were appointed by Lord Kitchener to carry out the general scheme for the increase of the output of munitions proposed by Sir P. Girouard. This was on May 9, and Mr. Booth and Sir P. Girouard set themselves actively to work to create a department. But events were moving with such swiftness that by May 26 the Prime Minister announced that a new department for the manufacture of munitions was to be established, and on that day Mr. Lloyd George took over this department at Whitehall Gardens.

*Ministry of Munitions.*

The first steps taken by Mr. Lloyd George were to take over the organization of Sir P. Girouard and Mr. Booth to form the basis of the great supply departments of the Ministry of Munitions that were almost miraculously to alter the munitions position, and on the other hand to bring in Sir H. Llewellyn Smith, then permanent secretary of the Board of Trade, as general secretary of the Ministry with special charge of labour matters, thus laying the foundations of the two great departments of the Ministry that were ultimately to be known as the Labour Supply and Labour Regulation Departments.

It was upon the labour side of the new Department that the duty devolved of working out the schemes for transfer of labour initiated at Newcastle and Glasgow. Nor was much time lost in setting about this task. On June 8 1915 Mr. Lloyd George met the National Advisory Committee and represented the gravity of the national situation, particularly from the point of view of munitions production. The National Advisory Committee devoted the next day to the consideration of a scheme which might help by increasing mobility to remedy the shortage of labour. They proposed in effect the extension to the country as a whole of the schemes adopted at Newcastle and Glasgow. Only skilled workmen in employment, but not engaged on Government work, should be enrolled. The volunteers should be transferred only to firms controlled by Government whose profits were restricted. They should on transfer be entitled to the same subsistence and travelling allowances as were authorized in respect of the earlier schemes. Mr. Lloyd George accepted the scheme in principle at conferences with the trade unions on June 10 and 16, and the war munition volunteer scheme was born. The conditions of the form of enrolment are worth giving *in extenso*.

*War Munition Volunteers.*

"In accordance with arrangements which have been made with the Minister of Munitions by the National Advisory Committee, acting on behalf of the Trade Unions, I undertake with the Minister of Munitions to accept employment on making munitions of war in such controlled establishments as may be named by him, and to remain in such employment during the war for so long as required (not exceeding six months in all) subject to the conditions set out.

"1. The rate of wages paid will be that of the district to which the workman is transferred, provided that if in any case the workman proves that this is less than the rate he was receiving before enrolment, he shall be entitled to receive such higher rate.

"2. The workman will receive over and above his wages the following allowances:—

"(*a*) If brought from a distance beyond that which he can reasonably travel daily, railway fare at the commencement and completion of the work for which transferred; and, where necessary, subsistence allowance at the rate of 2s. 6d. per day for seven days per week. It is clearly understood that the subsistence allowance is not intended to enable any workman to make a pecuniary profit.

"(*b*) If within daily travelling distance (exceeding half an hour each way) the value of workman's tickets and one hour's travelling time per day at the rate of time and a half.

"(*c*) If within daily travelling distance (not exceeding half an hour) the cost of workman's tickets.

"Subsistence and travelling allowances will be paid by the firm employing the workman, with the wages.

"3. The workman may volunteer for a further period of employment after the completion of the period for which he is required in the first instance.

"4. Any workman transferred from employment under this undertaking shall, if found suitable, be guaranteed employment during the war for a period not exceeding six months.

"I agree that any breach of this undertaking may be dealt with by a munitions court, consisting of a chairman appointed by the Minister of Munitions, with assessors equally representing employers and workmen, which may impose a fine not exceeding £3."

It may be noted that throughout the discussions at this stage Mr. Lloyd George accepted the war munition volunteer scheme as the alternative to industrial compulsion.

The scheme was accepted in principle on June 20. On June 24 enrolment began under the auspices of the Labour Department of the Ministry of Munitions. A vast campaign of publicity was started, and munition work bureaux were initiated with almost startling rapidity at 200 town halls and 200 labour exchanges. The intensive period of enrolment was closed on July 10, though enrolment continued after that date at the labour exchanges. The final results of the enrolments were as follows:—

| | |
|---|---|
| Platers, riveters, drillers and shipwrights | 23,564 |
| Tool-makers, toolroom workers and gauge-makers | 1,834 |
| Tool-setters | 193 |
| Millwrights | 1,727 |
| Turners | 7,971 |
| Fitters | 24,830 |
| Capstan and turret-lathe operators | 830 |
| Skilled metal machinists | 6,710 |
| Other metal machinists | 1,884 |
| Workers in brass and other metals | 4,667 |
| Lead-burners | 256 |
| Coppersmiths | 395 |
| Miscellaneous unanalysed | 27,166 |
| | 102,027 |

These were promising figures, but the result was to show that the first expectations were not to be realized.

In the first place it was obviously necessary that the employers, on whose work the volunteers were engaged, should have an opportunity of expressing their views on the transfer. Accordingly arrangements were made for a regular system by which employers should be given an opportunity of lodging a protest, and an expert panel of adjudicators on these protests was set up. When it is realized that protests in respect of no less than 60,000 volunteers were lodged, the sort of task set the adjudicators may be imagined. Nor was the volume of the protests the only difficulty. To decide on a protest involved an inspection of the firm to ascertain its direct or indirect contracts with the War Office (a constantly varying factor); to see the order books, and if necessary verify the work by inspection of the shops; to report on the nature of the work done by the volunteers; to find out what numbers of men of the same grade as the volunteers were employed by the firm, and if on short time or overtime; to discover what the effect of removal of volunteers would be on private work and on the continuance of the establishment.

Inquiries such as these made the progress of adjudication slow. Moreover, many men had volunteered who were not really skilled, and many more who were, without knowing it, engaged on munitions contracts, or who, knowing this, desired a change of firm. The result of the scheme at the end of Sept. was reported as follows:—out of 103,000 volunteers, 37,551 had been submitted to employers, of whom 28,551 had been rejected and 8,581 had been accepted. Of those accepted, only 4,529 had started work, including 721 placed by the Clyde and N.E. Coast Committees.

These results were at first sight extremely disappointing. The reasons for the comparative failure have already been indicated—*i.e.* employers' protests, the number of unskilled men volunteering, and the fact that many volunteers were engaged on munitions work. But there was another cause which had a very profound effect. The volunteer was entitled on transfer, in accordance with the Government undertaking, to the rate which he was receiving before transfer. Not only, especially in the case of piece-work earners, did this lead to grave administrative difficulties, but (what was more important) it excited the apprehensions of the employer, who viewed with dismay the prospect of the introduction into his works of men receiving different rates of pay from those enjoyed by his own workpeople. But all this does

not show that the scheme, if disappointing, was a failure; 100,000 men scattered all over the country had been enrolled. Very few, it is true, had been moved, but all, if the Government so decided, could be moved, for Sect. 6 (2) of the Munitions of War Act, 1915 made it an offence for an employer to attempt to dissuade a volunteer from moving. Unless, therefore, an employer in the early stages of the war radically reduced his private work, and in the later stages pressed dilution to its fullest extent, he was liable at any time to lose some of his best workers. In this indirect way the scheme had a far-reaching effect.

During the latter part of Sept. 1915 efforts were made to improve its working by a change in the method of administration. Under the scheme as originally launched the work had been done from London. An attempt was made in Nov. to carry out the work through the employment exchanges. The lists of men available for transfer (amounting to 10,000) were forwarded to the appropriate exchanges, who were given elaborate and precise instructions as to procedure. But the new system had no better results than the old. In Nov. and Dec. 1915 only 753 were placed, although, in addition to the 10,000 men whose names had been sent from the Ministry, 6,515 more men had enrolled.

At this point the problem was complicated by reason of the fact that undertakings were running out and that reënrolment was becoming necessary. Invitations to reënrol were issued, and the response indicated that there was much dissatisfaction among the volunteers. None the less, enrolments proceeded speedily at the rate of about 2,250 a month. At the same time placings went on steadily, rising from 237 in Jan. 1916 to 337 in May, with the result that in June 1916 12,234 war munition volunteers had been placed in employment.

*Criticisms of the Scheme.*

Again, one is face to face with the criticism that the scheme failed, and again it is necessary to point out that the failure was only partial. If numbers alone are examined it may be urged that the result was trifling, but numbers alone are by no means the final criterion. These men in effect constituted a mobile corps who could be thrown in at the point of greatest pressure at the most critical moments. They were a sort of Guards Brigade, who could be hurried to the weak spot when most needed. For example, in the autumn of 1916 more than a quarter of the skilled men employed at Dudley, Lancaster, Leeds, Renfrew and Templeborough were munitions workers. And again and again in the later years of the war, when every month, almost every week, involved sudden changes in the munitions programme, the availability of these men was of the highest possible service. It happened more than once, notably when the poison-gas factories formed almost a turning-point in the munitions programme, that the fitters, without whom the factories could not operate, were supplied from volunteers.

The work proceeded steadily, with the result that by Nov. 1918 212,000 war munitions volunteers had been enrolled and 81,180 transferred. This of course shows a notable improvement in 1917 and 1918. One of the reasons for the improvement, no doubt, was, for example, that enrolment was one of the conditions of the Trade-card Agreement.

As recruiting became increasingly intensive it was made clear that not only must a man, to obtain exemption, be shifted, but he must in addition be on indispensable work. By enrolling as a war munitions volunteer a skilled man automatically fulfilled the latter condition. Quite apart, therefore, from the patriotic impulse which moved men to seek work of national importance, enrolment, as affording a protection in itself, became increasingly attractive. It may, therefore, be fairly said that on the whole, over the period from its inception to the Armistice, the war munitions volunteer scheme both directly and indirectly was of vital national service.

Closely allied to, and indeed at the time indistinguishable from, the war munitions volunteer scheme was the scheme of the other mobile corps, incorporated in 1916 by the Ministry of Munitions, of the army reserve munitions workers, under which, by the end of the war, 58,200 men had been placed in employment. Under this scheme men were drafted into the army, but not detailed for service on placing themselves at the disposal of the authorities for use where they were required. The difference between them and the war munitions volunteers was more technical than actual, though in their case they were always liable to be called to the colours for general service.

Before leaving the war munitions volunteer scheme, brief reference should be made to the other pools of mobile labour which it was sought to form later in the war on the precedent of the war munitions volunteers. There were three schemes inaugurated under the first auspices of the old Ministry of National Service, the second and third under the reconstituted Ministry. The first was known as the National Service volunteer scheme. Under this scheme the surprising total of 400,000 volunteers were enrolled. As, however, invitations to enroll were issued to persons with little regard to their experience and ability, and to the work upon which they were engaged, it is not to be wondered at if the scheme produced no results. Indeed, by the time that this scheme was launched early in 1917, it is not an exaggeration to say that the field of labour available for vital national service had been searched not with a rake but with a fine-tooth comb. The only hope for any effective addition to the labour supply was by a carefully selected list of occupations adapted to persons of little experience in manual labour and of small or reduced physical powers. The second scheme of war work volunteers, initiated by the reconstituted Ministry of National Service, was on a smaller basis, and under this 32,700 persons were enrolled and placed on work of national importance, thus releasing younger men for the army.

There was finally the much more modest, though by no means ineffective, scheme of war agricultural volunteers, under which 3,255 persons were placed in agriculture. In addition to this, 17,000 women were enrolled in the Women's Land Army, and 1,816 in the Scottish Women's Land Army.

(2) *Preventing Wastage.*—When the supply of labour was far below the demand, it was of the greatest importance that the fullest possible use should be made of it. There were two vital points in this respect—the first to *get* it where it was wanted, the second to *keep* it there. The war munitions volunteer and allied schemes were the means adopted to achieve the first purpose. The Defence of the Realm Acts and the Munitions of War Acts were used for the second purpose.

The question which presented itself to the Government early in 1915 was:—What check could be put on the freedom of the workman, on the one hand, to go to work not profitable in the national interest, and upon the freedom of the employer to attract him there? There were four courses open. The first was to close down commercial work so that the employer would be compelled to release his workmen for work of national importance. The second was to impose penalties on employers engaged on commercial work for attracting labour from munitions work. The third was to apply the penalty for moving to the workmen. The fourth, which was the simplest, and which was shown to be repugnant to the British character, was universal compulsion whether for war-work or fighting.

*Competition for Labour.*

Whichever remedy was to be adopted, the fact that some remedy must be found grew plainer every day. Not only was it clear that a great volume of labour urgently needed for munitions work was still retained for commercial production, but what added to the difficulty was the bidding among contractors engaged on munitions work for one another's labour. Not only were rates of wages undergoing the most surprising variations, but every kind of device to add to workmen's earnings was adopted. Excessive overtime at double rates was freely advertised, immemorial practice as to travelling allowances was overturned, systems of piece rates designed to produce the highest rather than the lowest earnings were devised, and indeed in the shipyards there were allegations that a number of rivets were added to a workman's total to swell his takings. Nor was the competition confined to private employers. The Government factories were bidding not only against private employers but against one another. The result was naturally, by making workmen restless, to reduce production all around.

All the four expedients mentioned above were canvassed by the Government. The fourth,—universal conscription,—by reason of its simplicity and its boldness, was the most attractive. Scheme after scheme to enforce it was considered only to be rejected when the result on labour opinion was weighed, but as late as June 3 1915, in a speech at Manchester, Mr. Lloyd George

was suggesting the advantages of this way out. And the war munitions volunteer scheme, like the Derby scheme that followed it, was introduced as the final alternative to industrial conscription. But unlike the Derby scheme, when it failed to realize expectations it was not converted into a compulsory scheme. The country was, as events showed, prepared to be conscripted for fighting. It was not prepared to be conscripted for working, when the work was still in a large measure to yield private profit.

Industrial conscription as a means of preventing wastage was, therefore, never adopted. The three other methods were all attempted—the first with no result; the second two, as will be shown, with very considerable results. In March 1915, a bill was introduced and passed through both Houses of Parliament in two days, amending Section 1 (3) of the Defence of the Realm Consolidation Act 1914, which empowered the Admiralty or the Army Council

"(*a*) to require that there shall be placed at their disposal the whole or any part of the output of any factory or workshop in which arms, ammunition, or warlike stores or equipment, or any articles required for the production thereof, are manufactured;

"(*b*) to take possession of and use for the purpose of his Majesty's naval or military service any such factory or workshop or any plant thereof."

This was amended to enable the Admiralty or Army Council to take over private factories and shipyards and to require them to be worked as directed, and "*to regulate or restrict the carrying of work in any factory or workshop.*" The object of these words was not plain on the face of them, but their intention was to enable the Admiralty or Army Council, by giving directions which would in effect close down a factory or workshop, to cause the labour to be diverted to war work. This intention was made plain when this provision was reënacted by Section 10 of the Munitions of War Act 1915, with the addition of words directly referring to the engagement or employment of any workman or classes of workmen.

Like many other war enactments this power proved useful, but not for the purpose for which it was intended. The wholesale closing of factories in order to release labour was seen almost at once to bear too much similarity to the Chinaman's method of roasting pig. It would not only gravely dislocate trade, but it would necessarily throw out of work, not only the skilled men who would be readily reabsorbed, but a large army of unskilled men for whom work was not at the time available. Moreover, the new theory of sending work to the workman rather than the workman to the work was beginning to gain ground. And the provision, though reënacted, from this point of view fell into desuetude. But from the point of view of a weapon often flourished, and on very rare occasions used, it remained a potent weapon till the end of the war for coercing refractory employers.

The second method was attempted in the following month. On April 29 a regulation was made under the Defence of the Realm Regulations (amended later to extend its scope) imposing a penalty on manufacturers of munitions for (*a*) attracting men away from munitions work, and (*b*) for engaging any workman resident more than 10 m. from the factory in question except through a labour exchange. And as supplementary to this, the Board of Trade made a regulation under the Labour Exchange Act requiring employment-exchange officials to give priority to vacancies on war work. These regulations, except possibly in a deterrent sense, were hardly more effective than had been the effort on the first plan. So far as the first offence was concerned, evasion was fatally difficult to detect; indeed there was throughout the war no instance even of a prosecution on this head. Moreover, there was one perfectly simple method of evading the spirit of the regulation without infringing the letter. All that was necessary was for a firm to raise wages above the level of its competitors, and leave the news to percolate, as it invariably did.

So far as the second part of the regulation is concerned, there can be little doubt that it did contribute substantially to the centralization of labour supply, but here again the means of evasion were easily discovered. Where men from a distance were required, if it could be arranged that they should shift their residence of their own accord to within 10 m. of the factory, they could be, and constantly were, taken in at the gates.

The solution was found under the third scheme. It had long been clear that the effective method was to restrict the workman's liberty of movement rather than the employer's right to engage, while at the same time taking action to limit the employer's freedom to fix any rates of wages which he might choose. The delay in resorting to this method was due to the great reluctance which was felt in introducing any measure which could readily be represented as, if not industrial conscription, at least as, in a way, a system of indentured labour. Both steps were taken by the first Munitions of War Act, 1915. Section 4 (2) of that Act required the employer to seek the sanction of the Minister before varying rates of wages. Section 7 required a workman on munitions work to stay with his employer unless in possession of a "leaving certificate." The actual form of the prohibition was to impose a penalty on an employer who, within six weeks from a man's leaving his previous employment on munitions work, took him on without a leaving certificate. In order to provide against a misuse of the power given to the employer by this section an appeal was allowed to a workman to a special domestic court constituted by the Munitions of War Act, known as the munitions tribunal.

*Leaving Certificates.*

The measure of the efficacy of this step is illustrated in part by the fact that, with the sections controlling profits and forbidding strikes and lockouts, it was regarded by employers and workmen alike as the central provision of the new Act, and partly by the extraordinary results which followed its total repeal by the Munitions of War Act, 1917. From the day that Section 7 came into force an employer could be sure of his quota of labour, and the workman, realizing that his freedom of movement was no longer unlimited, settled down with more regularity to his work. But along with its obvious advantages this new instrument of labour regulation possessed certain obvious defects. The employer was given remarkable powers. While the workman could not leave without a certificate, the employer could dismiss without one. When with the heavy preoccupations that the war cast on employers, dismissals and engagements were often left in the hands of foremen, it will be seen how provocative of difficulty the section might be. On the one hand, from the national point of view, a workman might be out of work for six weeks when his services were urgently needed. From the workman's point of view the difficulty was more acute, since an unjustifiable dismissal without a certificate might lead to his recruitment. These were the main sources of grievance, and the complaints were bitter. The commission, consisting of Lord Balfour of Burleigh, and Mr. (afterwards Sir) Lynden Macassey, who investigated the unrest on the Clyde at the end of 1915, reported that the operation of Section 7 was in many cases harsh, and was generally one of the principal causes of labour uneasiness. They did not recommend a repeal of the provision, but were strongly in favour of amendments to make its operation less harsh. The Ministry of Munitions had concurrently arrived at the same conclusions as those submitted by this commission, and in the amending Act of 1916 effect was given to them. The three most important amendments in that Act were those requiring an employer to give a certificate in all cases of dismissal, except those of misconduct, giving the workpeople the right to demand a certificate if suspended for more than two days, and to require a week's notice or wages in lieu.

Even these amendments did not remove the growing tide of resentment against what was freely described in labour circles as the "slavery" section. The truth was that this was a measure which definitely affected the individual in his daily work, and its operation was always present to his mind. The measure was endurable in the earlier years of the war, but with the growing strain it began to have serious effects on the *moral* of the workpeople. After the May strike of 1917, commissions of inquiry, under the general chairmanship of Mr. G. N. Barnes, M.P., were set up into the causes of labour unrest. All the commissions (which reported territorially) agreed in finding that Section 7 was a potent source of trouble.

Repeal was, accordingly, decided upon, and the section disappeared with the Munitions of War Act, 1917. The result, though not what was expected, was profound. Employers had prognosticated a wholesale shifting of labour from factory to factory. This expectation was not fulfilled, but it only failed of fulfilment by reason of the action of the employers themselves in raising wages often to extravagant heights to retain workpeople. The plain fact was that with a huge shortage of labour there was no longer any economic check on wages. The provisions of Section 4 (2) of the Munitions of War Act, 1915, had in this regard been futile, and the real check had been Section 7. Its disappearance restored his bargaining power to the workman with formidable results in the variation of wages.

*Economic Check on Wages Removed.*

No subsequent action could hope to arrest the forces let loose by the abolition of the section. But as the difficulties of the position became increasingly apparent, an effort was made to meet the difficulty in 1918 by the introduction of a system of licensing of firms, known popularly as the "embargo" scheme. Under this scheme it was proposed to take advantage of the Defence of the Realm regulation already referred to, which enabled the Government to direct the methods of employment or engagement in a factory. Firms were instructed that after the receipt of the effective letter no further labour of the types scheduled was to be engaged without the licence of the Ministry of Munitions. In fact, though more than 32,000 firms were known to be engaged on munitions, by Sept. 1918 letters had been issued to only 100 firms. But the proposal was bitterly resented as an attempt to reintroduce Section 7 under a new form. It led on July 23 to a strike at Coventry which seriously threatened the production of munitions. A committee under Mr. Justice McCardie, which was set up to inquire into the circumstances of the strike, reported that the Government's scheme was justified by circumstances, though possibly the method of its introduction might have been more tactful. But the strike struck at the whole basis of the scheme, with the result that it had little effect. The only substantial contribution to the problem of the prevention of wastage had been Section 7. Nothing before or after it took its place.

(3) *Removal of Trade-Union Restrictions.*—The history of the actual introduction of "dilution"—which, of course, represented by far the most important removal of trade-union restrictions—has already been given. It is only necessary here to give an account of the negotiations which led up to the Treasury agreement of March 21 1915 (later scheduled to the Munitions of War Act, 1915) with some indications of its value.

Already by the end of 1914, both in shipyards and engineering shops, an acute shortage of labour had manifested itself. One of the methods of remedying this shortage generally recommended by employers was the removal of trade-union practices and restrictions. These practices were of four main types:—

(*a*) The practice providing that only a skilled man with certain credentials might do certain classes of work;
(*b*) the practice which distinguished sharply the allocation of skilled work as between various classes of skilled men;
(*c*) the practice which defined the hours and output permissible in given classes of work;
(*d*) the practice requiring the employment only of trade unionists in certain shops or in certain classes of work.

There were, and are, of course many variations and gradations of four main types, but these are probably predominant. There was a long and painful history behind these restrictions. They represented to the workman the entrenchments patiently established through long years of struggle against under-payment and unemployment. They were, in fact, labour's *Magna Carta*. War necessity demanded from labour its temporary repeal.

The first attempts to secure this end were made by the employers—both by ship-builders and engineers. The ship-builders had their first meeting as early as Nov. 3 1914 at York. The employers there proposed for the first time the suspension of trade-union practices and customs. The meeting had no result. Local meetings at Glasgow and Newcastle were equally fruitless, and another general meeting on Dec. 9 carried the matter no further. Later in Dec. the Admiralty intervened but without success, and the matter was reported to the Board of Trade at the end of the year almost at the same time as the equally fruitless result of the series of engineering conferences.

*Trade-Union Practices.*

The three main difficulties felt by the trade unions were:—

(*a*) The danger even in war-time of sacrificing the results of years of struggle without the most stringent guarantees that the sacrifice should be purely temporary;
(*b*) the necessity of confining the sacrifice wholly to war-work;
(*c*) the importance, even so far as war-work was concerned, of securing that private employers should not reap financial advantage from the sacrifice.

The subsequent negotiations, under the aegis first of the Board of Trade, and later of the Chancellor of the Exchequer and the President of the Board of Trade, were directed to meet these three points. As a first step letters were addressed to the A.S.E. by the War Office and the Admiralty, pointing out in general terms the need for increased labour supply. This was followed on Jan. 13 by a general conference between the Engineering Employers' Federation and the A.S.E. and kindred unions at Sheffield. This conference, like all its predecessors, was a failure.

After this breakdown Sir George (afterwards Lord) Askwith was appointed by the Board of Trade to attempt to reach a settlement. At his suggestion his single-handed efforts were supplemented by the appointment by the Prime Minister on Feb. 12 of the Committee on Production, consisting of Sir G. Askwith (chairman), Sir George Gibb, representing the War Office, and Sir Francis Hopwood (afterwards Lord Southborough), representing the Admiralty. The committee directed their attention in the first instance to the shipbuilding trade, and succeeded in making an agreement on the subject of broken time, which unhappily broke down on May 23.

*Committee on Production.*

On the greater issue, though it was ultimately necessary to bring in the Cabinet, the committee were at any rate successful in effectively preparing the ground for a settlement. In their interim report of Feb. 20 they made three principal recommendations:—

(*a*) Increased production by removal of restrictions on the manufacture of shells and fuzes with extension of the employment of female labour;
(*b*) the prevention of stoppages of work by reference of differences to an impartial tribunal to be set up by the Government;
(*c*) guarantees to be given by contracting firms and held by Government in respect of removal of restrictions.

Simultaneously, on March 5, the Engineering Employers' Federation, with the A.S.E. and kindred unions, had ultimately reached a limited agreement in a memorandum known as the Shells and Fuzes Agreement. This made the following provisions:—

(i.) It assigned certain processes definitely to skilled men, but allowed interchange of skilled men;
(ii.) it permitted the introduction of semi-skilled or female labour in suitable cases, subject to no reduction of wages;
(iii.) it insisted on restitution of pre-war practices.

A ballot taken on this among the members of the constituent unions in April was favourable, but even before the result was known the agreement had marked a long step forward on the road to the Treasury agreement. In the meantime the committee on production were negotiating further with the unions, and in their third interim report recommended immediate removal of demarcation restrictions in Government establishments, and removal in private establishments subject to safeguards akin to those provided in the Shells and Fuzes Agreement.

But in spite of the Shells and Fuzes Agreement, and the efforts of the committee on production, nothing really effective had been accomplished. Men and employers alike were waiting upon the Government. In March 1915 the Government acted. Up to this point two of the principal difficulties of the trade unions in respect to removal of restrictions had been faced—i.e. the limitation of removal to war-work, and guarantees for restitution—but the aspect of the financial position of the private employer remained to be considered. And its consideration was

vital, because the workmen were little disposed to give either their lives or their privileges in the cause of increased private profits. The committee on production were fully alive to the need not only for a dramatic gesture in this matter, but for dramatic results following upon the gesture. They recommended accordingly in their fourth report (March 5) that the Government should assume direct control of shipbuilding and armament firms, and should use this direct control radically to restrict profits. These proposals were explored, and throughout March the Board of Trade were conferring with the principal armament firms with the object, not so much of controlling their methods of manufacture, as of controlling their profits. These negotiations did not do more than place the Government in the position of announcing to the A.S.E. in the course of the negotiations for the second Treasury agreement (and embodying the announcement in the agreement) that profits would be limited. But the announcement was, in fact, the decisive factor in securing adhesion to the agreement.

***Restriction of Profits.***

In the middle of March the Government, as represented by the Chancellor of the Exchequer, the President of the Board of Trade, Mr. Montagu and Dr. Macnamara, together with Mr. Balfour as representing the Opposition, met representatives of the trade unions in full conference. The trade unions were represented by a committee under the chairmanship of Mr. Arthur Henderson, which was constituted as the result of the conference as the National Labour Advisory Committee. The negotiations started on March 17 and were concluded on March 19, and resulted in a document of such vital importance to the whole future of labour regulation that it is given in full:—

The workmen's representatives at the conference will recommend to their members the following proposals with a view to accelerating the output of munitions and equipments of war.

(1) During the war period there shall in no case be any stoppage of work upon munitions and equipments of war or other work required for a satisfactory completion of the war.

All differences on wages or conditions of employment arising out of the war shall be dealt with without stoppage in accordance with paragraph (2).

Questions not arising out of the war should not be made the cause of stoppage during the war period.

(2) Subject to any existing agreements or methods now prevailing for the settlement of disputes, differences of a purely individual or local character shall, unless mutually arranged, be the subject of a deputation to the firm representing the workmen concerned, and differences of a general character affecting wages and conditions of employment arising out of the war shall be the subject of conferences between the parties.

In all cases of failure to reach a settlement of disputes by the parties directly concerned, or their representatives, or under the existing agreements, the matter in dispute shall be dealt with under any one of the three following alternatives as may be mutually agreed, or in default of agreement, settled by the Board of Trade:

(*a*) The committee on production.

(*b*) A single arbitrator agreed upon by the parties or appointed by the Board of Trade.

(*c*) A court of arbitration upon which labour is represented equally with the employers.

(3) An advisory committee representative of the organized workers engaged in production for Government requirements shall be appointed by the Government for the purpose of facilitating the carrying out of these recommendations and for consultation by the Government or by the workmen concerned.

(4) Provided that the conditions set out in paragraph (5) are accepted by the Government as applicable to all contracts for the execution of war munitions and equipments, the workmen's representatives at the conference are of opinion that during the war period the relaxation of the present trade practices is imperative, and that each union be recommended to take into favourable consideration such changes in working conditions or trade customs as may be necessary with a view to accelerating the output of war munitions or equipments.

(5) The recommendations contained in paragraph (4) are conditional on Government requiring all contractors and sub-contractors engaged on munitions and equipments of war or other work required for the satisfactory completion of the war to give an undertaking to the following effect:—

Any departure during the war from the practice ruling in our workshops, shipyards, and other industries prior to the war, shall only be for the period of the war.

No change in practice made during the war shall be allowed to prejudice the position of the workpeople in our employment, or of their trade unions, in regard to the resumption and maintenance after the war of any rules or customs existing prior to the war.

In any readjustment of staff which may have to be effected after the war priority of employment will be given to workmen in the employment at the beginning of the war who are serving with our colours or who are now in our employment.[1]

Where the custom of a shop is changed during the war by the introduction of semi-skilled men to perform work hitherto performed by a class of workmen of higher skill, the rates paid shall be the usual rates of the district for that class of work.[2]

The relaxation of existing demarcation restrictions or admission of semi-skilled or female labour shall not affect adversely the rates customarily paid for the job. In cases where men who ordinarily do the work are adversely affected thereby, the necessary readjustments shall be made so that they can maintain their earnings.

A record of the nature of the departure from the conditions prevailing before the date of this undertaking shall be kept and shall be open for inspection by the authorized representative of the Government.

Due notice shall be given to the workmen concerned wherever practicable of any changes of working conditions which it is desired to introduce as the result of this arrangement, and opportunity of local consultation with the men or their representatives shall be given if desired.

All differences with our workmen engaged on Government work arising out of changes so introduced or with regard to wages or conditions of employment arising out of the war shall be settled without stoppage of work in accordance with the procedure laid down in paragraph (2).

It is clearly understood that except as expressly provided in the fourth paragraph of clause (5) nothing in this undertaking is to prejudice the position of employers or employees after the war.

(Signed)
D. Lloyd George.
Walter Runciman.

Arthur Henderson.
(Chairman of Workmen's Representatives.)
Wm. Mosses.
(Secretary of Workmen's Representatives.)

March 19th, 1915.

The Amalgamated Society of Engineers were not parties to this agreement, and on March 25 a further agreement was concluded with that Society which contained two additional points of first-rate importance—an undertaking by the Government to limit the profits of contractors on war work, and the limitation of the agreements to war work purely.

This was a great achievement, and equal credit is due to the members of the Government who secured it and the unions who accepted it. But the plain truth is that its acceptance by the rank and file in actual practice was not a matter of weeks but of weary months, as the account of the progress of dilution indicates. Indeed it is fair to say that the agreement had not a real chance to produce results until not merely the first Munitions Act had made the safeguards statutory and the removal of restrictions compulsory, and had limited profits, but the second Munitions Act of 1916 had provided effective powers to regulate the wages of women entrants. From that date, as has been shown elsewhere, progress began, but the Treasury agreement may well take its place among historical records of the World War as a crystallization of the deep and unswerving purpose of the ordinary British citizen to serve the nation even at the cost of his livelihood.

It should be added that throughout the war considerable uneasiness was manifested by the trade unions lest the safeguards provided by the Munitions Acts would not be adequate to secure effective restitution. Conscious of the great changes produced by the widespread introduction of the automatic machine, they feared that the changes might tend to become permanent. One step taken during the war to reassure them was the appointment of a number of officers by the Labour Department of the Ministry of Munitions to keep effective records of all departures from previous practice. The work of these officers was extremely effective, and there is no doubt that the records provided by them covered a great deal of the ground.

The existence of the records made restitution practicable. The trade unions did not rest content till what was practicable was made inevitable. Two committees were appointed in turn to consider what added safeguards were necessary—the first under the chairmanship of Sir John Simon, K.C., M.P., in 1916; the second under

[1] These three clauses are taken from the form of undertaking proposed in the Second Report of the Committee on Production.

[2] A point not provided for in this paragraph was the question whether the semi-skilled worker should also receive the guarantee (given according to the practice of some shops to the skilled worker) of his minimum time rate when he was employed on piece-work. The reason of the omission was probably that the practice was not general before the war.

the chairmanship of Sir Stephenson Kent, K.C.B., in 1918. The result of these two committees was the Act of 1919, which rigidly enforced the restitution of practices.

Perhaps it would not be unfair to say that this Act was unnecessary, and that in so far as effective safeguards were required, they were provided by the original Acts. But circumstances showed that complete restitution was in fact impracticable, and the trade unions realized that, if this were so, they were entitled to adequate compensation, which the further Act would secure for them.

(4) *Full Value for Hours Worked.*—This aspect of labour regulation may be regarded under the three main heads:—(*a*) the prevention of strikes and lockouts; (*b*) regulation of workshop discipline and hours through the Munitions Acts and particularly through munitions tribunals; and (*c*) the improvement of working conditions, under which is included the welfare work and the provision of housing.

It is not necessary here to deal with the original labour truce, the appointment of the committee on production, the provisions of the Munitions of War Acts and the Defence of the Realm Regulations, making strikes and lockouts and incitements thereto offences, and the work of the general munitions tribunals set up by the Munitions of War Acts to deal with strikers or employers guilty of lockouts. It is sufficient to say that any attempt to make a full use of available labour without regulation of strikes and lockouts is obviously doomed to failure, and therefore in so far as the methods adopted directly to prevent strikes and lockouts were successful an important aspect of labour regulation was adequately handled. But experience showed that it was not in the machinery for preventing disputes, so much as in the spirit operating among employers and workers, that the best security against industrial disputes lies. In the earliest days of the war, when the sense of national danger and of patriotism was at its highest, no machinery was devised or required. In the later years of the war, when continuous strain, disappointment, anxiety, and, above all, reflexion on what appeared to the workers were the huge profits made out of the war by employers, had strained tempers, elaborate machinery could not prevent such stoppages as the dilution strike of May 1917, or the Coventry "embargo" strike of 1918. No machinery, however perfect, can cure a disease of the spirit, and the ultimate sanction of all anti-strike legislation must be the willingness of those affected by it to accept its terms. Machinery without the right direction of labour policy, and without skilful officers in charge of the detailed working, would inevitably break down. The committee on production of itself—great and respected machine as it was—would have been ineffective but for the steady patriotism of both employers and workpeople as a whole, and for the unremitting and completely unrecognized efforts first of the Labour Department of the Board of Trade, then of the Ministry of Munitions, and finally of that Ministry, the Ministry of Labour and the Shipyard Labour Department of the Admiralty, to prove to the workers that whatever might be demanded of them was only demanded in the national interest. As prevention is better than cure, so conciliation is better than arbitration. Doctors are required, and arbitrators are vital, but it is the wise direction of policy that makes the task of the arbitrator a possible one. And, when full account is taken of the many mistakes that were made, the work of the conciliating departments played no small part in seeing that the available labour produced the munitions which won the "engineers'" war.

***Prevention of Strikes.***

The munitions tribunals were set up by the first Munitions of War Act, 1915. They represented a compromise between industrial compulsion and voluntarism. Grave complaints had been made that one of the principal causes of failure to produce the required output of munitions was the bad time-keeping both in shipyards and engineering establishments. Various causes for this were ascribed, most prominent among them being high wages and drunkenness. Acute controversy was aroused by allegations and counter-allegations, and an official enquiry was instituted in 1915, the results of which were presented in a paper laid before Parliament on May 1 1915, entitled "Report and Statistics of Bad Time Kept in Shipbuilding, Munitions and Transport Areas." The paper, though inconclusive, tended to show that, whatever the causes, there was in some areas room for improvement.

***Workshop Discipline.***

When, therefore, the first Munitions of War Act was introduced, with a general scheme for regulating labour, this aspect of the question could not be shelved. Nor could it be allowed to solve itself by the ordinary economic checks of peace-time. In peace-time the remedy for bad time-keeping, and generally of ineffective workmanship, is dismissal. With an acute shortage of labour, dismissal can only be resorted to in extreme cases. It was accordingly decided to make deliberately inefficient workmanship an offence by Section 4 (5) of the Munitions of War Act, 1915, which was as follows:—

"The employer and every person employed in the establishment shall comply with any regulations made applicable to that establishment by the Minister of Munitions with respect to the general ordering of work in the establishment with a view to attaining and maintaining a proper standard of efficiency and with respect to the due observance of the rules of the establishment.

"If the employer or any person so employed acts in contravention of, or fails to comply with, any such regulation, that employer or person shall be guilty of an offence under this Act."

The offence thus created was a new one in law, and the first point to determine was whether it should be tried in the ordinary courts. After discussion in Parliament it was decided to set up munitions tribunals (Section 15, Ministry of War Act, 1915) of two classes—known respectively as general and local tribunals—to deal with all new offences created by the Munitions of War Act and with appeals in respect of leaving certificates under Section 7. The essential features of the tribunals were:—

(i.) The fact that the independent chairman was assisted by two assessors—one employer and one workman. Originally the assessors were merely advisory, but they were made a part of the court by the Act of 1916, which also provided for a woman assessor in cases affecting women.

(ii.) The comparative informality and the cheapness of their proceedings. These two points were emphasized in the munitions tribunals' rules governing the procedure of the tribunals. These rules provided first for the exceedingly low fees, and secondly that lawyers could not appear before the local tribunals, though representatives of the workmen could.

***Munitions Tribunals.***

Like so many other of the instruments devised to meet war emergencies, the tribunals worked well, but not in the direction anticipated. It was expected in the first place that the general munitions tribunals, which were to deal with strikes and lockouts and employers' offences, would play a predominant part. The fact, however, was that except for six or seven notorious cases, such as the trial of the strikers at Fairfield's, at Glasgow, this class of tribunal rapidly receded into the background. For experience showed that actual prosecutions for the offence of striking had little result. To begin with, it was impracticable to lodge complaints against 10,000 men, and it was invidious to select among the offenders. In the second place, when imprisonment for failure to pay fines had been abolished by the Act of 1916, there was no certainty of recovery. And finally, even if recovery was possible, the individual did not suffer, since levies could always be raised to pay the fine. Indeed, so far as legal action in respect of strikes was effective it was the Defence of the Realm Act with its heavy penalties against incitement rather than the Munitions Acts that operated. But, though the general munitions tribunals were in fact little used yet none the less their existence was of great deterrent value.

So far as the local tribunals were concerned, their work in respect of workshop discipline formed in volume at any rate as time went on the lesser part of their heavy duties. They were worked hard, indeed sometimes almost overwhelmed, but their principal work consisted, so long as the leaving certificates remained, in dealing with appeals, and after their abolition with claims for failure to give notice and with questions arising upon claims for payment of wages under the orders issued by the Minister of Munitions under the powers vested in him by the Munitions Acts. So complex and difficult were these questions, and so liable to different interpretations by the fifty or sixty tribunals in existence, that it was found necessary under the Act of 1916 to provide for an appeal to the High Court in England

and to the Court of Session in Scotland. But the same principles of cheapness and informality marked the change and though the judicial decisions given had far-reaching results, they were given quickly with a minimum of expense to appellants and often without the assistance of counsel.

Section 4 (5) provided for regulations to be made by the Minister of Munitions for the general ordering of work in controlled establishments. When the bill passed into law the Minister of Munitions was faced with the difficulty of drawing up a code of workshop rules for the controlled establishments, the number of which increased from 134 on July 12 1915, to 2,422 on Jan. 1 1916, and ultimately exceeded 6,000. The difficulty of interfering with the delicate mechanism of workshop discipline by central edict was very much in the mind of the Ministry, and consequently the first regulations did not themselves make workshop rules but required the owner of a controlled establishment to post his own rules, thus giving them statutory effect.

This was an ingenious shortcut, but it failed in its object. The workmen were not prepared for possibly arbitrary rules, made to suit an employer's convenience, being made statutory. On their side the employers realized the reasonable nature of the workpeoples' objection, and moreover large numbers of the smaller employers had never drawn up a regular code of workshop rules. Accordingly in Aug. 1915 the Ministry of Munitions drew up a model code of rules for posting. These provided for regularity and diligence, suspension of restrictions, and sobriety and good order, but the model rules did not of necessity supersede the existing workshop rules. The result of this step is shown by the following figures for Dec. 4 1915, in respect of establishments controlled by Nov. 4:—

***Model Workshop Rules.***

| | *Posting of Rules.* |
|---|---|
| Model rules only | 800 |
| Model rules with variations | 21 |
| Own rules | 116 |
| Model rules and own rules | 303 |
| Model rules prepared by Engineering Employers' Federation | 64 |
| | 1,304 |

Certain difficulties arose subsequently in rules posted by employers, notably a rule imposing small fines for bad time-keeping. But these difficulties were ultimately surmounted by an agreement in the autumn of 1915 to substitute the Ministry of Munitions code for the unpopular rules.

Up to Dec. 1915 there had been 4,166 cases under Section 4 (5) before munitions tribunals, of which the great majority had been cases of bad time-keeping. It is a matter of real difficulty to decide whether convictions in this respect had or had not any real effect. It was often argued that the irritation caused by prosecutions far outweighed the advantages derived from convictions. However this may be, employers continued to revert with a certain freedom to this method, until the abolition of the leaving certificate. When this was abolished, the employer, through fear of losing workmen prosecuted, was far more chary of bringing prosecutions; indeed employers felt that the abolition of Section 7 carried with it the repeal of Section 4 (5).

The Ministry of Munitions were conscious that legal proceedings in themselves would not necessarily cure the undoubted evil of bad time-keeping, which remained throughout the war, especially in the shipyards, a real menace to production. The causes were variously diagnosed, but there can be little doubt that the real causes were overstrain and high wages. To supplement the work of the tribunals the Ministry instituted a system of warning offenders, and appointed in this connexion a number of time-keeping officers, whose duty it was to investigate the time-keeping in the various controlled establishments and to put themselves into direct touch with culprits. It is difficult to show statistically what effect this policy had, but numerous testimonies to its good effects were received from employers.

But, if no direct results could be estimated, the indirect results of the efforts to deal with time-keeping were remarkable, providing another instance of permanent changes in the social structure arising from war measures. It was clear that overstrain was one of the effective causes of bad time-keeping, and that under the general head of overstrain must be included excessive hours, and unsatisfactory workshop and housing conditions. In the effort to repair these defects an important advance was made in the direction of elevating the position of workpeople generally.

The first indirect result of the bad time-keeping campaign was the encouragement of duly authorized workshop committees, which should themselves act as judges of their fellow workpeople. In the setting up of these committees the Ministry of Munitions had to proceed very slowly, and indeed were able to do little that was effective until late in 1917. The employers regarded this innovation with the greatest suspicion. Certain advanced employers (like Hans Renold, Ltd., at Manchester, and Messrs. Rowntree) had installed them with the most favourable results. But the employers generally regarded them as an attempt by the workpeople to interfere with management, and they were the less prepared to accept them in view of the activities of the labour movement known as the "shop-steward" or "rank and file" movement. This movement, which originated with the Clyde workers' committee, advocated workshop committees, partly as a means of countering the centralized powers of the trade unions, and partly as a means of reaching workshop control. When, therefore, the Ministry of Munitions urged upon employers' committees, which in everything except name were fundamentally different from those advocated by the shop stewards, the similarity of name and the possible misuse of any powers entrusted to the committees were powerful obstacles to progress. But the Ministry persevered, and a considerable number of these committees were set up, all of which, if only for the vigorous way in which they dealt with bad time-keeping, fully justified their creation. After the Coventry strike of 1918 the Engineering Employers' Federation signed an agreement with the engineering unions setting out the basis upon which committees might be established, thus setting the seal on the labour of the Ministry of Munitions in this respect. But the point of real interest is that in this work the Ministry of Munitions anticipated in practice on a very modest scale the far-reaching proposals of the committee under Mr. J. H. Whitley, M.P., which recommended the establishment of joint industrial councils for industries.

***Improvement of Working Conditions.***

It would be untrue to allege that the control of hours, the provision of welfare facilities and the provision of housing, were undertaken primarily or indeed chiefly to cure bad time-keeping. These steps were necessary at least as much in the interests of the general *moral* of the workpeople as of the actual volume of production. But that bad time-keeping was an effective cause of the special attention given to these matters cannot be doubted. It was a consideration almost as much present to the industrial research committee, which investigated industrial fatigue, as to the Ministry of Munitions. It was certainly constantly in the mind of the welfare department of the Ministry of Munitions, and it was seriously taken into account by the Ministry in deciding on building schemes. Thus again from a war necessity were made contributions of first-rate importance to the whole future of industrial organization.

So far as hours of labour are concerned, it is sufficient here to note that the labour department of the Ministry of Munitions had a special responsibility as the labour side of the great supply department. The Home Office had the statutory duty under the Factory Acts of regulating the hours of women and young persons, but trade-union rules were the only instrument that existed to control men's hours, and then not from the health, but from the economic point of view. The Home Office, faced by the urgent demands for munitions, the validity of which they were not able to estimate, had even so far as women and young persons were concerned great difficulty in maintaining hours at a reasonable level. So far as men's hours were concerned, in the early days of the war, working weeks of 80 and 90, and even 100, hours were by no means uncommon. It was upon the labour department of the Ministry of Munitions, which could in some measure control or at least estimate the demands of the supply departments, that the duty fell of attempting to bring hours down to a reasonable level. It was the Medical Research Committee, constituted by the Home Office, which pointed out the waste of energy and efficiency involved by excessive hours, but it was the labour department of the Ministry of Munitions which, by using their influence with the supply departments, were able to see that the views of the committee were carried out at least in part.

So far as welfare is concerned, here again the Ministry of Munitions

came in as the supply department, which, by reason of its intimate association with employers, could effectively supplement the statutory duties of the Home Office. It is doubtful how far the Ministry had any statutory basis for the important duties they discharged in this direction. But they had a power greater perhaps even than that of statute—the power of the purse. When the Department urged upon employers the provision of suitable canteens, rest-rooms and welfare superintendents, they could hope that their recommendations would be (as they generally were) accepted because they had power to write off the firms' expenditure in this respect against excess profits. But here again the interesting point that emerges is that the experiment of the Ministry of Munitions for meeting a war need has profoundly affected the attitude of employers generally to these problems.

Finally, so far as housing is concerned, the first point of interest is that by assuming direct responsibility for the provision of houses, the Ministry foreshadowed or perhaps even pointed the way to the great responsibility for the general housing of the population assumed after the war by the Ministry of Health. The State had admitted that for certain war purposes it had obligations in respect of housing; it was difficult to deny these obligations in the face of the even more clamant demands of peace.

Before leaving the subject of housing, a brief reference should be made to the Billeting of Civilians Act of 1917. When it became apparent that housing difficulties were proving a real obstacle to the production of munitions, and that it was hopeless to expect that new houses could be built in time to meet the need, the Government decided on the drastic step of introducing an Act, under which they took power to billet munitions workers compulsorily, if adequate accommodation were not forthcoming. A central billeting board was set up to carry the Act into effect, and billeting officers were appointed. In fact, the principal value of the Act proved to be the threat of compulsion. In place of making orders, the general procedure was to hold conferences in the most congested districts, which generally resulted in the provision of increased accommodation without the need of a resort to compulsion. Though figures could not easily be obtained to support the view it is probable that the Act had a considerable success.

(5) *The Handling of Wages Problem.*—Any account of labour regulation would be incomplete which did not indicate the degree to which success or failure in handling the wages problem may affect the whole labour situation. During the war, wages did not have quite so predominant a share in moulding the point of view of workmen to industrial questions as during peace. Questions such as dilution, and compulsory military service, took their place side by side with wages as topics of first-class importance to labour. But none the less a failure to deal with wages would have constituted a failure to regulate labour. Clear above all the conflicting considerations that remain when the general Government policy is considered there stand out the two great experiments in handling wages—(*a*) compulsory arbitration, and (*b*) fixing of wages by administrative orders.

Compulsory arbitration had long formed the subject of controversy, and had long been repudiated by labour opinion, on the plain ground that such arbitration necessarily destroyed the right to strike. Labour opinion, though fully conscious of the economic wastefulness of this desperate resort, regarded it none the less as the *ultima ratio*. The right to resort to it had been finally consecrated by the Trade Disputes Act of 1906, and any interference with or reduction of the extreme right was regarded as a vital attack on the general liberties of labour. But the war proved in the end too strong even for this view. For the first few months, in the general engineering and shipbuilding trades, wages did not play any very considerable part. Overtime to an unheard-of extent was being worked, and unemployment was non-existent for any man who cared to work; so that rates of wages could safely be left to look after themselves. But as the shortage of labour grew more and more pronounced, a sharp change came over the situation. Employers began to bid against one another; and disparities between one factory and another, and between one district and another, began to have an effect on the minds of the workpeople. Moreover, at the beginning of 1915 an old-standing difficulty between employers and employed in the Clyde reëmerged, and the atmosphere began to be charged with a certain liveliness. But over and above this there was a genuine reluctance among workpeople to put themselves in the position of striking, and thus ceasing to produce the munitions of which their brothers in the field were so urgently in want. It was principally this factor, though the others were also material, that made it possible, when the Treasury agreement forbidding strikes and lockouts was concluded, to couple with that provision the institution of arbitration, which by the Munitions of War Act, 1915, became compulsory.

*Compulsory Arbitration.*

It cannot be pretended that at any time the strongly organized part of the labour world welcomed or approved of compulsory arbitration, but equally it cannot be denied that the principle was legally accepted. The statistics of strikes and lockouts during the war period indeed show that the principle was by no means universally accepted, but in weighing the statistics account must be taken of the fact that all the most considerable strikes were unconnected with wages. But, even allowing for a considerable body of strikes on wages and even against decisions of the compulsory tribunals, the experiment must be considered to have been successful. It is therefore the more surprising that labour opinion should have been so little converted to its use.

The reasons for this are not far to seek. In the first place it is one thing to abandon the strike weapon during war, when it operates as much against the strikers as against the employers. It is quite another thing to abandon or even to restrict its use during peace. In the second place, from the labour point of view, compulsory arbitration during a period of acute labour shortage and rising prices resolved itself into a question of determining only how much wages should be advanced, and never how much they should be reduced. And finally there existed the order-making powers of the Ministry of Munitions, which could be, and indeed constantly were, resorted to, as an alternative to, and as a means of evading, compulsory arbitration.

On the general effect of compulsory arbitration it may fairly be said that, though its compulsory character was abandoned with the termination of the war except in so far as it was kept alive for a strictly limited period by the Wages (Temporary Regulation) Acts, it had familiarized great masses of workpeople to the principle of arbitration, whether compulsory or not. In this way, by pointing to a central settlement of labour questions without resort to industrial warfare, the system of compulsory arbitration has had enduring effects.

*Orders of the Ministry of Munitions.*

Side by side with the awards of the arbitration tribunals, and only too often conflicting with them, there came into existence the direct power of the Ministry of Munitions to make orders. As between awards and orders it is sufficient to say here that, while there is a great deal to be said for orders, whether direct or through a trade organization, in respect of unorganized trades, it is difficult in theory to defend orders in respect of organized trades. But theory in war-time has a habit of being ineffective. The critics who point scornfully to what they regard as the disaster of the repeal of Section 7 and the granting of the 12½% bonus, have this advantage over those responsible for these measures. They see what happened as a result of their introduction: they do not, however, see what was avoided. They are therefore ready to assume that the difficulties avoided are negligible in comparison with those created. Nothing can controvert them, except possibly the fact that in spite, it may even be as a result, of measures such as these in face of unspeakable strain and anxiety, the working classes remained resolutely, loyally, and with but trifling interruptions, at work till Nov. 11 1918.

The origin of the order-making power is to be found in the prosecution of the Government's proposals for dilution. The principal stumbling block at the end of 1915 was the fear that the introduction of semi-skilled men and women upon work hitherto performed by skilled men would depress the level of the wages. The trade unions demanded that the Government should take powers to prevent that depression. These powers were taken under Sections 6, 7 and 8 of the Munitions of War Act, 1916, which enabled the Minister of Munitions (1) to make orders concerning the wages, hours of labour and conditions of employment, (*a*) of women employed on munitions work in establishments subject to the provisions of Section 7 of the principal Act, and (*b*) of certain classes of semi-skilled and unskilled men employed in controlled establishments; and also (2) to constitute

special arbitration tribunals, (*a*) to deal with differences in the matters mentioned above, and (*b*) to advise the Minister on questions referred to them affecting such matters.

This order-making power was assumed by the Minister of Munitions as an indispensable preliminary to securing dilution. It is important to note that the orders, so far as women were concerned, were of two classes: the first, and for this purpose the less important, were those which dealt with women engaged on what was previously men's work; the second with women on women's work. These orders, dealing as they did with practically unorganized trades, for the first time in general industry, introduced an effective underpinning minimum. The first order fixed 20s. per week as the minimum, representing in itself a 6s. to 8s. advance over the average wage previously enjoyed by women in industry. From that time, with the steadily increasing cost of living, the women's rate mounted steadily till it reached the neighbourhood of 35s. There are those who maintain that these last rates were excessive. There are none, however, who dare pretend that the pre-war level was adequate. The action of the Ministry of Munitions had destroyed the old standards, which never returned, for the Wages (Temporary Regulation) Acts, temporarily, and the Trade Board Act, 1918, permanently, stepped in to uphold the standard thus fixed. When, therefore, the wages policy of the Government is criticised, it is only fair to remember that the women's wages orders of the Ministry of Munitions opened a new era in women's employment.

But, if these orders can be defended, it will be more difficult to find those who would accept a defence of the order giving the 12½% bonus in the autumn of 1917. Yet when this order is criticised, the stages that led up to it should be remembered. The introduction of the automatic machine and mass production had afforded unprecedentedly high wages to semi-skilled and unskilled workers employed on piece-work. Side by side with those working on operations which, because of their delicacy, could not be performed on a piece-work basis, were the skilled men, whose wages had by no means advanced at an equal rate. Not only, therefore, had the relative wage superiority of the skilled man not been maintained, but in many cases the less skilled worker—who had often been taught by the skilled man—was receiving a higher wage than his teacher. This grievance—which was generally known as the skilled man's grievance—had been noticed by all the commissions on industrial unrest appointed after the May strike of 1917 under the general chairmanship of Mr. Barnes. They were unanimous in declaring that it should be remedied, but not unanimous as to the means. The 12½% bonus given on the advice of the labour side of a mixed committee appointed to consider the matters was the means adopted by the Government. Designed to remove the disparity between skilled and unskilled, it was ultimately extended to time and piece-workers skilled and unskilled alike. It is clear that it did not achieve its object of removing the disparity; that it was extremely expensive, and that during the days when it was first imposed it led to much confusion and grave irritation. But what is not clear is whether, if it had not been granted as an earnest proof of the Government's sincere determination to remedy a labour grievance, other troubles of a deeper and more formidable sort, of which angry signs had already appeared, might not have developed. Admittedly, only an acute emergency could justify the attempt to regulate the general wages of the country by central order. (H. We.)

## II. United States

Before the World War there was no national American system of labour placement. There were thousands of employment agencies of every type (commercial fee-charging agencies, philanthropic offices, union, employers' and commercial association offices, Federal, state and municipal agencies), competing, duplicating and working at cross purposes. War-time demands for labour soon overstrained the existing facilities. The flow of immigrants stopped; the draft drew off large numbers of men; war industries bid against each other in competition for workers; there was little contraction of non-essential industries. By the spring of 1918 the surplus had been absorbed, and war labour needs had reached the total of 3,928,956 workers. The problem was one both of distribution and training. To meet the war emergency, the U.S. Employment Service and the U.S. Training and Dilution Service were established.

The first plan to establish a Federal employment service was inaugurated by the Bureau of Immigration in 1907 for the purpose of placing immigrants on farms. In Jan. 1915 it was extended to cover all occupations and all classes of workers, and effort was made to coöperate with state bureaus. A special division of "reserves" (public service reserves and boys' working reserve) was created to enroll skilled workers and to enlist boys between 16 and 21 for vacation work. In Jan. 1918 the Secretary of Labor ordered the separation of the employment service from the bureau of immigration and a few months later when the Department of Labor was reorganized, the United States Employment Service was made one of its eight new divisions. Two million dollars was granted to it from the President's emergency fund.

The service passed through several stages of reorganization. In its final form it consisted of five divisions:—(1) the control division, which was in charge of general correspondence, statistics and research, expenditures and accounts; (2) the field organization division, which supervised the employment offices; (3) the clearance division, which handled reports on labour supply and distributed unfilled requests for help; (4) the personnel division, which dealt with the selection and training of help and worked out standard classifica ions of occupations; and (5) the information division, which published the *U.S. Employment Service Bulletin* and had charge of all publicity work. Responsibility for organization was centred in a Federal director in each state. State advisory boards, consisting of representative employers and workers, were organized, as well as community labour boards. Dependence of employers on the service was further increased when, on Aug. 1 1918, by Presidential proclamation, all employers engaged in war industries, who employed more than 100 persons, were required to hire their unskilled labourers through the service. By Oct. 1918, 832 offices had been opened, covering every state, the District of Columbia and Porto Rico. Special divisions were organized for woman labour, railway labour, farm labour, shipyard labour, longshoremen, negro labour, mine labour and engineers.

Following the cessation of hostilities a plan was worked out for the placement of ex-soldiers and war workers. Lack of adequate funds, however, forced the service to curtail its work, and by Oct. 1919 all of the offices were closed except those which the states and municipalities took over. These were granted a small sum of money and remained in coöperation with the Federal office. During the period from Oct. 11 1919 to June 30 1920, 269 such offices were in operation in 41 states and the District of Columbia, supported mostly by state and municipal funds.

Though the service had many weaknesses and shortcomings, due mainly to the fact that it was created under pressure to relieve a disorganized labour market, it accomplished remarkable results, as the following table shows:—

Activities of the U.S. Employment Service and coöperating Public Employment Offices, Jan. 1918 to June 1920, inclusive.

| | Help Wanted | Registrations | Referred to Positions | Placements Number | Per cent of Registrations |
|---|---|---|---|---|---|
| 1918 | 8,929,095 | 4,225,451 | 3,969,579 | 3,091,821 | 73·2 |
| 1919 | 4,857,264 | 4,367,190 | 3,807,448 | 2,920,839 | 66·9 |
| 1920 (6 mos.) | 1,496,819 | 1,138,773 | 1,152,162 | 833,368 | 73·1 |

Credit for its success must be given, also, to some of the well-organized state services which had existed for several years.

As in other countries during the war, the labour shortage was overcome in part by the increased employment of women, who entered industry in large numbers, particularly after the second draft. In a study recently made from Ohio statistics, it has been shown that there was no marked increase of employers' demands for women until March 1918, but that from then to

March 1919 there was a much stronger demand for women workers than before the war. In fact, just before the termination of the war, employers were asking for twice as many women workers as in 1917. The figures show, also, that the number of women seeking industrial employment rose in almost exact proportion to the demand for their services. In another study, made for the country as a whole, of 15,000 firms employing 2,500,000 workers, it is estimated that in 1914 6·5% of the workers on the labour force of leading war agency and implement industries were women; in 1916 7·7% were women; after the first draft (Feb.–March 1918) 10·6% were women; after the second draft (Oct.–Nov. 1918) 13·9% were women. In Aug. 1919 women still remained as 10% of the labour force. In the production of munitions, Benedict Crowell, Assistant Secretary of War and Director of Munitions, says that the women played a "highly important part." Fifty per cent of the employees in explosive plants were women; in the manufacture of hand grenades 19 out of 20 workers were women; in the Government gas-mask defence plant 8,500 out of 12,000 employees were women. In transportation the highest employment of women was reached in Oct. 1918, when there were 101,785 employed by first-class roads, an increase of 66% in the first nine months of 1918 and of 225% from the beginning of the war. In Oct. 1919 the number had fallen to 81,803. This increase in the war industries was secured in part by the absolute increase in numbers of women employed and in part by a shift from the traditional occupations of women in the textile, garment, food and tobacco industries which showed in some instances actual decrease in the numbers employed.

Women were first substituted for men in hundreds of repetitive occupations, and in unskilled and labouring jobs, in industries varying in their main divisions from blast furnaces to lumber camps. More important for the future was the fact that the war emergency in some cases opened the way to the "master machines" and key occupations. In all the industries taken together where women were substituted, 98 to 100 men were released for every 100 women employed, though there were exceptions such as crane operating where three women on 8-hour shifts replaced two men on 12-hour shifts. With regard to the success of their work in the new occupations a recent study of representative firms where women were substituted for men shows that 77·4% of the firms investigated reported that women's work, where comparable, was as satisfactory as, or better than, that of men. On the whole the results of their work seemed to depend less on the kind of work or degree of skill required than upon the intelligence with which they were initiated into their new work.

To meet the demand for technically skilled labour, the training and dilution service of the Department of Labor was organized, July 16 1918, under the authority of the War Labor Administration Act, and $150,000 was appropriated for its use. Its particular function was to ascertain the best methods of training workers and to provide information. Plans for factory training were designed, the various types of training were classified, and information was widely disseminated among employers. Especially was training needed for women, who were, with few exceptions, unprepared for the skilled and semi-skilled work. This was usually given in the factory training-room or vestibule school. Though the life of the service was so brief that it had no appreciable effect in augmenting the supply of skilled labour, it accomplished an important result in emphasizing the need for industrial training.

**LABRADOR.** (*see* 16.28).—Developments in Labrador during the decade 1910–20 were comparatively few and unimportant. The Newfoundland fishermen pursued their calling along its seaboard, and wireless stations were established at several points there to render communication easier. The work of the Grenfell mission among the fishermen was maintained and extended, and farther N. the Moravian missionaries continued their Christianizing work among the Eskimos, originated more than a century ago. The Hudson's Bay Co. and its more recent rival, the Revillon Co., kept up contact with the trappers on the coast and the Indian tribes of the wilderness behind, and occasional American exploring parties, geologists and others, visited the region during the summer seasons. The epidemic of influenza in 1918 ravaged the northern section despite the efforts of the Moravian missionaries and their medical staff; 20% of the natives perished. The mortality in some settlements was such that the dead had to be buried in pits, through lack of help to dig individual graves.

Labrador contributed a substantial quota of men—whites and half-breeds—for the Newfoundland Regiment and Naval Reserve, and even the smallest settlements helped in raising funds for Red Cross and other patriotic purposes. During the World War the attitude of some of the Moravian missionaries of German descent resulted in steps being taken for their internment. Other safeguards were applied and patrols were maintained by the Newfoundland Government during two seasons in case German submarines should use the coast to operate against Allied shipping passing through Belle Isle Strait to leave or reach Canadian harbours.

The production of codfish, salmon, trout and peltries, the principal yield of the region, continued about normal, but a survey of the seaboard and a thorough investigation of the fishery possibilities of the outer waters, which the Newfoundland Government had in contemplation, should result in largely increasing the magnitude of the fishing industry. Conditions on the eastern coast of "Newfoundland" Labrador, as it is known, are virtually identical with those on the western coast or "Canadian" Labrador from Belle Isle Strait westward to the St. Lawrence. The Grenfell mission operates here also but to a smaller extent than on the Atlantic seaboard, while the Canadian church organizations, Protestant and Catholic, play a larger part in caring for the natives there than the very limited resources of the kindred organizations in Newfoundland permit of their doing on the ocean front.

In Nov. 1920, after several years of negotiation, the Canadian and Newfoundland Governments, through their respective Ministers of Justice, signed an agreement in London for the submission to the Privy Council of the question of the Labrador boundary, on which depends, amongst other things, the right to valuable timber and mineral areas in that region. Broadly speaking, Newfoundland claims that her jurisdiction should extend inland from the Atlantic coast to the watershed or "height of land" in the interior, and that she should possess all the territory draining into the Atlantic; while Canada claims that the whole of this territory should be hers except a narrow strip along the seaboard necessary to enable the Newfoundlanders to carry on successfully their fishing enterprise, which is at present the only substantial industry in the region.

**LADENBURG, ALBERT** (1842–1911), German chemist, was born at Mannheim July 2 1842. He was educated at a Real-gymnasium at Mannheim and after the age of 15 at the technical school of Karlsruhe, proceeding to the university of Heidelberg, where he graduated as doctor of philosophy (1863). From 1863 to 1867 he first studied organic chemistry under A. Kekulé at Ghent, then visited England, studied in Paris and with Ch. Friedel and Wurtz, and returned to teach at Heidelberg. In 1873 he went to Kiel as professor of chemistry and director of the laboratory, remaining there until 1889 when he went to the university of Breslau in the same capacity. He was made an honorary member of the Pharmaceutical Society of Great Britain in 1886 and received the Hanbury medal for original research in chemistry in 1889. Details of his work, especially in connexion with benzene derivatives, are given in 6.53, 55 and 942; 11.215; 20.430; 25.892 and 21.635. He published *Entwicklungsgeschichte der Chemie von Lavoisier bis zur Gegenwart* (1869) and other works on chemistry, collaborated in a *Handwörterbuch der Chemie* (15 vols., 1882–98), and wrote a volume of reminiscences, *Lebenserinnerungen* (1912). He died at Breslau Aug. 15 1911.

See *Biographisches Jahrbuch und Deutscher Nekrolog*, Bd. xvii. 172 (1914), and W. Hera's *Albert Ladenburg*.

**LA FOLLETTE, ROBERT MARION** (1855– ), American politician, was born on a farm in Primrose township, Dane co., Wis., June 14 1855. He graduated from the university of Wisconsin in 1879, studied law there for one term, and was admitted to the bar in 1880. He began immediately to practise in Madison and served as district attorney for Dane co. for two terms (1880–4). From 1885 to 1891 he was a representative in Congress, and, as a member of the Ways and Means Committee, helped to draft the McKinley Tariff bill. On being defeated for Congress in 1891 he returned to practise in Madison. In 1896 he was a delegate to the Republican National Convention. He was elected governor of Wisconsin in 1901 and was re-elected in 1903 and 1905. It was largely due to him that state laws were passed for taxing railways according to valuation (1903), for nominating all candidates for public office by direct vote of the people (1904), and for regulating the railways in the state through a state commission (1905). He resigned the governorship in 1905 on being elected to the U.S. Senate, and was re-elected for two succeeding terms. He was an unsuccessful candidate for the presidential nomination at the Republican National Convention in 1908. In 1915 he was sponsor in the Senate for the seamen's bill providing for better working conditions and increase of life-saving equipment on board ship. He favoured, in 1916, an embargo on the shipment of arms from America, but supported armed intervention in Mexico. After America's entrance into the World War he was a pronounced and conspicuous pacifist.

He was the author of *La Follette's Autobiography* (1913).

**LAGERLÖF, SELMA** (1858– ), Swedish writer, was born Nov. 20 1858 at Mårbacke in Värmland (Vermland). She grew up among country surroundings in a province in which tradition and folk-lore survived to an extent unknown elsewhere in the land. After going through the course in the Royal Women's Superior Training College of Stockholm, she became a teacher in the girls' high school at Landskrona. A weekly journal offered a prize for competition. She sent in some chapters of her first work, *Gösta Berlings Saga*, and won the prize. Thus began her public career as author. The book was a collection of tales, each to some extent independent of the others, gathered together in one framework: wild and moving scenes from Värmland life, depicted with lively imagination in a style of diction in keeping with her subject. The book is peculiarly Swedish in its character but it has been translated into English, Danish, German, Finnish, French, Dutch, Italian, Spanish, Hungarian, Portuguese, Czech and Russian. In 1894 she published *Osynliga Länkar* (*Invisible Links*).

In 1895 she was able to give up her work as teacher. Two journeys abroad which she now made, one of them to Italy, the other to Palestine and other parts of the East, were largely instrumental in providing material for her next book. In *Antikrists Mirakler* (1897) she gives a picture, in legendary shape, of the mystical and socialistic aspects of Sicilian life. In *Jerusalem* (1901–2) she tells of a strange flitting from the Swedish province of Dalarne to the Holy Land. Among her other works may be mentioned *Drottningar i Kungahälla*, stories from Swedish history (1899); *En Herrgårdssägen* (1899); *Kristuslegender* (1904); *Herr Arnes Penningar* (1904); *Nils Holgerssons Underbara Resa* (1906–7), a book for children, recounting a small boy's remarkable adventures on a journey through Sweden on the back of a wild-goose, embodying at the same time a series of stories touching on Swedish nature and history; *En Saga om en Saga* (1908); *Liljecronas Hem* (1911); *Körkarlen* (1912); *Dunungen*, a comedy (1914); *Kejsarn av Portugallien* (1914); *Troll och Människor* (1915); *Bannlyst* (1918) and *Kavaljersmycket* (1918); as well as a volume of essays entitled *Hem och Stat*, published in 1911. Most of her books have been translated into English and other languages.

Honours and marks of esteem began gradually to come to her. In 1907 she was given a doctor's degree by Upsala University; in 1909 the Swedish Academy awarded her the Nobel prize for literature, and subsequently she was elected one of its 18 members—the first woman to be elected since its foundation in the 18th century. She purchased and restored the old farm in Värmland which was the home of her fathers.

See M. Kristenson, *Selma Lagerlöf* (1917); O. I. Levertin, *Selma Lagerlöf* (1904).

**LAGOS** (*see* 16.74), the principal port and the administrative capital of the colony and protectorate of Nigeria. The name was formerly borne also by the Crown colony of Lagos, an area of approximately 1,400 sq. m., adjoining the protectorate of Nigeria, of which the area is some 334,300 sq. m. in extent. The principal residence of the governor of Nigeria is at Lagos, and the colony possesses a Legislative Council, the authority of which extends only to the area enclosed within its boundaries. The town and island are linked to Iddo I., on which the terminus of the railway to Kano is situated, by Carter bridge; and Iddo I. is, in its turn, joined to the mainland by Denton bridge.

Extensive wharves were in 1921 about to be constructed by Messrs. Armstrong at Apapa, on the side of the lagoon facing the town, and a large electrical power-station to work the cranes on these wharves and to supply power to the main railway-workshops, which are under construction on the mainland beyond Denton bridge, was being built on Iddo I. to supplement the smaller power-station by which the town is at present lighted. Under the administration of Sir Walter Egerton fine waterworks were constructed at Ijau, on the mainland, which furnish an abundant supply of potable water to the town and its environs. Extensive harbour-works, still in progress in 1921, had already done much to improve the port, and these, aided by dredging, enable ships of approximately 20-ft. draft to enter the harbour and to lie alongside the customs wharf. It was hoped that the works in hand would eventually enable ships drawing 32 ft. to make use of the port. Lagos is the outlet and inlet of all the trade of that part of Nigeria served by the Iddo-Kano railway, which is 705 m. in length, and it has also a considerable canoe-borne trade with the adjacent portions of the Southern Provinces of Nigeria.

**LAGUERRE, JEAN HENRI GEORGES** (1858–1912), French lawyer and politician (*see* 16.79), died June 17 1912.

**LAISANT, CHARLES ANNE** (1841–1920), French politician (*see* 16.84), died at Asnières, near Paris, May 5 1920.

**LAKING, SIR FRANCIS HENRY, 1ST BART.** (1847–1914), English physician, was born in Kensington Jan. 9 1847. He was educated at Heidelberg, and afterwards studied medicine at St. George's hospital, taking his degree of M.D. in 1869. He was for many years one of the physicians to the royal household, and was appointed physician-in-ordinary to King Edward VII. in 1901. He was knighted in 1893, created a baronet in 1902, G.C.V.O. in 1903, and K.C.B. in 1910. He died in London May 21 1914.

His son, SIR GUY FRANCIS LAKING, 2ND BART. (1875–1919), English antiquary, was born in London Oct. 21 1875. He was educated at Westminster school, and later studied art, but instead of adopting this as a career he entered Christie's, art dealers, where his apprenticeship stimulated all his antiquarian tastes. He was an enthusiastic student of armour, and this led to his appointment by King Edward VII. as keeper of the king's armoury, and also to his being appointed hon. inspector of the armouries of the Wallace collection (1900). He was also responsible for the arrangement of the London museum (1914). Sir Guy Laking published the following works: *The Armoury at Windsor Castle* (1904); *The Armoury of the Knights of St. John* (1905); *The Furniture of Windsor Castle* (1905) and *The Sèvres Porcelain of Buckingham Palace* (1907), besides a *catalogue raisonné* of the armour at Hertford House. He died in London Nov. 22 1919.

**LAMMASCH, HEINRICH** (1853–1920), Austrian jurist and statesman, was born on May 18 1853. He was professor of criminal and international law, a member of the Hague Arbitration Tribunal, and in 1918 the last prime minister of Austria. He qualified for the teaching faculty at Vienna in 1878. His pioneer pamphlet on the objective danger in the conception of attempted crime won for him in 1882 an extraordinary professorship, and in 1885 a full professorship at Innsbruck. In 1889 he returned to Vienna and there became an advocate of the idea of a league of nations in the spirit of Christian philosophy. He became an international arbitrator, and arranged the Newfoundland dispute between Great Britain and the United States

and the Orinoco dispute between the latter and Venezuela. He was sent to represent Austria at St. Germain, returned broken in body and spirit, and died shortly afterwards, on Jan. 6 1920.

(C. Br.)

**LAMONT, THOMAS WILLIAM** (1870– ), American banker, was born at Claverack, N.Y., Sept. 30 1870. He was educated at Phillips Academy, Exeter, N.H., and at Harvard (A.B. 1892). After graduation he was for two years on the editorial staff of the *New York Tribune;* then for some years was actively engaged in the manufacturing and mercantile business of Lamont, Corliss & Co. From 1903 to 1909 he was connected with the Bankers Trust Company, in New York, first as secretary and treasurer, and, after 1905, as vice-president. In 1909 he was elected vice-president of the First National Bank of New York City, serving for two years. On Jan. 1 1911 he entered the firm of J. P. Morgan & Co. In 1912 he was elected a member of the board of overseers of Harvard College and in 1915 president of the Associated Harvard Clubs. He was active in raising additional endowment for the Harvard School of Business Administration, in which he was specially interested. He took an active part in floating the British, French and Russian loans in America during the World War. In 1918–22 he was proprietor of the *New York Evening Post.* In 1919 he was financial and economic adviser of the American delegation to the Peace Conference in Paris, and was U.S. delegate in the formation of the new Consortium, composed of American, British, French and Japanese bankers, for aiding Chinese industries and railways; in 1920 he visited China as the representative of the American group, and in 1921 he was chairman of the American Committee for the China Famine Fund.

**LANCIANI, RODOLFO** (1846– ), Italian architect and archaeologist, was born at Rome Jan. 1 1846. Educated at the Collegio Romano and the university of Rome, he became professor of ancient topography at that university in 1878. In 1872 he had been appointed secretary to the Archaeological Commission (of Rome), in 1876 vice-director of the Kircherian museum and in 1878 director of excavations. He was the designer and builder of the archaeological park at Rome. The recipient of hon. degrees from many universities, English, American and European, he was made a member of numerous archaeological and similar societies, including the Royal Institute of British Architects, who bestowed on him their gold medal. He became a senator of the kingdom of Italy. In 1920 he married Princess Caracciolo Colonna. Among his books are *Golden Days of the Renaissance in Rome* (1906); and *Wanderings in the Roman Campagna* (1909).

**LANE, FRANKLIN KNIGHT** (1864–1921), American public official, was born near Charlottetown, P.E.I., Canada, July 15 1864. He was taken to California in childhood and graduated from the university of California in 1886. He began his career as a newspaper reporter, studied law, and was admitted to the bar in 1889. He practised in San Francisco, drafted a charter for that city, and soon afterwards, in 1897, was elected city attorney, to which office he was twice reelected. In 1902 he was the unsuccessful Democratic candidate for governor of California and the following year received the Democratic vote of the state legislature for the U.S. Senate, but failed of election. In 1905 he was appointed by President Roosevelt a member of the Interstate Commerce Commission and was retained by President Taft, serving for eight years, part of the time as chairman. The decisions which he wrote, many of which were regarded as radical at the time, were all upheld by the courts. In 1913 he entered the Cabinet of President Wilson as Secretary of the Interior. During his term of office the wealth of Alaska was made more accessible by the construction of a Government railway. Dams were built in several western states for conserving the water-supply in dry regions. To the Indians he gave special attention, maintaining that perpetual tutelage was wrong. Long before, authority had been granted the Secretary of the Interior to deal with individual cases, and by a generous interpretation of his powers many Indians were made free citizens. In connexion with national resources he advocated development without waste as being seasonable conservation. He was an earnest advocate of reclamation of land, and suggested that farms for soldiers returned from the World War could be provided by extensive drainage and irrigation. He favoured a policy of Americanization for the foreign population and the education of illiterates. In 1916 he was a member of the American-Mexican Joint High Commission, and the following year became a member of the Council of National Defense. In 1920 he resigned his post as Secretary of the Interior. He was treasurer of the European Relief Council. He died at Rochester, Minn., May 18 1921. He was the author of *The American Spirit* (1918, addresses delivered in war time).

**LANE, SIR HUGH PERCY** (1875–1915), Irish art collector and critic, was born in co. Cork Nov. 9 1875, the son of the Rev. J. W. Lane. His mother was a daughter of Dudley Persse, of Roxburgh, co. Galway, and a sister of Lady Gregory, the Irish playwright. Hugh Lane entered the firm of Colnaghi & Co. in 1893, and he rapidly made a name as a gifted connoisseur and collector of extraordinary perception. In 1898 he began dealing on his own account at 2, Pall Mall Place. He took a prominent part in the revival of an interest in art in Ireland, and was especially enthusiastic in the matter of establishing a gallery of modern art in Dublin. With the object of interesting the general public in this idea, an exhibition was held at the Guildhall in 1904 of works by artists of Irish birth, and exhibitions of modern art were subsequently held in Dublin and Belfast, with the object of raising money for the purchase of pictures for Dublin. A fine collection was ultimately made, and housed in Harcourt Street, Dublin, where it was opened in 1906. Sir Hugh Lane, who was knighted in 1909, also offered a number of his own splendid purchases of old masters to the city of Dublin on condition that a suitable building be provided for housing them, but, owing to the attitude adopted on the subject by the Dublin Corporation, his gift did not take effect. He acted as adviser on the formation of the Johannesburg Municipal Gallery of modern art founded by Lady Phillips (1909), and brought together the Cape Town National Gallery collection of 17th-century Dutch pictures (1912). He was in 1914 appointed director of the National Gallery of Ireland. In the early months of 1915 he paid a visit to America, and sold two of his most important pictures (Titian's "Man in the Red Cap" and Holbein's "Portrait of Thomas Cromwell") to American collectors. He returned to England on the "Lusitania," and was drowned in the sinking of that ship May 7 1915, one of his last acts having been to secure by telegram for £10,000 the blank canvas contributed by J. S. Sargent to a Red Cross sale at Christie's.

Sir Hugh Lane left a considerable fortune and also a splendid collection of pictures, including fine examples of Gainsborough, Goya and Rembrandt. Most of these were left to the National Gallery of Ireland, but a certain number came to the English National Gallery. Owing to an informality in the drawing up of a codicil to the will, which had been signed but not witnessed, it was the occasion of controversy. It was contended that Sir Hugh Lane had altered his intention of bequeathing some of his pictures to the English National Gallery, and that the entire bequest was thus the property of the Irish National Gallery. The court, however, decided otherwise.

See *The Life and Achievements of Hugh Lane: with some account of the Dublin Galleries*, by Lady Gregory (1920).

**LANESSAN, JEAN MARIE ANTOINE DE** (1843–1919), French statesman and naturalist (*see* 16.169). At the elections of 1914 he was again, as in 1906, not returned, and he retired definitely from politics. Among his latest works were *La Crise de la République; Introduction à la Guerre de 1914* and *l'Histoire de l'Entente Cordiale Anglo-Française*, of which he was an ardent admirer. He died at Ecouen, Seine-et-Oise, Nov. 7 1919.

**LANG, ANDREW** (1844–1912), English writer (*see* 16.172), died at Banchory, Aberdeenshire, July 20 1912.

**LANG, COSMO GORDON** (1864– ), Archbishop of York, was born Oct. 31 1864 at Aberdeen, son of John Marshall Lang, sometime moderator of the Church of Scotland, and educated at Glasgow University until 1882, when he won a scholarship at Balliol College, Oxford. He took his degree in 1886, becoming

fellow of All Souls in 1888. From 1883 to 1889 he was a student of the Inner Temple, but abandoned law for the church and was ordained curate of Leeds parish church in 1890. He was fellow and dean of divinity at Magdalen College, Oxford, from 1893 to 1896, and at the same time vicar of the university church of St. Mary's. In 1896 he became vicar of Portsea, when his success in administering a large working-class parish led in 1901 to his nomination as bishop suffragan of Stepney in the East End of London. In 1908 he was made Archbishop of York. The confirmation of his appointment was formally opposed on ritualistic grounds by the Protestant Truth Society (*see* 6.907). He was hon. chaplain to, and a personal friend of, Queen Victoria, and published several religious books, notably *The Miracles of Jesus as Marks of the Way of Life* (1900) and *The Opportunity of the Church of England* (1906). He was a member of the royal commission appointed in 1909 to inquire into the law of divorce, and with Sir Lewis Dibdin and Sir William Anson signed the minority report. As Archbishop of the Northern Province he took a conspicuous part in the social and economic, as well as the religious, questions agitating an industrial community, while in the House of Lords his eloquence and clear common-sense gave him an influence not confined to ecclesiastical matters. These same qualities proved of value in a mission which he undertook to the United States in 1918 in connexion with the war.

**LANGLE DE CARY, FERNAND LOUIS ARMAND MARIE DE** (1849– ), French general, was born at Lorient July 4 1849, entered the St. Cyr military school in 1867 and left at the head of his class in 1869, being commissioned to the Chasseurs d'Afrique. In the war of 1870, having been selected for staff employment, he was orderly officer to Gen. Trochu, commander-in-chief of the Paris forces, and at the last sortie from Paris (Buzenval, Jan. 19 1871) he was severely wounded, and decorated for bravery. In the years of peace his promotion was at first somewhat rapid, but later, owing to his political and religious opinions, it was slow; and though he had become *chef de bataillon* as early as 1885 it was not till 1900 that he was made a general of brigade, and not till 12 years later that he obtained the membership of the Superior War Council which carried with it the command of an army in war. When the World War broke out in 1914 he was appointed to the IV. Army, which underwent the vicissitudes and final disaster of the battle in the Ardennes; but, unlike Ruffey and Lanrezac, he was not relieved of his command. He continued at the head of this army—though its strength was greatly reduced for the benefit of Foch's new IX. Army—in the Marne and Aisne operations and in the trench-warfare fighting of 1915, and in Dec. 1915 was made commander-in-chief of the centre group of armies. In this capacity he became responsible, amongst other duties, for overseeing the defensive readiness of Verdun. Already grave uneasiness existed in the army and in Parliament as to the capacity of Verdun to resist attack. The assurances given by the military authorities only half satisfied public opinion, and when the storm broke over Verdun in Feb. 1916 and the fears that had been expressed proved to be only too well founded, the command was radically reorganized, and Langle, who had already reached the age-limit for retirement, was replaced at the head of the centre group of armies by Pétain.

**LANGLOIS, HIPPOLYTE** (1839–1912), French general (*see* 16.177), died in Paris Dec. 12 1912.

**LANKESTER, SIR EDWIN RAY** (1847– ), English biologist, was born in London May 15 1847, eldest son of Edwin Lankester (1814–74), a well-known physician and naturalist and F.R.S. He was educated at St. Paul's school, Downing College, Cambridge, and Christ Church, Oxford. In 1870 he was made Radcliffe travelling fellow, and in 1872 was elected to a fellowship at Exeter College, Oxford. During 1874–90 he was professor of zoology and comparative anatomy at University College, London; from 1891 to 1898 he was Linacre professor of comparative anatomy at Oxford; and from 1898 to 1907 he was director of the natural history departments of the British Museum. He was created K.C.B. in 1907. He received hon. degrees from most of the universities of Europe and became a member of many learned societies in England and America. His numerous publications include *Comparative Longevity* (1871); *Degeneration* (1880); and the more popular *Science from an Easy Chair* (1910); *Diversions of a Naturalist* (1915); *Science and Education* (1919) and *Secrets of Earth and Sea* (1920).

**LANREZAC, CHARLES LOUIS** (1852– ), French soldier, was born at Pointe-à-Pitre, Guadeloupe, July 31 1852. Entering the military academy of St. Cyr in 1869, he fought in the latter part of the war of 1870–1 as a sub-lieutenant of infantry. Graduating from the École de Guerre (staff college) in 1879, he held in succession various staff and instructional positions, in particular at the École de Guerre during the period in which, under the influence of Maillard, Langlois and Bonnal, the new French doctrine of strategy and tactics was being established. To the furthering of this doctrine Lanrezac himself contributed a study of Napoleon's spring campaign of 1813 (*La Manœuvre de Lützen*), but it was chiefly through his personal methods of instruction that his influence made itself felt. He became colonel in 1902, general of brigade in 1906, general of division in 1911, corps commander in 1912, and finally in April 1914 he succeeded Galliéni as a member of the *Conseil Supérieur de la Guerre* and commander-designate of the V. Army in case of war.

In this capacity, Lanrezac, as Galliéni had done before him, soon came to the conclusion that the V. Army, on the left of the French line, would be exposed to the weight of a decisive German attack coming through southern Belgium. But General Joffre and those members of the general staff who, under him, had prepared "Plan No. 17" for the war concentration of the French army, thought otherwise, and when war came at the end of July in the same year, the railway concentration of the army was carried out as planned, without the modifications in the defensive sense that Lanrezac's views, if accepted, would have required. Moreover, the later French doctrine of strategy and tactics, which had sprung up since 1910 and was championed by the younger school of staff officers, rejected the new Napoleonic theories of Lanrezac's generation, tended to the almost complete exclusion of the defensive as a mode of war, and its advocates were fully prepared to commit the fate of France to the chances of an immediate general offensive in Lorraine and Ardennes. This being presumed to succeed, events beyond the extreme left of Lanrezac's army might be ignored, and his fears might be (and undoubtedly were) put down to his predilection for that defensive-offensive which he had constantly taught. The Grand Quartier Général thus began the campaign with a prejudice against Lanrezac's theories of war.

It was not until Aug. 15 that the reality of the danger to the V. Army began to be accepted by Joffre, and measures were taken to bring that army towards Namur and Charleroi; and even then the fact that the greater part of the German striking wing would be W. of the Meuse was not definitely admitted either by Joffre or, for that matter, by Lanrezac himself. Thus the battles of Charleroi and Mons were begun under the most unpromising conditions as regards unity of purpose. Moreover, Lanrezac's own subordinates allowed themselves to be carried away by the doctrine of the offensive, and engaged in a confused battle with Bülow's II. Army in the tangle of suburbs and mining villages round Charleroi, in spite of Lanrezac's formal order to stand on the defensive on the open heights S. of the Sambre. And, lastly, tactical liaison with the British on the left and personal liaison with its commander, Sir J. French, were both imperfect. In such circumstances misunderstandings could hardly be cleared up or good relations established either with the distant Grand Quartier Général or with French during the unexpected and trying retreat of the Allied left wing which followed. But Lanrezac, aided by his chief of staff General Hely d'Oissel, managed to bring off his army, and so far to restore its normal organization and *moral* that it was able to take the offensive in the battle of Guise, St. Quentin without support either from the IV. Army on its right or from

[1] As regards the British, Sir Douglas Haig, commanding the I. Corps, promised co-operation, but was obliged by orders from Sir John French to withdraw the promise before the battle.

the British on its left. The success of the V. Army at Guise could not, in the general situation of the moment, be followed up or extended, and the retreat was resumed. Henceforward the army headquarters had the troops well in hand, and such attempts as were made by the Germans to envelop the now exposed left wing came to nothing. Already, however, Joffre had determined to dismiss summarily a large number of the generals who had played a part in the battle of the Frontiers, as a measure tending to restore the *moral* of the army and the nation. One of these, and the most conspicuous, was Lanrezac. On the day of the battle of Guise, Joffre had visited his headquarters with the intention of relieving him of his command, but had thought better of it. Nevertheless, a few days later, on the eve of the battle of the Marne, Lanrezac was removed from his command, being succeeded by one of his corps commanders, General Franchet d'Espérey.

The justice of his dismissal was far too questionable for him to be relegated to unemployment. He served as an inspector-general of infantry-training till the end of the war, and retired on reaching the age limit.

After the war General Lanrezac published a short account of the Charleroi campaign and the retreat of the V. Army, which besides his personal justification contains important documentary material for the general history of the 1914 campaign. (*Le Plan de Campagne Français*, Paris 1920.)

**LANSBURY, GEORGE** (1859– ), English Socialist, was born Feb. 21 1859, at Halesworth, Suffolk, where his father was engaged as a sub-contractor on the railway line between Ipswich and Yarmouth. When he was seven years old the family moved to London, and his childhood was chiefly spent in Whitechapel. In 1880 he was married to Elizabeth Brine, daughter of Isaac Brine, timber merchant. In 1884 they went with their three older children to Australia, returning in 1885, and soon afterwards settling in Bow, where their home has been ever since. Lansbury worked in the business of his father-in-law and was one of the first members of the Gas Workers' and General Labourers' Union—now the National Union of General Workers. In 1921 he had been a member of this union for 30 years, and for the greater part of this time one of its trustees. He began his political life at the age of 15 as a keen Radical, but subsequently became a convinced Socialist, a member of the I.L.P. and a member of the National Executive of the Labour party. He was a member of the Church Socialist League from its inception. He was first elected a guardian in Bow in 1892, was elected to the Borough Council in 1901 and was mayor of Poplar in 1919–20. As a member of the Royal Commission on the Poor Law he signed the Minority Report. He sat for three years on the L.C.C. In 1910 he was elected Labour M.P. for Bow and Bromley. He resigned his seat in 1912, in order to recontest it as a supporter of women's suffrage, and was defeated. He was defeated again in the general election in 1918. In 1913 he was sentenced to six months' imprisonment for a speech made at the Albert Hall, but was released after some days of hunger strike. He had helped to found the first *Daily Herald* in 1912 as a Labour organ, and he became its editor in 1913. The *Herald* became a weekly in September 1914, and reappeared as a daily in March 1919, its policy being extremist and even Bolshevist. In this connexion Mr. Lansbury visited Russia in 1920 and was accorded an interview with Lenin.

**LANSDOWNE, HENRY CHARLES KEITH PETTY FITZMAURICE,** 5TH MARQUESS OF (1845– ), British statesman (see 16.284), had, during his tenure of office as Foreign Minister (1900–5), definitely set his mark on British foreign policy at a crucial period in history. The system which his predecessor, Lord Salisbury, had inherited from Lord Beaconsfield, of a general reliance on Germany and the Triple Alliance, had become no longer possible, in view of the unconcealed ill-will of Germany during the Boer War, and the German resolve to build a fleet sufficiently large to constitute a serious challenge to the British navy. During the South African War of 1899–1902 Great Britain felt all the disadvantages of isolation. If she could no longer rely on Germany, she had recently nearly come to blows with France over Fashoda, and her historical friction with Russia continued. Her isolation was equally marked in the Far East. Germany, Russia and France had forced Japan, after her Chinese war, to relinquish her conquest of the Liao-tung peninsula. England had refused to join the other European Powers in their action, but had simply stood on one side and allowed them to work their will. Subsequently Russia had overrun Manchuria and seized Port Arthur; France had effected a favourable revision of her frontier in the Mekong valley, and Germany had seized Kiaochow. It is Lord Lansdowne's great title to fame that his five years' tenure of the Foreign Office rescued Great Britain from this position of peril, procured her an ally in the rising maritime Power of the Pacific, Japan, and in Europe established her on terms of friendship and mutual understanding with France, by clearing away all the sources of bickering between Paris and London. He shares this credit, indeed, with Mr. Balfour, who was Prime Minister 1902–5, and of whom he himself testified, in Nov. 1905, that there had never been a Prime Minister who had given closer and more unremitting attention to foreign affairs.

When the Duke of Devonshire resigned from Mr. Balfour's Government in 1903 Lord Lansdowne became the Unionist leader in the House of Lords, and though the fall of Mr. Balfour's Ministry in Nov. 1905 transferred him to the Opposition bench he remained the leader of the majority of that House until his resignation in Dec. 1916 at the close of Mr. Asquith's Coalition Ministry. His polished and courteous manner, his thorough acquaintance both with his work and with the idiosyncrasies of the peers, his cool temper and the sweet reasonableness of his expositions of policy speedily rendered his leadership most acceptable to his followers, in spite of the drawback, from the point of view of the Tory majority among them, that he was himself an old Whig. He rendered consistently patriotic support to the development by Sir Edward Grey of the foreign policy for which he himself had been responsible. In domestic politics he endeavoured, as far as possible, to limit points of difference with the Commons; but the measures of the Liberal Ministry inevitably brought about a conflict, which came to a head over Mr. Lloyd George's budget of 1909. In advising the Lords to reject it—as they did—he claimed that it was not an ordinary budget, but emphatically one that ought to be referred to the electorate to decide. Next year, however, he accepted the result of the general election of Jan. 1910 as making it obligatory upon the peers to pass the Finance bill. On the constitutional question he formed one of the abortive conference which met after King George's accession to endeavour to come to an agreed solution. He supported Lord Rosebery's Resolutions for the reform of the House of Lords, and, after the second general election of 1910 on the point of the Lords' veto, he brought forward in 1911, as an alternative to the Parliament bill, a scheme for reconstructing the Upper House, which, however, was dropped after a second reading. When the Parliament bill itself came up to the House of Lords he moved and carried, by 253 to 40, an amendment providing for a submission to a popular vote of bills affecting the Constitution or otherwise of great gravity. From that amendment he and his friends would not, he said, recede so long as they were "free agents." Ministers immediately announced that they would not accept the amendment, and that the King had consented to create, if necessary, sufficient peers to ensure the passage of the bill in its original form. Lord Lansdowne held that, after this threat of coercion, the peers had ceased to be free agents, and he therefore advised them to desist from further resistance. In this advice he was supported by Mr. Balfour, but a vehement opposition developed in the Unionist party, headed by the ex-Lord Chancellor, Lord Halsbury, and these "Diehards" were supported by such a large body of opinion that the bill was only carried eventually by 17 votes.

This episode gave a shock to Lord Lansdowne's authority both in his House and in the Unionist party, but he remained leader, though Mr. Balfour retired shortly afterwards and was succeeded in the leadership of the party in the Commons by

Mr. Bonar Law. He fought the Irish Home Rule bill and the Welsh Disestablishment bill strenuously on their successive appearances in the House of Lords, and procured their rejection by large majorities. But he was always ready for an agreement by consent over the Irish question, to avoid the "irremediable misfortune," the "overwhelming catastrophe," of civil war. He endeavoured to make the Government's Amending bill in 1914 more satisfactory by getting an amendment inserted to exclude the whole of Ulster from the operation of the Home Rule bill. When ministers would not accept this he became a member of the Buckingham Palace Conference as a last chance of a peaceful settlement.

The World War reduced all these issues to comparative insignificance, and Lord Lansdowne associated himself with Mr. Bonar Law in tendering at once their hearty support to the Government, as leaders of the Opposition, in rallying to the assistance of France and Russia. In 1915 he joined Mr. Asquith's Coalition Ministry without portfolio; and took the lead in pressing the military service bills on the House of Lords. He concurred in sanctioning Mr. Lloyd George's efforts, in the early summer of 1916, to find some satisfactory settlement of the Irish question, but he dissociated the Government from Mr. Lloyd George's actual proposals; and the failure to reach an agreement was largely attributed by Irish Nationalists to his insistence on the necessity of repressing treason and sedition. He retired from office at the close of Mr. Asquith's Ministry, the Unionist leadership in the Lords being then entrusted to Lord Curzon. In his retirement he got somewhat out of touch with public opinion, and published in the *Daily Telegraph*, in Nov. 1917, a letter in which, to the general surprise, he strongly advocated a negotiated peace instead of the policy of Thorough, on which the Ministry and the Empire were set. His ideas received hardly any support save from the small pacifist section. In subsequent years he took little or no active part in politics, his health having failed.

Lord Lansdowne's great and various services to his country were rewarded with the K.G., G.C.S.I., G.C.M.G., and G.C.I.E. He was a trustee of the National Gallery, and chairman of the Council of the British Royal Red Cross Society 1915–20. His own university of Oxford gave him an honorary degree; and so did Cambridge, McGill and Leeds. He had two sons and two daughters. His elder son, Lt.-Col. the Earl of Kerry (b. 1872), a soldier who won both the D.S.O. and the Legion of Honour, was in the Irish Guards, and served in the S. African War. He was a member of the L.C.C. in 1907, and was M.P. for W. Derbyshire 1908–18. He married in 1904 Elizabeth Caroline, only daughter of Sir E. S. Hope, and had a family. The younger son, Lord Charles G. F. Mercer Nairne (1874–1914), major 1st Dragoons, served both in the S. African War and in the World War, and was killed in action in France, Oct. 30 1914, leaving a widow and children. The elder daughter married the 9th Duke of Devonshire, and the younger married the 6th Marquess of Waterford, and, after his death, Lord Osborne de Vere Beauclerk. (G. E. B.)

**LANSING, ROBERT** (1864– ), American diplomatist, was born at Watertown, N.Y., Oct. 17 1864. He graduated from Amherst in 1886, was admitted to the bar in 1889, and for the next 18 years was associated with his father in legal practice at Watertown. In 1892 he was appointed associate counsel for the United States on the Bering Sea Commission, and later was American counsel or agent before several important arbitral tribunals or mixed commissions, including the Alaskan Boundary Tribunal (1903), the Hague Tribunal for Arbitration of the North Atlantic Fisheries (1910), and the Anglo-American Commission (1912) for settling outstanding claims between Great Britain and the United States. He was technical delegate at several international conferences, including the fur-seal conference (1911) at Washington between the United States, Great Britain, Russia and Japan. In 1914 he was appointed counsellor of the Department of State. When Mr. W. J. Bryan resigned (June 8 1915) because of unwillingness to sign the second "Lusitania" note, Mr. Lansing was appointed Secretary of State *ad interim*, and his first official action was to sign that note. He was definitely appointed Secretary of State on June 23 1915. In Aug. he was attacked by the Friends of Peace, representing several societies, mostly German-American, who declared that he was liable to plunge America into war. In his attempts to uphold American rights he was called upon to direct notes to all the warring countries. On Oct. 18 1915, defining safety for crews in a note to Germany after the sinking of the "William P. Frye," he pointed out that it was not sufficient that Americans be given an opportunity to embark in life-boats; it must be under circumstances that assured landing in safety. A little later he sent a protest to England against the commercial blockade and the detention of cargoes bound for neutral ports. On Jan. 18 1916 he addressed a note to all the European belligerents, asking, for the sake of safety of those on board, that all guns be removed from merchantmen. He pointed out the disadvantage of a submarine in attempting to stop such an armed vessel for search, and emphasized that armament on a merchantman had every appearance of being offensive. In March this proposal was rejected by all the Allies. On Aug. 4 1916 he signed a treaty for the purchase by America of the Danish West Indies for $25,000,000. In reply to a note addressed by England to neutrals, asking that all belligerent submarines be excluded from neutral waters, he said that the nature of each submarine must govern the decision. He thus drew an important distinction between the "Deutschland," which had peacefully brought a cargo to America, and the U53, which had raided several ships off the New England coast Oct. 7 1916. In March 1917 he refused Government support to the proposed reorganization of the so-called "Six Power" loan for China. He declared that American bankers should not enter into agreement with foreign institutions which had more or less a Government connexion and might therefore have political as well as financial interest in the matter. The same year he notified President Carranza, of Mexico, that the United States would not adopt his proposed Pan-American plan of stopping the shipment of food and munitions to all the European belligerents. In Nov. 1917 he signed an agreement with Japan (the Lansing-Ishii agreement) which, while recognizing Japan's special interests in China, provided for a continuance of the "open door" policy for commerce.

He was a member of the American Commission to Negotiate Peace at Paris 1918–9, and, together with Lord Robert Cecil and Col. House, prepared a draft of the League of Nations in Jan. 1919. In a book issued in 1921 in justification of his own actions, Mr. Lansing explained that he disagreed with Mr. Wilson on various points, including that of incorporation of the League of Nations in the Peace Treaty; but he was overtly responsible with him for signing the Treaty, and on his return to Washington he urged that the Treaty as formulated be adopted by the Senate. On Feb. 13 1920 he resigned as Secretary of State on being reprimanded by the President for having called together the heads of the executive departments of the Government. Such meetings of the Cabinet had, however, frequently been called before during the President's illness, naturally by the Secretary of State as ranking member. Lansing's conduct at this juncture showed dignity and self-possession, and the action of the President was generally regarded as that of a sick and worried man. In Aug. 1920 he opened a law office in Washington. He was the author of *The Peace Negotiations* (1921) and *The Big Four and Others* (1921).

**LAPWORTH, CHARLES** (1842–1920), English geologist (*see* 16.208), died at Birmingham March 13 1920.

**LASCELLES, SIR FRANK CAVENDISH** (1841–1920), English diplomatist, was born in London March 23 1841, the third son of the Rt. Hon. William Saunders Sebright Lascelles by his wife Lady Caroline Georgiana Howard, daughter of the 6th Earl of Carlisle. He entered the diplomatic service in 1861. In 1867 he was secretary of legation at Berlin, and in 1871 was transferred to Paris as second secretary. After various more or less brief appointments, he went in 1879 as agent and consul-general to Bulgaria. He was created K.C.M.G. in 1886, and in 1887 was

appointed minister to Rumania. In 1891 he went to Persia, but in 1894 was recalled from Teheran and sent as ambassador to Russia, where, however, he only remained a year, being transferred in 1895 to the court of Berlin. His period as ambassador to Germany opened in a singularly inauspicious manner, as in 1896 occurred the incident of the Kruger telegram, which naturally aroused great anger in England and rendered his position extremely difficult. After the storm had blown over, however, the relations of the British ambassador with the Emperor became of the most friendly and intimate character. He retired in 1908 and died in London Jan. 2 1920. He was made a privy councillor in 1894, G.C.M.G. in 1892, G.C.B. in 1897, and G.C.V.O. in 1904. He married in 1867 Mary Emma, the eldest daughter of Sir Joseph Olliffe, physician to the British embassy in Paris. He left, besides two sons, a daughter, who married in 1904 Sir Cecil Spring-Rice.

**LATVIA.**—The independent republic of Latvia (capital Riga) was proclaimed on Nov. 18 1918, and was recognized by the Supreme Council of the Allied Powers on Jan. 21 1921. Its territory comprises chiefly districts of the Baltic provinces of the Russian Empire, which linguistically or ethnographically belonged to the Letts, whence the name of Latvia as a new nation-state. Its area is approximately 25,096 sq. m., formed by: (*a*) four districts of Livonia (Riga, Wenden or Zehsis, Wolmar or Walmer, and Walk, with the exclusion of the chief town ceded to Esthonia), 7,900 sq. m.; (*b*) Courland, about 10,500 sq. m., both parts being united legally by the Russian law of April 12 1917 but actually since Jan. 1919; (*c*) districts of the province of Vitebsk, called Latgalia, 5,290 sq. m., with the towns of Riezhitsy (Rositten, Resekna), and Lutzin (Ludze), obtained by force of arms from Soviet Russia (Art. 2 of the Russo-Latvian Treaty, Aug. 11 1920), with the town of Dvinsk (Dünaburg, Daugapils) obtained by agreement from the Poles. Rectifications of the frontiers with Lithuania, with regard to the coast of Polangen and the zone near Illuxt, were still in process in 1921.

*Population.*—According to the census of June 15 1920 the population of Latvia was less numerous and homogeneous than was anticipated in 1918, amounting in all to 1,515,815 inhabitants, of whom 1,146,554 were Letts and 355,518 belonged to other nationalities (Livonia, 477,839 Letts and 104,091 non-Letts; Courland, 404,159 Letts and 71,524 non-Letts; Latgalia, 264,556 Letts and 179,103 non-Letts), the non-Letts thus forming about 25% of the total population. These so-called "minority" nationalities were: Russians, Germano-Balts (Balts, Balto-Saxons), Jews, Lithuanians, Poles. In consequence of the political events the number of resident Russians and Balts was in 1921 decreasing, though the number of Russian refugees was considerable. The losses of the Letts were due to: (*a*) the evacuation of the factories by the Russian Government; (*b*) the partly forced removal of the population of Courland before the German advance; (*c*) the wars. In 1916–7 there were 735,000 Lettish refugees in Russia, and 250,000 men aged 20–40 are supposed to have perished between 1914–20. During 1920 and the first two months of 1921 134,000 returned to Latvia, of which 94,000 entered Latvia from Russia, while only 6,400 left for Russia.

*Education*, in those parts of Latvia where it was standardized by the Protestant Church and Baltic régime, remained on a higher level than in Latgalia with only 38% able to read. The census of June 1920 gave instructive figures: 69·82% able to read, children below 10 years included; 50% able to read and write. The percentage of literacy according to nationalities was: Germano-Balts 85, Esthonians 82, Poles 78, Letts 74, Jews 72, unknown 60, Lithuanians 55, Great Russians 36, others 33, White Russians 32. In Sept. 1919 the Polytechnic Institute of Riga was converted into the Latvia University. Lectures are delivered in Lettish, Russian and German, and nearly all the staff is Latvian. Students on March 1 1921 numbered 2,111 men and 1,145 women, 2,328 students being Letts, 803 minority nationalities, 125 foreigners. In 1912 in the corresponding area there were 98 secondary schools with 22,600 pupils, one per 26,000 inhabitants (in Germany one per 54,000). Compulsory and gratuitous schooling for the Protestants had been enforced in Livonia since 1860, and in Courland since 1875.

*Religion.*—Seventy-five per cent at least of the Letts are Protestants, but there is a Catholic majority in Latgalia and a number of Greek Orthodox among the Letts. The organization of the Protestant Church was formerly connected with the corporation of the nobles of Livonia and Courland, but the rights of presentation pertaining to the manorial estates of the knights and to the Government estates have been abolished by the introduction of a democratic free church.

*Occupations.*—The pre-war growth of industries, especially in Riga and Libau, tended to reduce the percentage of the agricultural population, but agriculture is still the chief occupation, and the redivision of the rural population was the outstanding feature after 1918. (*a*) The large landowners, owning about 1,899 estates (of these 310 were in Latgalia), mostly Balts and gentry ("Baltic barons"), were expropriated (Land Act, Sept. 16 1920); (*b*) about 40,000 owners of small holdings, averaging from 26 to 150 ac., formed the backbone of the Lettish middle class, and the liberal professions (nicknamed the "grey barons") were partly supported by about 10,000 tenants of small farms; (*c*) the owners of very small holdings in Latgalia and Courland numbered some 10,600. Of the agricultural proletariat two-thirds were employed by small owners and one-third by the owners of large estates. This class, who desired to own their own land, were believed to have been won over and pacified by the expropriation of the owners of the large estates. In the territory of Latvia the creation of peasant proprietorship was secured before the war in different ways: (*a*) on the manorial estates; (*b*) on the Government estates; and (*c*) in Latgalia, on the Russian system.

*Effects of the World War.*—The losses suffered by Latvia from evacuation, war, occupation, invasion and Bolshevik rule almost ruined her beyond hope; the official statistician Skuieneeks estimated in 1920 that it would take 50 years to bring her back to the pre-war level. In 1920 there were only 17,606 workers and employees in private industrial enterprises, 988 in municipal enterprises, and 2,880 in state enterprises; in Riga alone, 9,739 in private enterprises against 62,000 in 1914. In Jan. 1913 Riga numbered 517,522 inhabitants, in Aug. 1917 210,590. According to the census of 1920, of 609,475 buildings in the rural districts 84,163 had been completely destroyed and 117,015 partly. In 1920 there were 238,736 horses, 730,421 cattle, 934,084 sheep and 457,052 pigs, against 297,645 horses, 940,319 cattle, 1,100,481 sheep and 538,920 pigs in 1913. Of the total area of arable land, *i.e.* 4,091,490 ac., only 2,978,570 were under cultivation in 1920, with 473,410 ac. under winter rye against 862,400 in 1913. The total losses suffered by private citizens and corporate societies until the advent of Bolshevism is valued at 1,930,000,000 gold rubles; Soviet Russia inflicted losses to the amount of 953,000,000 gold rubles; German occupation and warfare to that of 481,000,000 marks. Through confiscation of money, and deposits in banks removed to Russia, cancellation of shares, destruction of private and public bonds, and loss of interest, a loss of 379,000,000 gold rubles was caused by Russia, and 6,000,000 marks by Germany. Courland during the advance of the German army lost two-thirds of the population, which began to return after the Brest Litovsk Peace in 1918. In 1916–7 there were 735,000 Lettish refugees in Russia. Lettish man-power suffered more particularly. Soviet Russia found many soldiers among the Lettish refugees, and retained the Lettish rifle division which had fought during the war. In Aug. 1913–4 there were 550 engines and 18,000 carriages and trucks, 3,000 telegraph and 800 telephone apparatus; on Aug. 5 1919 only 25 engines, 64 carriages and 2,023 trucks, 49 telegraph and 28 telephone apparatus were left. Only 11 engines were working. Trade was therefore still a mere fraction of what it was before the war. Both industry and commerce were largely dependent on foreign (German, Baltic and Russian) capital, and agriculture on large and small agricultural enterprise constantly and rapidly growing. The German industrial capital in Riga amounted to 40,000,000 rubles before the war. The arable land in Livonia covered 15·28% in 1866, 16·52% in 1881, 26·65% in 1911. What the war and revolution had left of the large farms, subsequent agrarian legislation further damaged; and in 1921 the Latvian state was still struggling against the dislocating effects of war and revolution, and its finance and commerce were seeking new methods of reconstruction. The rate of exchange had become adverse (by May 1921 £1 = 1,850–1,900 Latvian rubles), and imported goods were getting more and more expensive to the consumer. The returns for 1920 show that 805 ships left Libau, 751 Riga and 123 Windau. British tonnage held the first place, German the second and Danish the third.

*Resources.*—The natural resources of Latvia are mainly timber and agricultural produce. Brown coal has been discovered in Courland, while peat is already a valuable fuel.

*History of Latvian Independence.*—With the outbreak of the World War in 1914 a prospect of some kind of national existence opened out to the Lettish *intelligentsia*, whose antipathy to Germany did not imply a readiness to die for Russia. They rose in order to fight for their own rights, liberties and land. The immediate object was to overthrow Russian administrative supremacy and to emancipate themselves from the Baltic barons. Great political skill was displayed in finding subsequently support against both. Libau was taken on May 7 1915 by the Germans; the rest of Courland, with one-third of its former population left, was occupied, and German preponderance materialized. The Russian Government permitted the formation on July 13 1915 of a Lettish rifle division, 30,000 men strong. During the winter of 1916–7 these volunteers experienced heavy losses; after the Russian revolution in March 1917,

Bolshevik sympathies spread among these troops and large sections of the people, while on the other hand national aspirations united the Farmers' Political League (40,000 members), headed by K. Ulmanis, with numerous Letts abroad and in Russia. Even after the fall of Riga (Aug. 20 and the supplementary treaty Aug. 27 1917) this action was continued as opposed to the policy of the leading Balts (Sievers, Oettingen, Baron Pilar, Stryck), who were alarmed by the Bolshevik upheaval, the congress of the landless workers at Wolmar (Dec. 16–19 1917), the outrages of the Russian soldiery, the impotence of the more moderate Letts, the universal anti-German feeling, the danger to life and property, and obtained the occupation of the whole region up to Narva by German troops, thus aiding and abetting the Germans in their plans of domination. The Bolsheviks, on their retiring from Wenden and Walk (Feb. 1918), carried away hundreds of hostages, chiefly Balts, to Siberia, some of whom were shot, whilst others were repatriated later. The German occupation did not prevent the Lettish National Council, on June 26–29 1918, from claiming the reunion of all Lettish territories in accordance with the protest addressed to the German Chancellor on April 4. On Nov. 11 Z. A. Meierovich received from the British Cabinet a favourable reply to his appeal of Oct. 30 on behalf of Lettish independence. Immediately after the collapse of Germany, on Nov. 23, independence was declared, and K. Ulmanis was elected president.

*Wars for the Liberation of Latvia.*—The German retreat could not be prevented by the provisions of the Armistice (Nov. 11, Art. XIII.); and Ulmanis, under the pressure of a Bolshevik invasion and Bolshevik influence among the Letts, did not succeed in forming an anti-Bolshevik Lettish defence force, but on Dec. 7 consented to the creation of a Baltic *Landeswehr*. Lettish units were shelled on Dec. 30 from a British mine-layer in the harbour of the new capital—Riga. The Baltic volunteers were defeated by the Bolsheviks on Dec. 29 at Hintzenberg; and since the agreement made on Dec. 29 by Ulmanis with the German representative, the Socialist Winnig, did not attract a sufficient number of volunteers from Germany for the formation of an Iron Div., Riga fell on Jan. 3, the British squadron leaving with 500 refugees on board, including members of the new Latvian Government. A Bolshevik Government headed by Shtuchka was installed in Riga. The Baltic *Landeswehr* retired behind the Windau river, and, reënforced by German volunteers, a Russian (Private A. Lieven) and a Lett (Col. Ballod) unit took in Feb. Goldingen and Windau, in March Kandau, Zabeln, Kabillen and Tukkum. By March 18 the Bolsheviks were thrown back over the Aa river. Libau formed the base; Germany furnished the supplies; the Balts (Baron Pilar, Baron Rahden) undertook the leadership. The liberation was thus made dependent on the goodwill of Germany. Ulmanis, confined on the steamer "Saratov" at Libau, had no fighting force at his disposal, and his attempts to call the population to arms were opposed as pro-Bolshevik manœuvres. The murder of three men of the Baltic *Landeswehr* led to the *coup* of April 16 1919, by the proclamation of the Government of a Lettish clergyman, Needra. Parleys, in which the United States and England took part, did not prevent the advance on Riga and the liberation of this city on May 22, where Baron H. Manteuffel made an entry with a small detachment, and died leading his men. The Bolsheviks, having killed a number of imprisoned "bourgeois," abandoned the city and the whole region after heavy losses. It now appeared necessary to the Entente Powers to avert Baltic and German preponderance in Latvia as a consequence of the military situation, and the policy of non-intervention was abandoned in favour of Ulmanis' Government. The Baltic *Landeswehr*, unsupported by the other units, were engaged with Esthonian and Lettish forces near Wenden, and were defeated. The Esthonians were hailed as liberators of Riga by the Lettish Assembly. The German volunteers, forming about 15%, had to evacuate according to the armistice of July 3, [illegible] the advantages of the Dec. agreement. The *Landeswehr* under an English officer, Col. A. R. Alexander, became a [illegible] Lettish army (final agreement on July 15 1919) to be formed by Gen. Ballod, and had now to own allegiance to the Ulmanis Government, while the Russian volunteers were transferred to the Narva front. But the Ulmanis Cabinet was not as yet the sole ruler of Latvia, the Bolsheviks holding Latgalia, and a Russo-German force under Bermondt-Avalov preparing an advance against the Bolsheviks across Latvian territory, a plan adopted at a Riga conference on Aug. 26 presided over by Gen. March, but later abandoned. Bermondt's army in Aug. numbered 10,000 men. The Lettish Government decided to stop the advance on Dvinsk and Rezhitsa at any cost, as a danger to Latvia's independence, and succeeded in obtaining British and Esthonian support. Bermondt, having refused to join Gen. Yudenich's army on the Narva front, decided to advance and to occupy the Duna line, after small skirmishes with the Letts. On Oct. 9 the fighting began; Riga was shelled for five weeks. By Dec. 1919 what had been regarded as a Russo-German danger was averted, the Russian volunteers on the left flank having suffered heavily from the English gunfire. The German mercenaries evacuated Courland by Jan. 1920 and vented their disappointment at the non-fulfilment of the promises made them by devastations. On the eastern front the Bolshevik danger was also overcome. Dvinsk was taken by the Poles, and Rezhitsa (the main town of Latgalia) by the *Landeswehr*, who advanced to Rözhanova. One-quarter of the opposing Bolshevik army were Letts; Gen. Ballod's Lettish troops played a minor part on this front.

*The New Government.*—The result of the operations consolidated the Latvian Government. On Feb. 18 the Bolsheviks made peace overtures, and Latvia was prepared to negotiate The *Landeswehr*, having been the chief instrument of freeing Latvia from the Reds, was reorganized (March 10 1920), and Col. Alexander departed. The elections for the Constituent Assembly took place on April 18, and negotiations with Germany for reparation were opened. On Aug. 11 1920 the Russo-Latvian peace treaty was signed, following the agreement of June 20 1920 regarding the reëvacuation of war refugees, of whom about 100,000 were supposed to be in Russia. Riga and the other towns were provided with foodstuffs by the United States.

The Russo-Latvian treaty granted to Latvia: (*a*) an ethnographic frontier; (*b*) the restoration of confiscated property; (*c*) an advance payment of 4,000,000 gold rubles (=£1,200,000) on account of the returnable securities; (*d*) a timber concession of 260,000 ac., in order to assist the peasantry to reconstruct their buildings; (*e*) amnesty for Latvian citizens; and (*f*) non-liability for Russian state debts. Soviet Russia, represented by A. Joffe and J. Ganetsky, obtained: (*a*) the disarmament of anti-Bolshevik forces in the territory of Latvia; and (*b*) favourable transit conditions. The amnesty was not to be extended to the participators in the *coup* of April 16 1919 and the Bermondt campaign. The security offered by this treaty was further guaranteed by the formation of a regional league of the Baltic states against external aggression.

The Constituent Assembly convened in 1920 was still at work in 1921. The question of the rights of the national minorities and the enforcement of the Land Act were among the problems of the day that led on June 3 1921 to the fall of the Cabinet of Ulmanis. The recognition of Latvia by the Supreme Council at Paris on Jan. 21 1921 was one of the numerous achievements of Latvian diplomacy; but an attempt against the life of the ex-Premier Ulmanis and the opposition of the Social Democrats and Communists showed that the pacification necessary for a work of reconstruction had not yet been accomplished.

By the Land Act of Sept. 1920 (passed in order to curtail the power of Baltic landowners) a State fund was created with a view to forming new holdings and increasing the size of the minute holdings, and "in order to satisfy the requirements of economic enterprises, social and cultural institutions and to enlarge the areas of towns and villages." With the State fund are incorporated all large estates, small farms not yet purchased by the occupants and lands acquired by colonization companies, foreign banks and similar bodies. Along with the land are expropriated all claims and rights appended to the land and all instruments of husbandry, live stock included, with the exception of such industrial establishments as are not working to satisfy the local rural demand only. A portion of the estate, equal in size to the average holdings, is left to the owner, without, however, the proviso that this portion must necessarily coincide with the

administrative centre, the manor or family house. Lands with an acreage below 246 ac. are not expropriated. The churches retain land not exceeding the average size of a holding, including the buildings. The owners of the expropriated properties are given a term of five months for the removal of their furniture. Liabilities arising out of agreements concluded after May 6 1915 are null and void if not sanctioned by the Government. All contracts of lease, exploitation of forests, waters and natural riches are cancelled. Firewood and timber felled during the period of the German occupation fall to the State. Compensation for the expropriated land and the categories of land to be expropriated without compensation will be determined by a special law. The local market price will form the basis of the indemnity for the live stock and implements to be expropriated. Though radical enough, this Land Act was still not sufficient to satisfy the groups which came into political power on June 3 1921. Foreign Governments lodged protests against their subjects being dispossessed before obtaining adequate compensation. About 160 estates were not to be subdivided, but preserved as funds for schools, hospitals, local institutions, etc.

See *The Latvian Economist*, published monthly in Riga since May 1920. (A. M.)

**LAUDER, SIR HARRY MACLENNAN** (1870– ), British variety actor, was born at Portobello Aug. 4 1870. He was first a mill-boy in a flax mill at Arbroath, then a coal-miner, and finally took to the variety stage, where he soon became a great favourite on account of his Scotch songs, written and composed by himself on folk-song foundations and sung in character. In this career he earned enormous fees, and made a large fortune. During the World War he worked hard to assist recruiting, and the death in action of his only son in 1918 elicited widespread sympathy. He was knighted in 1919. Early in 1921 he had a season of his own at the Palace theatre, London.

**LAUGHTON, SIR JOHN KNOX** (1830–1915), English naval historian, was born at Liverpool April 23 1830, and was educated at the Royal Institution school, Liverpool, and Caius College, Cambridge. In 1853 he entered the navy as an instructor, and served during the Crimean War, afterwards entering the Mediterranean and Channel fleets successively. In 1866 he became instructor at the Royal Naval College, Portsmouth, and in 1873 was transferred to the Royal Naval College, Greenwich. In 1885 he was appointed professor of modern history at King's College, London, a post which he held until his death. In 1893 he founded the Navy Records Society, of which he became secretary, retiring in 1912. He was knighted in 1907. Sir John Laughton was also a distinguished meteorologist, and from 1882 to 1884 was president of the Royal Meteorological Society. His numerous writings include *Physical Geography in its Relation to the Prevailing Winds and Currents* (1870); *A Treatise on Nautical Surveying* (1872); an edition of Nelson's letters and despatches (1886); *Studies in Naval History* (1887); *Nelson* (in "English Men of Action," 1895); *Nelson and his Companions in Arms* (1896); *A Life of Henry Reeve* (1898); *From Howard to Nelson* (1899), and *Sea Fights and Adventures* (1901). He died in London Sept. 14 1915.

**LAURANCE, SIR JOHN COMPTON** (1832–1912), English judge, was born in Lincs. May 30 1832. Called to the bar in 1859, he became Q.C. in 1877 and recorder of Derby in 1879. In 1880 he was returned to Parliament as Conservative member for S. Lincs., and in 1885 was elected member for the Stamford division. He was made a judge in 1896, retiring in March 1912. He died in London Dec. 5 1912.

**LAURIER, SIR WILFRID** (1841–1919), Canadian statesman (*see* 16:286*). In Jan. 1911 Sir Wilfrid Laurier was still Premier of Canada and had begun the official negotiations for reciprocity with the United States which were to bring about his fall. He was strongly opposed in the Dominion House of Commons. The terms of the agreement, announced in Parliament Jan. 26 1911, were debated throughout the session. Finally, on July 29, Laurier dissolved Parliament and in the ensuing general elections was decisively defeated. He never again held office, though, with the outbreak of the World War in 1914, he came once more into political prominence. No one could more eloquently have urged the justice of Great Britain's cause, or the whole-hearted determination of Canada to take her part in the struggle. But he did not see eye to eye with the Borden Ministry on the question of levies for compulsory foreign service, and in July 1917 he declined Sir Robert Borden's invitation to join a Coalition Cabinet. He died at Ottawa Feb. 17 1919.

**LAVERY, SIR JOHN** (1857– ), British painter (*see* 16:293), was knighted in 1918. Among his works since 1910 are portraits of Mr. Winston Churchill, Mr. H. H. Asquith, Lord Derby, Mr. John Redmond and Sir Edward Carson, besides "The Madonna of the Lakes"; "Canadians Embarking on the Western Front"; "Sir David Beatty Reading the Terms of the Armistice to the German Delegates" and "Fore Cabin, H.M.S. 'Queen Elizabeth,' Rosyth, Nov. 1918." He also painted a number of naval pictures of the fleet at Scapa Flow, which he presented to the Imperial War Museum.

**LAW, ANDREW BONAR** (1858– ), British statesman, was born in New Brunswick, in Canada, on Sept. 16 1858, the son of a Presbyterian minister, the Rev. James Law, by his marriage with Eliza, daughter of William Kidston of Glasgow. Though his early life was passed, and his education begun, in Canada, he, a Scot on both sides, came to Scotland when still a boy, and finished his schooling at the Glasgow high school. He entered at once into commercial life in Glasgow, and became a member of a kinsman's firm, William Kidston & Sons, iron merchants, subsequently joining William Jacks & Co., iron merchants. His success as an iron merchant led to his becoming chairman of the Glasgow Iron Trade Association. But success in business did not satisfy him. He retired with a sufficient competence, and went into Parliament in 1900 as Conservative and Unionist member for the Blackfriars division of Glasgow. His experience in business had led him to the conclusion that Free Trade, in the Cobdenite sense, was no longer beneficial for Great Britain. He made a distinct impression on the House by a speech on April 22 1902, in favour of Hicks-Beach's corn duty, which was imposed in order to find money to carry on the Boer War. In that speech he predicted that, if the cry for protection were again seriously raised in Great Britain, it would not be in the interests of agriculture, but in those of working men, who saw their employment disappearing. The speech so much impressed Mr. Balfour that he introduced Mr. Law into his Government as Parliamentary Secretary of the Board of Trade; and Mr. Joseph Chamberlain's Tariff Reform movement, which was started in the following year, showed how right Mr. Law was in his diagnosis of the future. As the movement proceeded, Mr. Law was regarded as, along with Mr. Austen Chamberlain, the most decided Tariff Reformer left in the Ministry after Mr. Chamberlain's resignation. When he was accused by the Liberals in 1904 of being a Protectionist, he explained on Feb. 9 that he wanted, like Cobden, to improve foreign trade, but adapted his means to present conditions. The Government did not object to imports as such, but wished to see more raw material and fewer manufactured goods. He dwelt on the injury to the working classes caused by "dumping" and unfair foreign competition. He made several speeches in the country in this year and the next, of which the gist was that British trade policy must be relative to circumstances, which had wholly changed from what they were in Cobden's time. He saw the true field for commercial expansion within the Empire, and therefore advocated preferential duties.

There is no doubt that he chafed, in these years, at the slow rate at which his chief, Mr. Balfour, moved in the direction of Tariff Reform; but, though he would have preferred a more whole-hearted acceptance of Mr. Chamberlain's programme, he remained loyal to the Prime Minister. He shared in the general rout of the Unionists in Jan. 1906, but returned to Parliament in May for Dulwich at a by-election. The withdrawal of Mr. Chamberlain from active work in Parliament, owing to ill-health, left the stalwart Tariff Reform Ministry without a leader; his son, Mr. Austen Chamberlain, was his natural representative; but Mr. Law, by a series of fighting speeches both in the House and in the country, made himself particularly congenial to the more prominent members of that section. In 1907, the year of the Imperial Conference, he pleaded strongly for Colonial Preference, a policy against which, in spite of the support which it obtained from Dominion Ministers, Sir Henry Campbell-

** These figures indicate the volume and page number of the previous article.*

Bannerman's Government set its face. He denounced Mr. Lloyd George's famous budget of 1909 as vindictive and socialistic. In the new Parliament returned in Jan. 1910 Mr. Austen Chamberlain and he had the satisfaction of mustering 254 votes (against only 285) in favour of a Tariff Reform amendment to the Address. He left his constituency to fight N.W. Manchester in the election of Dec. 1910, but failed to capture the seat. He returned to Parliament, however, in a by-election for Bootle in March 1911, in time to take his share in the fight over the Parliament bill. But he kept aloof from the "Diehard" movement, and warmly defended his leader, Mr. Balfour, from the reproaches cast upon him. This loyal attitude, no doubt, was one of the reasons, and his strong Tariff Reform programme was another, which recommended him to his party as Mr. Balfour's successor in the leadership when the claims of Mr. Austen Chamberlain and Mr. (afterwards Lord) Long appeared to divide the Unionists pretty evenly. Both the rivals stood aside, and on Nov. 13 1911 Mr. Law was unanimously elected Leader in the Commons, Lord Lansdowne continuing to lead the party in the Lords.

He remained leader for nine years and a few months, the first three years and a half in Opposition and the rest in office. He was very trenchant in his criticism of the Government; thus giving satisfaction to ardent spirits in the Unionist ranks, but causing ministerial speakers to contrast his bitterness and violence with Mr. Balfour's quieter methods. He led a strong fight against the ministerial bills introduced to take advantage of the Parliament Act, and protested vehemently against the relentless closure by which they were driven through the House of Commons. He accused ministers of violating two fundamental conditions of representative government: that the Ministry should not ride roughshod over the minority, and that they should make no vital change till it was clearly desired by the majority of the people. Of the Welsh Disestablishment measure he said that a meaner bill, or one brought forward by meaner methods, had never been placed before the House; in view of the growth of materialism, he protested against depriving a spiritual organization of its funds. But his principal concern was the Home Rule bill and the situation created by it in Ireland. Before it was introduced he went to Belfast in Easter week, and at a great demonstration, presided over by Sir Edward Carson, encouraged the Ulstermen to trust to themselves; Belfast was again, he said, a besieged city; the Government by the Parliament Act had erected a boom against them—they would burst that boom; and it would be said of them that they had saved themselves by their exertions, and would save the Empire by their example. After nearly four months of strenuous opposition to the bill in Parliament, he renewed and strengthened his encouragement to Ulster by declaring, at a large Unionist gathering at Blenheim on July 27, that the Ulster people would submit to no ascendancy, and that he could imagine no lengths of resistance to which they might go in which he would not be ready to support them, and in which they would not be supported by the overwhelming majority of the British people. The Ulster Covenant was adopted in the following Sept.; and, in the course of the prolonged fight in Parliament in the autumn and winter over the bill, Mr. Law took occasion to say that his words at Blenheim were deliberate, written down beforehand, and that he withdrew nothing. Government, he maintained, had no moral right to force through a revolution. When Sir E. Carson moved on New Year's Day 1913 to exempt Ulster from the operation of the bill, Mr. Law defined his position thus. If the bill were—as he claimed it should be—submitted to the electors and approved by them, he and his party would not encourage Ulster to resist. But if it was forced on Ulster he would assist in the resistance. In spite of his efforts the bill was carried through all its stages by an unbroken phalanx of Liberals, Labour men, and Nationalists, showing a majority in important divisions of 110; and was only rejected by the Lords in the early months of 1914.

Meanwhile Mr. Law had to encounter difficulties among his own followers. The two branches of the party, the Conservatives and the Liberal Unionists, had indeed been fused, in May 1912, into one party with a combined national Unionist organization. But the present differences were not on the old lines, but on the extent to which the policy of Tariff Reform should be carried. Mr. Law and Lord Lansdowne announced in Nov. 1912 that they no longer held themselves bound, by the policy advocated by Mr. Balfour before the second election of 1910, to submit the first Tariff Reform budget to a referendum. At once a large section of Unionists, especially in Unionist Lancashire, became alarmed lest their electoral chances should be jeopardized by the prospect of food taxes imposed without reference to the people. Mr. Law endeavoured to reassure these doubters by a speech at Ashton-under-Lyne on Dec. 16. He refused altogether to haul down the flag of Tariff Reform; it was his policy to give British workmen a preference, both in the home and in the colonial market; but he said that a Unionist Government did not intend themselves to impose food duties. What they would do would be to call a colonial conference; and they wished to be authorized to meet colonial views if in the conference the colonies considered a duty on wheat to be necessary. This declaration did not satisfy the free fooders; but there was a general disposition to compromise the question without injuring the unity of the party. Finally, on Jan. 14 1913, in answer to a memorial from the bulk of the Unionist M.P.'s—a memorial which wished for a reassurance as to food duties, but strongly deprecated a change of leadership—Mr. Law announced that he and Lord Lansdowne were willing to agree that food duties should not be imposed without the approval of the electorate at a subsequent general election; and to remain leaders in deference to their followers' appeal, in spite of the party's disregard of their advice. After this declaration the unrest in the party gradually died down.

Mr. Law maintained his stout opposition to the Home Rule and Welsh Church bills on their second and third appearances in the sessions of 1913 and 1914. But in the course of 1913 he found that, partly no doubt owing to his insistence, Ministers began to appreciate the serious difficulty to Home Rule presented by Ulster's determined attitude. Accordingly he stated in the House that Unionists would welcome an Irish settlement by general consent, but would not make new friends by betraying old; and in Oct., in answer to Mr. Asquith's overtures at Ladybank, he said that he and his colleagues would consider any proposals with a real desire to find a solution if possible. If there were not such a solution, he foresaw national disaster and ruin. He attended a great demonstration in Dublin on Nov. 28 and declared then that Ulster would not submit, and the Unionist party would not allow her to be coerced. He did not find in Mr. Asquith's proposals, in the session of 1914, for exclusion by county option for six years, any sufficient compromise; but he formally announced that, if they were endorsed by the country, Lord Lansdowne would use his authority in the Lords to have them passed without delay. The offer was not accepted, and Mr. Law, though he joined the Buckingham Palace Conference in a last hope of aiming at a reasonable settlement, was anticipating the immediate outbreak of civil war in Ireland when the World War supervened.

He had always been anxious for good relations with Germany, provided that they were not attained at the expense of France; for, like Sir Edward Grey, he based his whole foreign policy on the maintenance of the Entente, and therefore supported the Foreign Secretary steadily against Radicals and Labour men and Nationalists. The only quarrel he had with the increased armaments proposed by Mr. Churchill was that he doubted whether they were adequate. Accordingly, directly the crisis became acute, he wrote, on Sunday Aug. 2, on behalf of Lord Lansdowne and their colleagues, tendering to Mr. Asquith the unhesitating support of the Opposition in any measures necessary to support France and Russia; and he warmly welcomed Sir E. Grey's speech of Aug. 3, which converted the country to the justice and inevitableness of war. Not only did he render a steady support to Ministers in Parliament, but he aided the national cause and promoted recruiting by speeches at Guild-

hall, in Belfast and elsewhere; and even when criticism of the mismanagement of the war began legitimately to raise its head in the early months of 1915, he used his influence, in the national interest, to repress or moderate its expression in Parliament. The tenor of his speeches was always to encourage Ministers in vigorous action—on such questions, for instance, as the mobilization of industry, the treatment of aliens and the provision of munitions. In spite, therefore, of the vigour, or even violence, of his opposition before the war, it was comparatively easy for Mr. Asquith to approach him in May 1915 with a view to the formation of a National Coalition Government, and for him to respond with immediate acceptance. He believed, he subsequently told a Unionist audience, that the Opposition could have turned out the Government at this time owing to the indignation about the shortage of munitions; but that would have meant an election and renewal of party feeling, and so have prevented the concentration of effort on the war. He brought seven of his colleagues into the Cabinet with him—Lord Lansdowne, Mr. Balfour, Mr. Austen Chamberlain, Mr. Long, Lord Curzon, Lord Selborne and Sir Edward Carson—and he himself took the Secretaryship of State for the Colonies. This was an office which, however congenial to Mr. Law with his colonial birth and his belief in Colonial Preference, did not bring him much into the limelight; and, influential as he was in the councils of the Ministry, in public he was content to play a comparatively subordinate part. To his loyalty to his chief, during their 18 months' association, Mr. Asquith himself subsequently bore emphatic testimony. While the controversy on compulsory military service was raging in the late autumn of 1915, he stated his own view to be that it was a better system than the voluntary system, but could only be gained at too high a price—namely, the price of national unity. But when circumstances had overcome Mr. Asquith's antipathy to compulsion, Mr. Law took charge of the first military service bill in the House of Commons in Jan. 1916, and got it through all its stages with little difficulty. Another policy which he threw his energies into carrying out was the utilization of the economic forces of the Allies in the prosecution of the war. He promoted the Economic Conference in Paris in June 1916, and represented his country on the occasion, with Mr. Hughes, the Australian Premier, and Lord Crewe as his colleagues. He cordially concurred in the coöperative and protective resolutions then adopted (*see* ENGLISH HISTORY) and joined Mr. Asquith in recommending them to the House of Commons. He was a member of the War Committee of the Cabinet, but, like Mr. Lloyd George, he was far from satisfied with its organization and powers. It was natural, therefore, that he should be one of the four persons (the others being Mr. Lloyd George himself, Sir Edward Carson, and a Labour member) to whom Mr. Lloyd George, forcing the issue on Dec. 1, asked Mr. Asquith to confide the absolute conduct of the war. The crisis started by this demand produced, in the course of a few days, first Mr. Lloyd George's and then Mr. Asquith's resignation; and the King, adopting the ordinary constitutional course, sent on Dec. 5 for Mr. Bonar Law, who had become, through by-elections before the war, the leader of the largest single party in the House of Commons, and invited him to form an administration. He took the view that for the due prosecution of the war a Coalition Government was necessary. He could count on the assistance of Mr. Lloyd George, but Mr. Asquith and his principal Liberal colleagues refused their coöperation. Moreover, he felt that Mr. Lloyd George was the Minister whom the country demanded. So he resigned his commission, and on Mr. Lloyd George's acceptance of the premiership he promised full coöperation from his party.

In this second Coalition Mr. Law's position was much more considerable than in the first. His followers supplied the main body of its supporters; and he himself was rather the partner of his chief than his second-in-command. He became not merely Chancellor of the Exchequer, but also leader of the House of Commons, the Prime Minister concentrating his energies on the work of the War Cabinet (*see* ENGLISH HISTORY), the supreme directing authority, of which Cabinet Mr. Law was also a member, though he was not expected to give regular attendance. At first the House of Commons was disposed to resent the apparent neglect with which it was treated by being asked to accept a deputy as its leader in place of a Prime Minister who was himself an M.P.; and cries for "Lloyd George" were raised when Mr. Law rose to play the leader's part in the debate on the Address in 1917. But the respect and, after a while, even the affection of the House were won by his business habits, his courtesy, his readiness to yield on non-essentials coupled with firmness in essentials, his exceptional clearness of head and of expression, and his extraordinary capacity for impromptu reply, without taking a note, at the close of a long debate on an intricate subject involving perhaps complicated figures.

It was his duty to obtain votes of credit from time to time from Parliament to carry on the war; and in the two years for which this Government was responsible the total voted amounted to more than £5,500,000,000, as compared with some £3,200,000,000 during the preceding period of two years and four months. But of course it must be remembered that not merely were munitions provided in 1917 and 1918 on an unprecedented scale, but that prices had risen enormously until, towards the close of the war, they were about double those of four years before. As Chancellor of the Exchequer Mr. Law had to find the money to meet this gigantic cost. This he did principally by means of two great loans, and by immense increases of taxation. The first loan was launched in Jan. 1917, and its basis was the issue of a 5% Government stock at 95; but there was also a 4% tax-compounded loan issued at par, and there were various provisions for conversion of certain previous issues. It brought in the enormous sum of £1,000,312,950 from no fewer than 5,289,000 subscribers; and Mr. Law justly hailed it both as an expression of the will of the people to win the war and also as evidence of the financial ability of the country to see it to a successful conclusion. The second loan, which was launched in Oct. of the same year, was of a new and ingenious character. The title of the issue was National War Bonds, and it combined the advantages of short-term securities, such as Exchequer bonds, and three sorts of longer-dated securities for seven and ten years. The interest was, as before, 5%, or 4% "tax-compounded," and elaborate and comprehensive rights of conversion were given. The amount was unlimited; all the securities were for continuous sale till further notice. Mr. Law explained that his hope was that the new War Bonds would lead to a steady and persistent flow of money loaned to the State without the financial dislocation inseparable from a great loan. His hope was justified. Interest was stimulated in the National War Bonds by various devices from time to time, such as the use of "tanks" as collecting boxes, the institution of a "Business Men's" week and a "Feed the Guns" week, and the transformation of Trafalgar Square in Oct. 1918 into a shell-shattered French village. From the time they were first put on sale till Jan. 11 1919, £1,446,625,613 of these bonds were sold, and nearly £50,000,000 small post-office bonds in addition.

Mr. Law's first budget, that of 1917, coming as it did after the great increases which Mr. McKenna had made in taxation, only raised the excess profits tax from 60 to 80%, and increased the taxes on entertainments, tobacco and dogs. He had proposed to double the tobacco duty, but on reconsideration came to the conclusion that with this burden it would be impossible to keep down the price of the cheaper kinds, and so reduced the additional duty to one of 50%. His great taxing budget was that of 1918, introduced during the early stages of the great German offensive. This imposed additional taxation calculated to bring in no less than £114,000,000. Income-tax was raised from 5s. to 6s.; farmers' tax was doubled; super-tax was increased; the stamp on cheques was to be 2d. instead of 1d.; beer and spirit duties were doubled, and tobacco and match and sugar duties raised; letters were to be 1½d. and postcards 1d. He budgeted for a revenue of no less than £843,500,000. He explained that it was his duty to levy as much as the nation could bear; but at the same time he must not cripple industry. Besides the taxes already mentioned, all of which were carried

through; there was considerable opposition to the increased tax on cheques. Mr. Law also proposed a tax on luxuries, following the general principles adopted in this matter by the French Government. He got the House to set up a select committee to prepare a schedule with the advice of the traders who would be affected; but the report of the committee was not received sufficiently early in the year to enable Parliament to pass upon it, and the project was abandoned. He also appointed another select committee to consider how to control expenditure, the chairman of which, Mr. Herbert Samuel, told him that his fault as a Chancellor of the Exchequer was that he was "too amiable." The fault that the City of London found with him was that he was too much occupied as Leader of the House and member of the War Cabinet to give sufficient attention to finance.

His influence in the Government was especially felt in economic questions. It must have been with peculiar gratification that he announced to the House of Commons in April 1917 that the Imperial War Cabinet had accepted the principle of Imperial Preference; and that it was hoped that each part of the Empire, having due regard to the interests of the Allies, would give specially favourable treatment and facilities to the produce and manufactures of other parts of the Empire—a hope which, as regards the mother country, was translated into action in the budgets introduced under Mr. Law's leadership after the war. After the sittings of the Imperial War Cabinet in 1918 he spoke of the resolutions then passed in favour of retaining the control of essential raw materials as an immense move forward in the whole conception of trade policy. In May 1918 he told the House of Commons that the French Government had denounced all commercial conventions containing "most-favourable-nation" clauses; and that, in view of the probable scarcity of raw material after the war, the British Government would take a similar course. He had warned the German Government in the previous Dec. that the longer war lasted, the less raw material there would be to go round, and, as the Allies would help themselves first, the less there would be for Germany to receive. In regard to Ireland, he frankly admitted, Unionist though he was, the need for a change. What was wanted was a settlement, but the sacrifices would have to be on all sides if a settlement was to be obtained. He remonstrated, however, with the Nationalists for their threats in the session of 1918 and indignantly rejected as preposterous their claim to self-determination as a condition precedent to the entry of Britain into the Peace Conference. He opposed throughout the war a firm front both to pacifists and to pessimists. He asked the pacifists what other method there was, in the circumstances, of saving the liberties of the country except by fighting for them; and the constant readiness of his countrymen to bear the heaviest taxation and to subscribe to loan after loan was again and again treated by him as a certain pledge of eventual victory. Nor was he ever in doubt as to the necessity of fighting until the Germans surrendered. "We are fighting," he said, some six weeks before the Armistice, "for peace now and for security for peace in the time to come. You cannot get that by treaty. There can be no peace until the Germans are beaten and know that they are beaten."

As the general election approached he responded heartily to Mr. Lloyd George's proposal that the Coalition should be continued, and that the country should be definitely invited to return candidates who should undertake to support the Coalition Government; and he joined with him in issuing the letters or certificates, nicknamed "coupons," accepting Coalition candidates. He also signed with Mr. Lloyd George a joint manifesto, in which a good measure of his own economic doctrines held a conspicuous place. He left Bootle and stood for Central Glasgow, the business quarter of his own city, being returned by a huge majority. The result of the general election greatly strengthened his position, as the Unionists had a considerable predominance in the new House of Commons.

When the Ministry was reconstituted in Jan. 1919 the arrangement by which Mr. Law led the House of Commons was continued, as the Prime Minister would be much away at the Peace Conferences; but he was relieved of the Chancellorship of the Exchequer, which was transferred to Mr. Austen Chamberlain, he himself taking the sinecure office of Lord Privy Seal. He was constituted one of the British plenipotentiaries at the Conference; but his duties at Westminster seldom allowed him to go to Paris, though he ultimately affixed his signature to the Treaty of Versailles. The business of the session mainly consisted of measures either to demobilize the forces which had been mobilized for the war and restore previous peace conditions, or to improve the social condition of the people in accordance with the pledges of the joint leaders' election manifesto. Mr. Law's handling of the business of the House was, as ever, efficient and conciliatory; but for the greater occasions Mr. Lloyd George returned; and Mr. Law's most outstanding appearance in this session was when he announced that the Government were prepared to adopt the Sankey report in the spirit as well as in the letter, and to take all necessary steps to carry out its recommendations without delay. This was said of the first report, which contained no decision on nationalization; but it was afterwards unfairly alleged by Labour speakers that the Government, by refusing to accept the principle of nationalization, approved in a subsequent report, had broken Mr. Law's pledge. The main business of the session of 1920 was the Irish Home Rule bill, which Mr. Law justified as giving to Ireland the largest measure of self-government compatible with national security and pledges given. He strongly upheld in the House of Commons the measures taken, first by Mr. Macpherson and then by Sir Hamar Greenwood, to restore law and order in that country; and definitely refused to interfere in the case of the Lord Mayor of Cork who, sentenced to imprisonment for conducting a rebel organization, went on hunger-strike and eventually succumbed in gaol. The affection in which Mr. Law was held by the House which he led was shown this session in a peculiarly happy manner. The members, with few exceptions, subscribed to give a wedding present to his daughter on her marriage to Maj.-Gen. Sir F. W. Sykes, Controller-General of Civil Aviation.

Mr. Bonar Law was whole-heartedly in favour of the Coalition, and frequently adjured his Conservative friends to remain true to it. In its cause he sacrificed his health. In March of the following session, that of 1921, while he was in the full swing of his multifarious activities, he suddenly broke down, and was recommended by his medical advisers to abandon his work at once. The shock to the public, to the House of Commons, to his party, and to Mr. Lloyd George was great; and genuine expressions of regret were heard on every side. Mr. Lloyd George seemed almost unmanned in telling the news to the House; and it was clear that he felt that a great prop of his Government had fallen. Mr. Law resigned office, but not his seat for Glasgow. He went away immediately to rest in the south of France; and his health rapidly improved, so that by the autumn he was well again. He married in 1891 Annie Pitcairn, daughter of Harrington Robley, of Glasgow, by whom he had a family; but he was left a widower in 1909. Two sons perished in the World War. (G. E. B.)

**LAWES-WITTEWRONGE, SIR CHARLES BENNET,** 2ND BART. (1843–1911), English sculptor, was born at Teignmouth Oct. 3 1843. The only son of Sir John Lawes of Rothamsted (*see* 16.300), he was educated at Eton and Cambridge, where he was a notable athlete. Subsequently he devoted himself to sculpture, while doing much also to further the scientific side of the Lawes Agricultural Trust, founded by his father, of which he was chairman. In 1882 he was defendant in a famous libel action, brought by another sculptor, Mr. Belt, for a criticism published in *Vanity Fair*, imputing dishonesty to Mr. Belt in taking credit for work done by another man. The question of how much a sculptor may be aided by others in work to which he attaches his name was inconclusively debated through a long and costly trial, and the verdict of the jury, awarding £5,000 damages to the plaintiff, was much discussed at the time. He died at Rothamsted, Herts., Oct. 6 1911.

**LAWLESS, EMILY** (1845–1913), Irish novelist and poet, was born at Lyons, co. Kildare, June 17 1845. She was the

daughter of the 3rd Baron Cloncurry and wrote a number of novels and verses dealing with Irish life. Of her novels *Hurrish* (1886), *With Essex in Ireland* (1890) and *Grania* (1902) are the most important, and of her verses *With the Wild Geese* (1902) is the best-known volume. She was given an hon. degree at Dublin University in 1905. She died at Gomshall, Surrey, Oct. 19 1913.

**LAWRENCE, THOMAS EDWARD** (1888– ), British traveller, archaeologist and soldier, was born in Wales Aug. 15 1888, and educated in Jersey and at Dinard as well as at the High School, Oxford, proceeding on to Jesus College, Oxford, and graduating 1st class in modern history 1910. He went the same year to Carchemish on the Euphrates, as assistant in the British Museum's excavation of that ancient Hittite site. There he was still working when the outbreak of the World War and the decision of Turkey to join the Central European Powers put an abrupt stop to all archaeological work and called Lawrence to what proved a wider field. From Oct. to Dec. 1914 he worked at home in a department of the War Office. In 1915 he went to Egypt as a staff captain. The following spring he was in Mesopotamia at Army Headquarters, whence he returned to Cairo as intelligence officer for the Mesopotamia expeditionary force. In the autumn he was attached to the Arab Bureau at Cairo, under Lt.-Comm. D. G. Hogarth, being then a staff captain on the Foreign Office list, not under War Office control. In that capacity he was attached in 1917 to the staff of Gen. Sir F. Wingate, the general in command of the Hejaz expeditionary force. This gave Lawrence his great opportunity. He possessed, to an extraordinary degree, a power of getting into intimate association with the Arabs of the desert, such as has belonged to but one or two of his predecessors in Arabian travel, and he combined with this gift the soldier's instinct and a capacity for leadership which raised him at once to the first rank of commanders in desert warfare. The story of how he raised and led a force of Arabs, which cut the Hejaz railway, pushed forward in the van of Allenby's advancing army and were first into Damascus, is but faintly reflected in the dry official record of his various promotions to major (Aug. 1917) and lieutenant-colonel (1918), when he was transferred to Gen. Allenby's staff.

To decorations and official recognitions he was notoriously indifferent. He was a Prince of Mecca, a Chevalier of the Legion of Honour, the holder of the Croix de Guerre (with palms), the Italian silver medal and various British war medals. But what he cared for was the cause of the Arabs, whom he had learned to know and admire, and for whose interests he pleaded at the Paris Peace Conference in 1919. In that year he was demobilized and retired into academic life, being elected to a research fellowship at All Souls College, Oxford. Unofficially he remained in frequent touch with the Emir Faisal; but he did not reëmerge officially until March 1921, when Mr. Winston Churchill, on succeeding Lord Milner at the Colonial Office, appointed Lawrence to be his adviser there on Middle Eastern affairs, with a view to the subsequent creation of a special department dealing with them.

**LEAGUE OF NATIONS.**—The Covenant of the League of Nations, incorporated in the Peace Treaty in 1919, was perhaps the most remarkable of all the direct results of the World War.

The League of Nations may be regarded as a necessary result of the development of human society in political organizations. It is not an abnormal achievement of human idealism—a great leap in advance beyond the achievements of the present age, outstripping the practical needs and requirements of the world. On the contrary, it is a practical method for achieving practical ends which are of importance to every citizen of every country. The demand for an international organization to prevent war has often been made in the last four centuries after any great European conflict. Fundamentally, this demand is that the relation of these States among themselves shall be subjected to something analogous to the system of law and order to which men have subjected themselves within the smaller units in which they live. It is an illustrative commentary on the maxim of the Roman lawyers—*ubi societas ibi lex*. But the purpose and the content of these rules for the conduct of their relations—the *lex*—necessarily depend on the nature of the units of the society and on the nature of their relations. When Grotius, for example, wrote his famous work on the Law of Nations, he was writing of a Society of States whose intercourse was disturbed by the continual outbreak of hostility. Indeed, Europe had been convulsed by the Thirty Years' War for a whole generation prior to the publication of his work. Thus it was natural and indeed inevitable that the rules which Grotius produced for the guidance of the Society of States, as he knew it, amounted to little more than a code of laws for the better conduct of war. He did indeed sketch the outlines of a law for the pacific relations of States, and in the following century and a half his successors developed to some extent what he had begun. But only after the Napoleonic wars was the first serious attempt made to establish an organized system of conducting international affairs with a view to the avoidance of war. To Alexander of Russia's scheme of a Holy Alliance we need only briefly allude. Though admirable in intention it was rejected as "sublime nonsense and mysticism" by Castlereagh, and it eventually degenerated into a mere prop of despotism supported by the empires of Central Europe and France. But the work of Castlereagh is worthy of closer attention. He tried to substitute for the chaotic political methods of the past a system of diplomacy by conference, confining his efforts, however, to the Great Powers; though he desired to make their attitude to the Smaller Powers one of "influence rather than authority." He provided his "Conference of Ambassadors" with an organized plan of work and with a secretariat, and he supplemented it by occasional Conferences of the Principal Statesmen of the Concert. His Conference of Ambassadors continued to sit in one form or another for almost six years, and he held four or five of his Conferences of Principal Statesmen.

Later in the 19th century Castlereagh's work bore fruit in the European Concert, which proved on a number of occasions to be an effective instrument for the joint settlement of Balkan problems and for the maintenance of European peace. But at the time, and for the purpose for which he had created it, Castlereagh's system of diplomacy by conference almost completely failed. It did so because it never had in it the seeds of life. Its members differed fundamentally on all the greater issues of international politics; while some of them were independent and autocratic sovereigns, subject to no control, and without the pressure behind them of a general democratic will for peace. Indeed the paramount cause of failure, not only of the vague and mystic ideas of Alexander, but also of the more practical and definite schemes of Castlereagh, was that they were not backed by the force of a strong, persistent, instructed public opinion.

Since the Napoleonic wars, forces have been at work which have slowly changed the economic condition of the world—knitting its many parts together, and making more and more possible an international political organization, which shall exist side by side with the economic organization already created. The first of these forces is the revolution in communications which has occurred in the course of the last century, and which has brought the most remote parts of the world nearer to each other than neighbouring towns were a hundred years ago. The second of the forces—in a sense it is the result of the first—is the remarkable raising of the standards of civilization through the coöperation of mankind in ever larger groups and in enterprises conceived and conducted on an ever greater scale. To-day no part of the world can live without the rest; and a greater proportion of the world's commerce is conducted by vast international companies. Thus we have a general community of interests between human beings living in different States. It was evident before the World War—and if it were not, the war proved it to demonstration—that the interests of any one civilised country are indissolubly bound up with those of every other country, and no sensible statesman will ever again base his policy on the principle that his country will gain by another's loss.

Nor is this community of interests between peoples confined to their material well-being. It extends to every sort of scientific, political and moral activity in which men coöperate for the progress of their race. The revolution in communications, which is still in progress, rapidly destroying the factors of space

and time, has rendered possible a development of warfare which has changed its whole character, and rendered it universal in a sense never hitherto imagined. Withal, "science," as Lord Esher remarks, "sleepless, restless and revolutionary, is exploring every day new methods of destruction, and opening up avenues to novel tactics, rendering certain that war in the future will be waged with weapons hitherto undreamt of, fought in the air and under the water by contrivances which will render those of 1918 as obsolete as gunpowder rendered bows and bills." Thus it is not too much to assert that another world war would almost certainly throw mankind back into the dark ages. For these among other reasons some sort of international organization for the conduct of the relations of States is essential, if the human race is not to abandon the hopes and the ideals for which it has striven during centuries of progress.

*Essential Conditions.*—With the reasons for the failure of the earlier scheme of a century before, and with the nature of modern national States in our minds, we can perhaps now proceed to lay down the essentials of a league of nations.

It may be taken as commonly accepted that the purposes and objects of a league are the following:—First, the maintenance of peace. Second, and as a corollary to the first, the solution of international disputes by methods of law, if and when the necessary law exists; when it does not, their solution by political methods, by public debate, by impartial investigation and by conciliation on the basis of the accepted canons of right and justice. Third, the promotion of international coöperation wherever necessary or useful, between States and between the citizens of different States. The promotion of such coöperation will imply the development of rules and the general acceptance of common machinery and common practice in ever wider spheres of international activity. Further, a first principle which must be borne continually in mind is that the fundamental basis of all law, and the primary condition of all political organization, is the consent of those who are to obey it. And an important and relevant corollary of the proposition is that the force, even the united force, of the greater or more powerful members of a society cannot in the long run coerce the will, or replace the consent, of the others. It is useless, therefore, to plan any organism which depends on the coöperation of the powerful States, but which will not also receive the willing acceptance and coöperation of the great body of other States.

An examination of the results of these limiting conditions, and of the lessons to be drawn from historical experience, and of the accepted objects which it is desirable that a league should achieve, will perhaps indicate to us without further discussion the minimum of rules and of machinery which is essential.

In the first place, then, there must be rules laying down the conditions of membership of the League. As the members of the League, in order to carry out the objects which they agree upon, must give reciprocal undertakings, they must have some guarantee that those with whom they associate themselves are willing and able to carry out what they promise. Next, it is essential that all the members should enter into agreements to meet in full conference from time to time. Third, it will in practice be necessary, and even in theory it is most desirable, that there should be some smaller organ than the full conference of all the members, which in the current business of the League, and when executive action is required, can represent the whole body of the members. It is evident that the composition of such an executive organ will—in a society in which members are so unequal in size, population and power—involve most difficult problems of representation. And a further consequence of any attempt to organize international affairs through regular conferences of all the members of the League, and through a smaller executive organ, is the necessity for a secretariat which shall be charged with the duty of preparing the work of the organs of the League, which shall act as a central exchange for information among members of the League and shall organize the central and technical services for conferences and for the meetings of the executive organ. The secretariat would also have to keep the records of the League, supervise the execution of the League's decisions and in general act as an organizing agency for the promotion of international coöperation. It is, perhaps, theoretically possible that these duties should be fulfilled by means of national secretariats attached to the representatives who compose the full conference or the executive organ of the League; but there are great practical advantages in an international secretariat whose members are individually independent.

The above represents the minimum machinery that is essential to the effective working of any league. We must next consider the minimum mutual obligations which the members of the League must assume if it is to prove an effective instrument for the maintenance of peace.

It is evidently essential that every member must agree that it will not go to war with any other member without previously submitting the dispute to peaceful methods of settlement, either through the instrumentality of the League or otherwise. Further, and as a corollary to this first undertaking, there must be a second one providing for common action against members who break this fundamental agreement. What the nature of this common action must be is a matter for discussion; but it must at the least provide for united and energetic moral pressure by the whole body of the League against the recalcitrant member. It may well be argued that in the world as it is to-day this united moral pressure should be supported in whatever way may be possible by united material pressure as well. What in any case is essential is to find some means of bringing home to every citizen of a member which breaks its League agreements the universal disapprobation of the other members. Thirdly, it is practically, if not theoretically, necessary to lay down in advance some method, or methods, for the settlement of disputes by peaceful means. Great elasticity may be left as to the nature of these methods, and as to the choice of method which the parties to a dispute may adopt. But the agreements of the League should include plans for settlement by conciliation, or arbitration, or judicial verdict; and these plans should be based on the essential principles by which alone moral pressure can be brought to bear on individuals or on Governments—that is to say, on strictly impartial inquiry into the merits of disputes, and on full publicity for the contentions of the parties and for the proceedings by which settlement is attempted.

It is further essential that the agreements of the League should include the automatic abrogation by members of all treaties or undertakings which are not consistent with their obligations as members of the League. No general organization such as a league of nations can operate or inspire confidence in its members if the undertakings to which they agree by their membership are overborne or superseded by other inconsistent agreements which they may enter into with individual States.

The organization and the undertakings indicated seem to constitute the minimum that can serve as the basis of any effective international organization for the prevention of war. Beyond this minimum, there are other things not absolutely essential, but highly desirable. For example, in the plans laid down for the settlement of disputes, it is necessary to make provision for settlement by conciliation, by arbitration and by judicial verdict. The last of these alternatives implies a court of international law. It is true that such a court might be set up *ad hoc* for any dispute in which it is required. But it is preeminently desirable that a permanent court of international justice should be established as part of the machinery of the League. Only such a permanent court can guarantee the full, absolute and unquestionable impartiality without which States will not submit their disputes to its jurisdiction. Further, such a court appears to be a necessity if we are to achieve the development of international law as an increasingly important factor in the relations between States.

Again, it is highly desirable, though it is not theoretically essential, that the agreements of the League should provide that any dispute, or any circumstances affecting the peace of the world, should be a matter of general concern to every member, so that any member may be within its right in demanding the consideration of any such matter by the organs of the League.

Interdependence of States had so far advanced during the course of the 19th century that this principle received some slight and tentative recognition in the international conventions for the peaceful settlement of international disputes drawn up by the conferences at The Hague. But the principle needs full recognition and application if countries are to be prevented from drifting into armed conflicts which, in these times, certainly will involve the interests of their neighbours.

And lastly, it is desirable, though again not essential, that the League should be given the necessary powers to enable it to act as the coördinating agency for the international activities of its members in all the multifarious spheres hitherto governed by international bureaux, by general treaties, and by other forms of official and unofficial coöperation.

*Features of the League.*—Impartial consideration of the Covenant of the League, first signed by the 32 signatories of the Treaty of Versailles, and accepted and acted upon by the 48 States who in 1921 were members of the League, will show that it embodies every one of the features which have been enumerated as the essentials of an effective league. It may further be said that where the Covenant goes beyond the essentials it does so in a way which was intended to make, and does make, for greater completeness and efficiency.

Article 1 of the Covenant consists of the rules of membership. It stipulates that the original members of the League shall be the signatories to the Covenant and such other States named in the annex thereto as shall accede to it without reservation; and that any fully self-governing State, dominion or colony may become a member if its admission is agreed to by two-thirds of the members, and provided that it shall give effective guarantees of its sincere intention to observe its international obligations and shall accept the regulations of the League in regard to its military forces. Article 1 also makes provision for the withdrawal after two years' notice of any member who wishes to abandon its membership. These rules constitute a statement of the principles concerning membership that are essential if the members of the League are to have confidence that their mutual undertakings will be carried out.

With regard to agreements to meet in conference, Articles 2, 3 and 4 of the Covenant stipulate for the creation of an assembly consisting of three representatives of each member of the League, and for a smaller council consisting of representatives of four Great Powers and of four smaller ones. The Covenant does not lay down the intervals at which these bodies shall meet: it merely stipulates that the Assembly shall meet at stated intervals and from time to time as occasion may require; and that the Council shall meet in the same way, and at least once a year. It leaves these questions to be dealt with in whatever rules of procedure the Council and the Assembly may respectively consider it wise to adopt.

The question of representation of the members at the Assembly was one which naturally involved serious difficulties. It was solved by according to every member an equal right to send three representatives. There was considerable discussion when the Covenant was being drafted as to whether three was a sufficiently large number. In practice this point has been dealt with in a way indicated later on.

The question of representation on the Council was still more difficult. A definite preponderance of influence in international affairs had been recognized prior to the war on the part of the Great Powers of the world. It was inevitable, and surely right, that the Great Powers who are members of the League should be accorded permanent representation on its principal executive organ, and this has been done. The representation of the smaller Powers—an exceedingly difficult matter—was dealt with in a way which in practice seems likely to prove quite satisfactory, namely by providing that the four non-permanent members of the Council shall be selected by the Assembly from time to time in its discretion.

Articles 6 and 7 provide for the necessary secretariat, and for the nomination of a secretary-general who shall make all the appointments to the secretariat with the approval of the Council, and who shall act as secretary at all the meetings of the Assembly and of the Council. These Articles also provide that every position in the secretariat shall be open to women.

So much for the institutional organization of the League as it is established by the Covenant.

With regard to the agreements not to resort to war, which are included above among the essentials, the Covenant embodies practically everything that any responsible authority had advocated as practicable. By Article 12 the members agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to inquiry by the Council, and they agree that they will in no case resort to arms until three months after an award has been made by the arbitrators or a report has been made by the Council. Article 12 thus not only embodies an agreement not to go to war without previous recourse to peaceful methods of settlement for disputes, but also lays down two alternative procedures by which, through the agency of the League, settlement can be effected. The first is ambiguously referred to as "arbitration," but it is evident from Articles 13 and 14 that the use of the word "arbitration" is a loose one, and that what is really intended is recourse to legal decision. For Article 13 proceeds to give a definition of disputes which the members recognize to be "generally suitable for submission to arbitration"; and this definition is textually that agreed to by various high authorities in international law as the best that can be devised for disputes which may be called "juridical," *i.e.* suitable for decision by means of legal verdict. Further, while Article 13 leaves the parties free to choose any court or board of arbitration to which they may agree for the judicial settlement of their disputes, Article 14 nevertheless charges the Council with formulating, and submitting to the members of the League for adoption, plans for the establishment of a permanent court of international justice which shall be competent to hear any dispute of an international character which the parties thereto submit to it. While, therefore, these two Articles leave great elasticity, it is evident that the intention was to lay down a normal legal procedure, and to secure the establishment of a permanent international court to which the parties should, in the normal course, take disputes of a legal nature. There is, moreover, at the end of Article 14 a clause which greatly increases the value of the Permanent Court. This clause provides that the Court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly. It is evident that in the course of a dispute one party may maintain that a whole or a part of the question at issue is juridical in nature, and should be determined on legal grounds. If one of the parties put forward such a contention and were able to support it by sound arguments, there is no doubt that the Council would act on the final clause of Article 14 and would submit the question to the Court for an advisory opinion; and it is to be particularly noted that they could do this as a matter of procedure, and, therefore, by a majority vote. If, then, a litigant should bring to the League a dispute in which it believes the law to be on its side, it will be able to demand, even if the other party does not agree, that the Council shall secure on the juridical questions at issue an advisory opinion from the Court: and the Court in rendering this opinion will give the Council the elements for a decision which would have all the force of a legal verdict.

Thus, while avoiding the pitfall of "obligatory arbitration," which very few of the States of the world at the present time are ready to accept, the Covenant includes provisions which go very far towards securing that all international disputes of a genuinely legal nature shall be determined by legal methods.

With regard to the other alternative method provided for the settlement of disputes, which members agree to by Article 12, that is to say, inquiry by the Council, Article 15 lays down in considerable detail the procedure which is to be adopted. It provides that any party to a dispute can oblige the League to take cognizance of it by giving notice to the Secretary-General, who is then obliged to make all the necessary arrangements for a full investigation and consideration thereof. The parties under-

take to communicate to the Secretary-General as promptly as possible statements of their case, with all the relevant facts and papers. The Council is then given discretion to endeavour to effect a settlement of the dispute, and it is provided that if its efforts are successful, a statement shall be made public giving such an account of the dispute and of the settlement arrived at as the Council may deem proper. If the Council fails to settle the dispute, it is to make a report setting forth the merits of the dispute and the recommendations which the Council thinks would be suitable for a settlement, and this report is to be published. A report may be made either unanimously or by a majority vote, and any individual member of the League which is represented on the Council has a right to make its own public statement concerning the dispute and the conclusions which it draws from them. There is a further provision in Article 15 to the effect that if such a report is agreed to by the Council unanimously, with the exception of the representatives of one or more of the parties to the dispute, the members of the League—including the parties—agree that they will not go to war with any party to the dispute who complies with the provisions of the report. This is a most important additional limitation of the right of members to resort to arms. Article 15 also provides for an appeal to the Assembly, conditional on its being made within 14 days after the submission of the dispute to the Council. If a dispute is so referred to the Assembly, the Assembly is to deal with the matter in the same way as the Council, with this exception, that if a report is agreed to in the Assembly by all the members of the League represented on the Council, and by a majority of the other members of the League, exclusive in each case of the representatives of the parties to the dispute, the report shall have the same force as a unanimous report agreed to by the Council. In other words, the members of the League must not go to war with any of the parties to the dispute which accept it. These Articles, then, provide two, or rather three, methods by which disputes can be settled by peaceful means through the agency of the League. The first of these methods provides for legal verdicts, when such verdicts are possible and useful; the second provides for arbitration by some other tribunal agreed to by the parties to a dispute; and the third, for settlement by the political agency of the Council or the Assembly, in accordance with procedure based on the principles of full publicity and strict impartiality. It may perhaps be observed that publicity will of itself ensure impartiality; for it is not conceivable that a council, acting as the representative of the whole body of the League and in circumstances of utmost publicity, should conduct its inquiries into a dispute in any way not consistent with the strictest fairness to all the parties concerned.

Articles 12 to 15 also make provision for the next essential of a league—united pressure by all the members against any of their number which disregards its undertakings. In providing for a public report by the Council on the merits of a dispute and for the publication of its recommendations as to a settlement, the Covenant lays down a method which, in practice, must exert the strongest moral pressure on any State which in defiance of Article 12 is disposed to go to war. Anyone who knows how great a factor in the conduct of international affairs the public opinion of the Society of States was, even prior to 1914, will realize that such a verdict of the organized opinion of the world is bound to be a weapon of great power.

But the Covenant goes beyond this, and provides in Article 16 that, if any member of the League in contravention of its agreements resorts to arms, such a member is *ipso facto* "deemed to have committed an act of war against all other members of the League," and the other members are obliged to prevent all financial, commercial or personal intercourse between the nationals of the Covenant-breaking State and the nationals of any other State. It was difficult in the disturbed condition of the world during 1919–21 to realize just what would be the effect of such a complete economic and financial boycott in times of normal peace. But it is not too much to say that no civilized State would, in 1914, have ventured to declare war had it been threatened by such a universal boycott as Article 16 stipulates.

It may be held that in providing for such a universal boycott, the Covenant goes beyond the essentials of a league. It may even be held that it goes beyond what is practicable and wise. Certainly it is a matter which will give rise to the gravest problems, and on which, indeed, the League had in 1921 already found it necessary to appoint a commission to determine the precise obligations of the members and to recommend the machinery required for their fulfilment. But it must be remembered that Article 16 only comes into force in the case of a State insisting on going to war without waiting for any attempt at peaceful settlement such as is provided for in Articles 12, 13 and 15, or where the agreed tribunal or a unanimous council have given a decision which has been accepted by the other party. In other cases ultimate resort to war is envisaged as possible.

And the Covenant goes even further than this in making provision for pressure on recalcitrant members of the League.

Article 16 further lays down that in addition to the blockade, which is an automatic obligation of all the members of the League, the Council shall consider and shall *recommend* to the several Governments concerned, what effective military, naval or air forces members of the League shall severally contribute to the armed forces to be used to protect the Covenant. In other words, while leaving again the greatest possible elasticity, and while laying no positive obligation on any member to contribute military force, the Covenant yet definitely foreshadows united military action against a Covenant-breaking State.

To turn to another matter, the Covenant provides by Article 20 for the abrogation of treaties, obligations and understandings which are inconsistent with its own terms, and thus meets, in yet another particular, the essentials of a league.

How far, and in what respects, does the Covenant go beyond what we have recognized to be these essentials?

To begin with perhaps the most important point of all, there are the much-discussed provisions of Article 10. This Article has been very generally misunderstood. It has been widely proclaimed as containing the central and essential obligation of the whole Covenant—an obligation, moreover, which most States are unlikely to accept in practice and which, indeed, they would be right in refusing. This is quite untrue. As a matter of fact the great objection to it is that it has little actual effect while appearing to mean a great deal. It does not create, as has been thought, an obligation on all the members of the League to maintain by force of arms the existing territorial and political arrangement of the world. It does indeed guarantee the members *against external aggression* which would impair their territorial integrity or political independence. But this guarantee is only to be enforced, if at all, as the Council acting unanimously shall agree. In practice the protection against sudden and unjust attacks provided by Articles 12–16 will be much more useful. Article 10, when closely examined, will be found to be little more than a rather clumsy assertion that territorial or political changes ought not to be made by aggressive warfare. Such changes, if required, should be made under Article 19, which enables the Assembly to reconsider treaties which have become obsolete or dangerous to peace.

It may perhaps with more show of reason be said that, by the provisions of Article 8 on the subject of armaments, the Covenant introduces something which is extraneous to an agreement to preserve the peace. But the history of the 20th century has already demonstrated that if you prepare for war you will have war; that increase of armaments in one country provokes increase of armaments in other countries, and that if rivalry in preparation for war continues, within a certain time war will break out. Unless the rivalry in armaments can be prevented, any league of nations, however it be constituted, will fail. Doubtless complete disarmament is not practicable or probable at an early date. But an agreement not to engage in unlimited competition on the development of armaments is absolutely necessary to the peace of the world. The Covenant deals with the matter in a way which is preëminently practical and sane. It recognizes that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national

safety and directs the Council to formulate plans for such reduction for the consideration of the several members of the League. In other words, the members agree to coöperate in working out a general international plan embodying scales in accordance which with their armaments shall be limited or reduced. Further, the members agree that they will, through the League, endeavour to take measures for abolishing the evil effects of the private manufacture of armaments and material of war, and they agree to exchange full information as to their armaments, their preparations for war, and the condition of their industries which may be adapted to warlike purposes. Lastly, by Article 23 they agree that, subject to conventions to be arranged, the international traffic in arms, admittedly one of the minor contributing causes of war, shall be placed under the League's supervision.

These are only general principles. In themselves they would be of small value. But the Covenant, by Article 9, establishes a Permanent Commission to advise the Council in working them out in detail and securing their effective application. It may fairly be hoped that this machinery will in time enable the members of the League to give effect to the purpose of Article 8; and if so, great strides will undoubtedly be made towards the disarmament which everyone desires. In this respect, as in others, the authors of the Covenant were careful not to travel too fast; they laid foundations on which those who were to wield authority in the League could later build.

By providing in Article 18 for the publication of all treaties, the Covenant again goes beyond essentials. Yet no reasonable man can doubt that, under the diplomatic system which prevailed before 1914, secret treaties of alliance, directly by mere existence and indirectly through mistrust which they created, were one of the serious causes of international conflict.

Article 22 of the Covenant introduces a new principle into international affairs which is certainly extraneous to the central purpose of a league. The mandates system which it creates is a great experiment in the government by advanced peoples of backward territories and races. The main principles are simple. The Article is based on the proposition that backward peoples and territories are not for the future to be exploited for the exclusive benefit of those who govern them; that, on the contrary, their interests and well-being constitute a sacred trust of civilization, and that the way in which they are ruled is a matter of interest to the world at large. The Article therefore lays down that in the government of such territories the interests and progress of the inhabitants must be the guiding purpose of the administration. The methods by which their interests are to be protected and their development secured vary, of course, in every case with the nature of the territory and the character of the people concerned. But in every case the fundamental principles are the same; and to secure the observance of them the Covenant imposes on the mandatories a duty to make annual reports for submission to a permanent mandates commission; which is, in turn, to report to the Council. Here, again, the Covenant relies on publicity and public opinion as a guarantee that Article 22 will be faithfully carried into effect.

With regard to international coöperation, the Covenant in Articles 23 and 24 goes a great deal further than might be considered essential. It provides in general terms for the establishment of a labour organization (which in fact has been elaborated separately by another agreement); for the equitable treatment of commerce; for the development of freedom of transit; for League supervision of the traffic in arms; for League action in matters of public health; and for the general supervision by the League of all official, and also, if necessary or useful, of unofficial, international offices established for international purposes of general interest. There is no need to deal in detail with the provisions of these Articles. Their general effect is to make the League what it is clearly desirable that it should be—a central organism through which international activities of every sort can be coördinated and when useful assisted by the Council and the Secretariat. There can be no doubt that the result of this must be to prevent waste of effort and promote efficiency in the conduct of international business of every kind.

In the last place the Covenant, by Article 26, provides a method by which it can itself be amended; and this, it may be held, is not an essential of a league. It is true that the Covenant might have been regarded as an ordinary international treaty, valid, as most treaties are now made, for a certain fixed period, at the end of which it might have been renewed or changed by the ordinary methods. But it was precisely because the authors of the Covenant did not regard it as an ordinary international treaty that they provided a special means for amendment; and there can be no doubt that morally Article 26 is of great significance, and that practically it may prove to be of great constitutional value. It still leaves it difficult to secure amendment of the terms of the Covenant. It can only be done if all the members of the Council and the majority of the members of the Assembly are agreed. But the fact that amendment is definitely envisaged is in itself important, and the proceedings of the Amendments Commission established last year by the first Assembly, which will report for the acceptance of the next Assembly certain amendments of importance, have demonstrated the essential soundness of the conception of Article 26.

Generally, it may be said that when the Covenant goes beyond the essential features which are necessary to any effective league to preserve peace, it does so with one of two objects in view. Either it is with the purpose of giving real life to the machinery which it establishes: of bringing the international forces actually at work into effective coöperation, in order that members of the League may be brought closer together, and the League itself be strengthened and have the vitality that comes from continuous and varied work; or else it is with the purpose of removing those deep-seated causes which public opinion has recognized as having led to war. It is not by chance that the Covenant contains more or less elaborate provisions concerning armaments, the traffic in arms, annexation by conquest, the avoidance of unfair economic competition, imperial rivalry in the exploitation of backward countries, secret treaties and alliances. It is because these things have led to war in the past that the Covenant seeks to deal with them in a practical and effective way, to the end that war may be rendered less probable in the future.

It has already been said that the authors of the Covenant confined themselves to laying down the essentials of the organization which they considered the League required and the general rather than the detailed obligations to which they thought that members of the League must agree. Elasticity is one of the chief "notes" of the whole machinery of the League. The Council and the Assembly have been free to develop their own methods and systems as they chose, to appoint committees and commissions at their discretion, and to draw up codes of procedure which they could themselves change, and have thus been able to give to the general principles of the Covenant a free development on sound lines.

It is in pursuit of this same elasticity that in several cases the Council is charged to carry into execution plans which the authors of the Covenant felt to be essential, but which they were not themselves, for lack of time and for lack of expert technical advice, able immediately to develop. Much good has been done under these provisions.

It will perhaps be worth while to examine more in detail the working of the Covenant in action, and to examine it under three separate aspects: the first, the institutions of the League considered as political machinery; the second, the working of the Covenant in connexion with disputes; and the third, the activity of the League in the promotion of international coöperation.

*The League in Action.*—Of the two principal organs of the League, the Council was naturally the one which, up to the summer of 1921, had the best opportunity of proving in practice its working value. Meeting at Geneva, in the first 18 months of its existence, it held 13 sessions, many of which lasted a fortnight. Its members therefore had time to prove by experience whether or not the conception of the Council, as set forth in the Covenant, is right or not. There is probably no statesman who has sat as a member of the Council who would deny that it is an institution which has proved a success.

In its working there were, of course, great difficulties to be overcome. The first and most important of these was that of representation of the Governments entitled to seats on the Council. How was it to be—by ambassadors, by Cabinet ministers, by prime ministers? There is an evident difficulty in expecting a prime minister to give up so much time as the members of the Council had to give up during 1920–1 to their duties. There are no less solid objections to allowing the representation of members by ambassadors. Nevertheless, for far-distant countries—such as China and Japan—it is obvious that their coöperation can only be secured by representatives permanently residing in Europe, which, in practice, means their ambassadors; and of course the solution adopted by the European countries had varied. It is a matter which the Covenant leaves every country free to decide for itself. For the ordinary conduct of the affairs which come within the consideration of the League the solution acted on by Great Britain is probably the best one, namely that it should be represented by a Cabinet minister, whose duties are primarily to deal with all League of Nations business. He must act in close coöperation with the Foreign Office, even if he is not, as perhaps he should be, directly attached to it. When matters of first-class political or general importance are under discussion, it is eminently desirable that prime ministers or foreign ministers should themselves attend, and, if the League is to succeed, it will at great crises be essential that they should do so.

In a great deal of its work the Council required expert and technical study to enable it to take decisions, and to this end it adopted in a large number of cases a plan of appointing special temporary commissions to study the matter under discussion and to make a report. In practice this plan worked admirably. A striking example is the commission which prepared the project for the International Court of Justice. The Council appointed this commission, consisting of nine of the most eminent jurists in the world, and provided it with an expert secretariat. The Commission invited proposals, examined numerous schemes laid before them, prepared a detailed plan and submitted it, unanimously, for the consideration of the Council. The Council examined it, amended it in important particulars and presented it, in turn, to the Assembly. The Assembly again amended it, adopted it, and signed it in the form of an International Convention. It is a remarkable example of how the Council, by delegating technical work and by then taking the necessary political action on technical reports, can achieve results which, without the League, could not have been achieved.

The Council also adopted another method of delegating authority, namely, by the appointment of high commissioners. It appointed Dr. Nansen to act on its behalf in securing the repatriation of nearly half a million prisoners-of-war in Russia and Central Europe, who, 18 months after the Armistice, were still without prospect of being able to reach their homes. Dr. Nansen was able to coördinate the action of Governments, to obtain an international loan, to induce Governments and voluntary philanthropic societies to act harmoniously together, and, in general, to secure effective international coöperation in a sphere in which such coöperation could certainly have been achieved by no other means.

The Council also had to solve the problem of carrying on the detailed work and providing for the day-to-day decisions required by some of the administrative, or quasi-administrative, tasks which were entrusted to it. It solved this difficulty by entrusting its president with authority to take current decisions, in conjunction with the Secretary-General, and to exercise his own discretion as to when and how he must consult his colleagues by telegram or otherwise on any given matter. Thus, by means of a permanent secretariat, the difficulties of time and space are minimized.

On the whole it may be said that most of the very different tasks confided during its early existence to the Council were executed with a remarkable degree of unanimity and efficiency. The machine worked even better than it was expected to work and the advantages of continuous coöperation and discussion among the members were made increasingly plain.

The Assembly, considered as a political machine, was no less successful than the Council. Its first meeting was, indeed, a great event in the history of the world. No man could say beforehand what manner of thing it would prove to be. It might have been like previous international Conferences—remarkable for ill-prepared work, for formalism, and confused debate, or it might even have ended in disorder and sterility. Such was not the case. On the contrary, on the basis of the admirable preparatory work accomplished by the Council and the Secretariat, a very great amount of constructive work on the organization of the League and its subsidiary bodies was done. Some international agreements of the first importance were made. Compared with national parliaments the Assembly must be ranked very high, both for the order and interest of its debates—in spite of the difficulty of interpretation—and for the amount which it accomplished in the comparatively brief period of five weeks for which it sat. Most important of all, it created an international spirit, and an atmosphere of conciliation and coöperation, which were certainly unique in the history of international conferences, and augured well for the future of the League.

At the beginning of its labours the Assembly was bound to be faced by very difficult problems of its own internal organization. Obviously a great many items of its long agenda would have to be thrashed out in committee before they could be dealt with by the Assembly at large. It was also obvious that every country represented might wish to take part in any or all of these detailed preliminary discussions. That is to say, every country might wish to be represented on any, or all, of the Committees which the Assembly might set up. The following device was therefore adopted: the whole of the agenda was divided into six groups, and each of the groups was entrusted to a separate Commission. On each of these Commissions every member of the League had the right to one representative. Thus each delegate could serve on two of the Commissions (since each member can have three representatives), or could nominate a substitute to take his place. This system resulted in six Commissions which theoretically might each consist of 42 members, but at which, in practice, there was an attendance of from 25 to 40 members. These Commissions were not too large for the effective conduct of business; and yet they satisfied the legitimate desire of every country to be heard at all stages of every debate. In practice the Commissions studied the business put before them in great detail, and with great efficiency, and laid before the Assembly reports which, for the most part, were adopted as they stood. For some work it was of course necessary for the Commissions to appoint smaller Sub-Committees; but this in no way destroyed the control of every member over the detailed conduct of business.

For the general organization of the work of the Assembly, a central Committee or Bureau was appointed. This consisted of the President of the Assembly, the President of each of the six Commissions, and six other members elected by the Assembly at large. This body was responsible for settling the order of the agenda and for dealing with any current questions which arose. The system worked to the satisfaction of everyone. In its conduct of detailed practical business, no less than as a forum of international opinion, the Assembly fulfilled the best hopes that had been placed in it.

The Secretariat similarly proved in practice to be a sound working instrument. In many ways its task was more difficult even than that of the Council and of the Assembly. In accordance with the spirit of the Covenant, it was built up on lines as truly international as is consistent with the efficient conduct of its work. Over 20 nationalities were represented among its members, and yet the whole staff worked together harmoniously in pursuit of common ends. It was divided into sections, following the general division of the work which has been entrusted to the League. It is in no sense a rival to the Foreign Offices. It proved an efficient agency for the preparation of the work of the Council and of the Assembly, and for the execution of their decisions. Its work is greatly complicated by the fact that both French and English are official languages, and by the difficulties

of maintaining continuous contact with 48 different and distant States. Its work was none the less carried out in a spirit of devotion and with a degree of economy which earned the high approbation of a special Committee of Inquiry appointed by the Assembly.

The provisions of the Covenant with reference to disputes (Articles 11–17) had not yet been put into application sufficiently for a conclusive opinion to be formed on them. But there was sufficient experience of their working to make it fair to claim that they are based on sound principles.

The Articles relating to the legal settlement of disputes had hardly as yet been tested. The plan laid down in Article 14 for the creation of the Court worked well. It is worthy of special note that nine States had by the middle of 1921 already agreed to give the Court obligatory jurisdiction in all juridical disputes which might arise between them.

Apart from this, one legal question was solved in 1921 by the League, which would have been referred to the Court had it been in existence. This was the question of the competence of the League to deal with the Åland Is. dispute. Finland claimed that the islands lay entirely within its sovereignty, and that therefore the League could not deal with the matter. As there was no Court, the Council referred this contention to a Commission of three eminent international lawyers, a Frenchman, a Dutchman and a Swiss. This Commission made an elaborate report and produced so great a body of convincing legal argument in support of the League's competence that their decision was never for one moment questioned even by Finland, against whom it went. It was a good demonstration of the value of judicial methods; and it indicates the great authority which the International Court may be expected to wield.

The provisions of the Covenant for the settlement of disputes by political methods (Article 15) had more extensive trial. Three disputes of first-rate importance had been dealt with by the League by Aug. 1921—the Åland Is. dispute, between Finland and Sweden; the Vilna dispute, between Poland and Lithuania; and the Albanian frontier dispute, between Albania, Serbia and Greece. Of these the first in date and importance was that of the Åland Is. It was laid before the League in the month of June 1920, at a moment when there was great tension between the parties—tension which in the opinion of a good many competent judges was very likely to result in war. The Council's conduct of the matter afforded an illustration of the working of almost every provision in the Covenant that relates to the settlement of disputes. To begin with, the matter was brought to the League by the action of a third party—Great Britain—under the terms of Article 11; no better example could be wished for of the value of this Article. Next, the question of the legal competence of the League was referred by the Council, under Article 14, for an advisory opinion to a Commission of jurists representing the International Court. Next the Council appointed a political Commission of persons of high international authority, and of impeachable impartiality, to investigate the contentions of the parties and the merits of the dispute. This Commission spent several months on its inquiries, and passed a long time among the Aland Islanders themselves. As a result, they produced a remarkable report, against parts of which the Swedish Government strongly protested, but which nevertheless was recognised by public opinion as a fair and statesmanlike presentation of the facts and merits of the problem, and as a wide and practicable proposal for its solution. This report was published for the examination of the world at large as soon as it was laid before the Council. The matter was finally dealt with by the Council at its 13th session. The substance of the Commission's report was adopted as the Council's decision, and this in turn was accepted by all the parties. The Åland Islanders, whose representatives were themselves heard by the Council, secured guarantees from Finland amounting almost to autonomy, while the Swedish-speaking population of Finland secured protection, which, without the intervention of the League, they would not have done. Thus a very probable war was averted, and a path to friendly coöperation between close neighbours was opened. Such was the result of the full application of the new methods of delay, publicity and impartial investigation which the Covenant provides.

The history of the Council's conduct of the Vilna dispute between Poland and Lithuania is less satisfactory. The matter was rendered far more difficult from the start by the fact that, immediately it was referred to the League, the Polish forces of Gen. Zeligowski executed a *coup de force* and occupied the area in dispute. The Polish Government repudiated Gen. Zeligowski, but have since tacitly admitted their responsibility for his actions. There are provisions in the Covenant which might have been applied to induce Poland to remove Zeligowski's forces from the territory he had unlawfully invaded. These provisions were not applied. Moreover, had greater publicity been given to the conduct of the dispute by the Council in its early stages, the parties would have found it difficult to maintain their unreasonable, and on some points unjustifiable, course of action. But, in spite of these difficulties and mistakes, the Council nevertheless succeeded in preventing the outbreak of war. It even induced the parties to continue direct negotiations under the presidency of a distinguished member of the Council. It unanimously adopted recommendations at its 13th session, which, if the parties accepted them, seemed likely to lead to the settlement of the dispute by methods of peaceful negotiation and not by force of arms. Thus, even when the Council fails to avail itself of its full powers under the Covenant, it may still, as a result of the moral authority which it possesses, achieve very important results.

With regard to the promotion of international coöperation (Articles 8 and 9, 23, 24 and 25 of the Covenant) the League had done perhaps the most convincing and successful work of its early history. Reference may be made to the principal activities it engaged in. The first was the Brussels Financial Conference of 1920, which resulted in the formation of economic and financial Advisory Committees, and the preparation of a scheme for the financial and economic rehabilitation of Austria. The next was the Transit Conference, held at Barcelona in the spring of 1921, which drew up a number of conventions and recommendations on transit by sea, by river and by railway. The work of this Conference was prepared in the greatest detail by a League Committee, acting under the authority of the Council, and the results which it achieved, including the establishment of a Transit Committee, on which 14 different countries were represented, were of an encouraging kind. Another Conference, on the regulation of the white slave traffic, was held in June 1921, and was attended by a far greater number of States than any other similar Conference before, and achieved results of great importance which were shortly to be embodied in the form of a convention. With regard to the allied subject of opium, the Assembly appointed a Committee which has begun its work for the supervision of the traffic in drugs in a systematic way, on the basis of which a machinery of supervision and control will in due time be worked out.

In another order of ideas, the League acted as the coördinating centre of international action in various matters in which such action could not have been achieved except through the League and its Secretariat. As an example may be cited the repatriation of prisoners-of-war already referred to. Another was the campaign against typhus in central Europe, carried out by means of a central fund raised by members of the League and administered under the authority of an Epidemics Commission appointed by the Council. Such administrative international action is unique in the history of international relations, and there seems no reason why it should not be extended advantageously in the future.

There is one other matter which should be mentioned in connexion with this aspect of the League's work—the protection of racial and religious minorities. A great number of treaties have been signed in the last 70 years or so, in which provision has been made, and solemn obligations undertaken, for the protection of such minorities, particularly in central and south-eastern Europe. It is unfortunately true that these treaties have been

of very little worth. But by a series of new treaties, to which practically every State in central and south-eastern Europe has given its consent, the protection of these minorities is now placed under the authority of the League. When it is remembered how very mixed are the populations of the new States created by the Treaties of Peace, and how strong are the national feelings left by the war, it cannot be doubted that, if the League succeeds in securing the effective protection of minorities, it will do much to remove a very potent cause of trouble.

With regard to the League's work for disarmament, in addition to the Permanent Commission to which reference has already been made, the Assembly recommended to the Council that it should adopt again the plan to which it had had resort in connexion with the project for the Court of International Justice; and accordingly the Council appointed a Temporary Mixed Commission, consisting of military men, of politicians, of economists, of employers and of workmen, to study in more detail the application of Article 8, and to propose plans for the adoption of the Council and of the Assembly. This Commission had only just begun its work in the summer of 1921.

As a result, then, of the general review which has been given of the Covenant in action, it may fairly be held that in technical spheres the results which the League had achieved up to the middle of 1921 had been good. In political matters they had, whenever the Covenant had been acted upon, been no less good. But only too often the Governments of the members of the League and the members of the Council had failed to apply the provisions of the Covenant to matters of political importance with which it was intended that the League should deal. Until the members of the League use the methods of the Covenant for dealing with all international questions of first-rate political importance which arise, the League cannot have that full authority by means of which alone it will be able at times of crisis to prevent the outbreak of great world wars. If the members of the League do use the methods of the Covenant, experience justifies the belief that they will secure the effective settlement of their disputes, and that in doing so they will calm the passions and mitigate the hatreds which otherwise are calculated so gravely to menace the peace of the world.

*See* also the articles INTERNATIONAL LABOUR ORGANIZATION and MEDICINE, INTERNATIONAL. (R. C.)

**LEATHER** (*see* 16.330).—The decade 1910–20 saw considerable advances made in many of the processes incidental to leather manufacture. In addition to improvements in the older-fashioned methods of tanning, and the manufacture of leather generally, several new processes were perfected. The application of chemical control in the leather industry during this period made great headway. Whereas previously most leather manufacturers worked on empirical methods, it is now the general rule for all large leather works to employ the services of a chemist; and in consequence methods of leather manufacture have become more scientifically exact than was previously the case. Changes of procedure made necessary by the cutting-off of certain supplies during the World War period have ultimately had a beneficial influence on the industry. Alterations in the manufacturing process, thus rendered compulsory, have resulted in the perfecting of more economical working of various processes, and many of the methods used have consequently been retained with advantageous results.

*Tanning Materials.*—Additions to the earlier list of materials (*see* 16.332) are mimosa bark and mimosa extract. These tanning materials have attained a considerable degree of importance in the tanning of light and heavy leathers. Whereas mimosa was originally cultivated in Australia, it has latterly been introduced into S. Africa, which is now the principal source of supply. *Acacia pycnantha* (golden wattle) contains upwards of 40%–45% tannin. *Acacia decurrens* (green or black wattle) contains 36%–40% tannin. This latter variety is the one which is now most commonly cultivated in Natal and Cape Colony; its cultivation is also being carried out in northern Africa, Ceylon, and elsewhere. The manufacture of mimosa extract in S. Africa has become a commercial industry of considerable and increasing importance. This extract, which is exported from Natal in the solid form, contains from 60%–62% tannin matter. The product possesses excellent tanning properties, producing a leather of a slightly pinkish colour; it is a fermentable tannin which gives fair weight and rapid penetration, and is likely to compete with quebracho extract produced in Argentina.

*Synthetic Tannins.*—Great advances have been made in the manufacture of synthetic tannins. The original product of this important branch of tanning agents was "Neradol," prepared by the action of formaldehyde upon phenolic bodies, under suitable conditions. Since the introduction of this product, patented by E. Stiasny and manufactured by the Badische Anilin und Soda Fabrik in 1911, considerable progress has been made in the production of tanning agents of this character. Products of this class made by British firms are commercially obtainable under the names of "Synthetic tannin," "Syntan," "Cresyntan," "Paradol," "Maxyntan."

The leather produced by synthetic tannin is of a white colour and possesses light-weighing properties. Its principal use is in conjunction with natural tannins, either employing the material as a preliminary tannage prior to the application of the natural tannin, or using same in combination with the natural stuffs. Synthetic tannins differ from most natural tannin materials chiefly in the direction that they permeate the pelt with great rapidity and thereby accelerate the tanning process. These products are very useful for employment by curriers and leather dressers in the retanning of leather which has only been lightly or half tanned, *e.g.* E. India tanned kips, goat and sheep skins. The rapid penetration of the tannin above referred to enables the retanning to be done in a minimum of time. Whilst, in the early stages of its introduction, many difficulties were encountered in the method of application of these products, improved processes used in their manufacture have eliminated most of these, and the results are quite reliable, and synthetic tannins are now somewhat extensively used.

The introduction of synthetic tannins undoubtedly marks an epoch in the history of leather manufacture. Whilst the progress made up to the present is not sufficient to allow of their entire substitution for the natural products, it would appear probable that, aided by the great advances made in chemical technology, the day may not be so far distant when leather will be produced entirely by products of this kind.

*Sulphite Cellulose Extract.*—This product, sold under the names of "Wood Pulp Extract," "Spruce Extract," etc., results as a by-product from the manufacture of paper from wood pulp. The liquor resulting on the treatment of wood with calcium and sodium bisulphite in the manufacture of cellulose was, prior to about ten years ago, a waste product which had no industrial application. By a special method of treatment, with a view to ridding the product of objectionable impurities, *e.g.* calcium and iron salts, and subsequent concentration, an extract was prepared of 18°–25° Baumé, which has considerable application in the manufacture of leather. Whilst the product may not be regarded as a true tanning agent, it may be employed in conjunction with natural tannins. The material is most generally applied towards the latter end of the tanning process; and when retanning leather for the purpose of obtaining increased weight, the application is made when the tanning process is almost entirely complete. The fact that this is a by-product and can, consequently, be cheaply prepared, has caused it to be used to quite a considerable extent. The amount of matter absorbable by hide powder present in the commercial products varies from about 18% to as high in some cases as 25%.

*Analysis of Tanning Materials.*—The method of analysis most generally used is the hide-powder method, resulting upon the work of the International Association of Leather Trades' Chemists and the Society of Leather Trades' Chemists. This method for the estimation of tannin, whilst still being somewhat empirical, enables the obtainment of concordant results, and furnishes a figure which bears some relationship to that obtainable in practical tanning.

The following is the method of carrying out the analysis which is officially recognized by the Society of Leather Trades' Chemists:—Such a quantity of material shall be employed as to give a solution containing as nearly as possible four grams of tanning matter per litre, and not less than 3·5 or more than 4·5 grams. Liquid extracts shall be weighed in a basin or beaker and washed with boiling distilled water into a litre flask, filled up to the mark with boiling water, and well mixed and rapidly cooled to a temperature of 17·5° C., after which it shall be accurately made up to the mark, again well mixed, and filtration at once proceeded with. Sumach and myrabolam extracts should be dissolved at a lower temperature. Solid extracts shall be dissolved by stirring in a beaker with successive quantities of boiling water, the dissolved portions being poured into a litre flask, and the undissolved being allowed to settle and treated with further portions of boiling water. After the whole of the soluble matter is dissolved, the solution is treated similarly to that of a liquid extract. Solid tanning materials, previously ground till they will pass through a sieve of five wires per centimetre, are extracted in Koch's or Procter's extractor with 500 c.c. of water at a temperature not exceeding 50° C., and the extraction continued with boiling water till the filtrate amounts to one litre. It is desirable to allow the material to soak for some hours before commencing the percolation, which should occupy not less than three hours, so as to extract the maximum of tannin. Any remaining solubles in the material must be neglected, or reported separately as "difficultly soluble" substances. The volume of liquor in the flask must, after cooling, be accurately made up to one litre.

*Filtration.*—The infusion must be filtered until optically clear. No correction for absorption is needed for the Berkefeld candle, or for S. and S.-590 paper if a sufficient quantity (250–300 c.c.) is rejected before measuring the quantity for evaporation, and the solution may be passed through repeatedly to obtain a clear filtrate. If other methods of filtration are employed the average correction necessary must be determined in the following manner:—About 500 c.c. of the same or a similar tanning solution is filtered perfectly clear, and, after thorough mixing, 50 c.c. is evaporated to determine "total soluble No. 1." A further portion is now filtered in the exact method for which the correction is required (time of contact and volume rejected being kept as constant as possible) and 50 c.c. is evaporated to determine "total soluble No. 2." The difference between No. 1 and No. 2 is the correction sought, which must be added to the weight of the total solubles found in analysis.

An alternative method of determining correction, which is equally accurate and often more convenient, is to filter a portion of the tanning solution through the Berkefeld candle till optically clear, which can generally be accomplished by rejecting 300 or 400 c.c. and returning the remaining filtrate repeatedly; and at the same time to evaporate 50 c.c. of the clear filtrate, obtained by the method for which correction is required, when the difference between the residues will be the correction sought. (It is obvious that an average correction must be obtained from at least five determinations.) It will be found that this is approximately constant for all materials, and amounts in the case of S. and S.-605, 150 c.c. being rejected, to about 5 mgm. per 50 c.c., and where 2 grams of kaolin are employed in addition, to 7½ mgm. The kaolin must be previously washed with 75 c.c. of the same liquor, which is allowed to stand fifteen minutes and then poured off. Paper 605 has a special absorption for the yellow colouring matter in sulphited extracts.

Hide powder must be of a woolly texture, thoroughly delimed, preferably with hydrochloric acid, and must not require more than 5 c.c. or less than 2·5 c.c. of decinormal NaOH or KOH to produce a permanent pink colour with phenolphthalein on 6½ grams of the dry powder suspended in water. If the acidity does not fall within these limits it must be corrected by soaking the powder before chroming for 20 minutes in 10 to 12 times its weight of water, to which the requisite calculated quantity of standard alkali or acid has been added. The hide powder must not swell in chroming to such an extent as to render difficult the necessary squeezing to 70–75% of water, and must be sufficiently free from soluble organic matter to render it possible in the ordinary washing to reduce the total solubles in a blank experiment with distilled water below 5 mgm. per 100 c.c. The powder when sent out from the maker must not contain more than 14% of moisture, and must be sent out in air-tight tins.

The detannization must be carried out in the following manner:—The moisture in the air-dried powder is determined, and the quantity equal to 6·5 grams actual dry hide powder is calculated, which will be practically constant if the powder be kept in an airtight vessel. Any multiple of this quantity is taken according to the number of analyses to be made, and wet back with approximately 10 times its weight of distilled water. Very woolly powders require slightly more than 10 times their weight of water; a powder may be considered "woolly" if it cannot be poured like sand from a beaker. Two grams per 100 of dry powder of crystallized chromic chloride, $CrCl_3 6H_2O$, is now dissolved in water and made basic with 0·6 gram of $Na_2CO_3$ by the gradual addition of 11·25 c.c. of normal $Na_2CO_3$, thus making the salt correspond to the formula $Cr_2Cl_3(OH)_3$. This solution is added to the powder, and the whole churned slowly for one hour. In laboratories where analyses are continually being made, it is more convenient to employ a 10% stock solution, made by dissolving 100 grams of $CrCl_3 6H_2O$ in a little distilled water in a litre flask and very slowly adding a solution containing 50 grams of anhydrous sodium carbonate, with constant stirring, finally making up to the mark with distilled water and well mixing. Of this solution 20 c.c. per 100 grams or 1·3 per 6·5 grams of dry powder should be used.

At the end of one hour the powder is squeezed in linen to free it as far as possible from the residual liquor, and washed and squeezed repeatedly with distilled water, until, on addition to 50 c.c. of the filtrate of one drop of 10% $K_2CrO_4$, and four drops of decinormal silver nitrate, a brick-red colour appears. Four or five squeezings are usually sufficient. Such a filtrate cannot contain more than 0.001 gram of NaCl in 50 c.c.

The powder is then squeezed to contain 70–75% of water, and the whole weighed. The quantity Q containing 6·5 grams dry hide is thus found, weighed out, and added immediately to 100 c.c. of the unfiltered tannin infusion along with (26·5 − Q) of distilled water. The whole is corked up and agitated for 15 minutes in a rotating bottle at not less than 60 revolutions per minute. It is then squeezed immediately through linen, one gram of kaolin added to the filtrate, stirred and filtered through a folded filter of sufficient size to hold the entire filtrate, returning until clear, and 50 c.c. of the filtrate is evaporated and reckoned as 50 c.c., or the residue of 50 c.c. is multiplied by six-fifths. The non-tannin filtrate must give no turbidity with a drop of 1% gelatine, 10% salt solution. The kaolin may be used by mixing it, with the hide powder in the shaking bottle. The analysis of used liquors and spent tans must be made by the same methods employed for fresh tanning materials. The liquors or infusions, being diluted, are concentrated by boiling *in vacuo*, or in a vessel so closed as to restrict access of air, until the tanning matter is, if possible, between 3·5 and 4·5 grams per litre, but in no case beyond a concentration of 10 grams per litre of total solids, and the weight of hide powder must not vary from 6·5 grams.

The results must be reported as shown by the direct estimation, but it is desirable that, in addition, efforts should be made, by determination of acids in the original solution and in the non-tannin residues, to ascertain the amount of lactic and other non-volatile acids absorbed by the hide powder and hence returned as "tanning matters." In the case of used tans it must be clearly stated in the report whether the calculation is on the sample with moisture as received, or upon some arbitrarily assumed percentage of water; and in that of used liquors whether the percentage given refers to weight or to grams per 100 c.c., and in both cases the specific gravity shall be reported.

*Processes Preparatory to Tanning.*—Considerable advances have been made in the methods of preparation of the hides and skins for tanning, particularly in the liming process. The beneficial influence of the addition of sodium sulphide to lime in the depilation of skins and hides, in the direction of accelerating the process and effecting the desired result as regards loosening of the hair and epidermis, has long been well known. During recent years the employment of gradually increasing strengths of this addition to the liming process has been more largely practised, with the result that the time required for the depilation of various goods has been materially shortened. Particularly in the manufacture of calf, sheep and goat skins into chrome tanned leather, the use of this depilatory has assumed great importance. Dependent upon the characteristics required in the resulting leather, the percentage of sodium sulphide employed varies between 1% and 5% of the soaked weight of skins. When dealing with somewhat common sun-dried or dry-salted skins, it is now general practice to use a very strong solution, with a view to reducing the time of the liming process to two or three days, whereas previously two or three weeks was not considered unduly prolonged.

Improvements have been made in the carrying-out of the liming process in the direction of applying mechanical labour-saving devices.

In order to obtain greater uniformity than is the case in the finished leather resulting from the older-fashioned method of laying the goods in a saturated solution of lime in a pit for varying periods, several manufacturers have, with a view to saving time and labour, installed special mechanical apparatus for the purpose of agitating the lime liquor. In the case of heavy goods, *e.g.* hides, the goods are either suspended in the lime-pit and the liquor agitated by means of a screw propeller or small paddle-wheel working in the bottom of the pit; or the hides are suspended from a wooden or steel framework placed slightly below the surface of the liquor in the pit, and the necessary movement imparted by rocking the frame by mechanical power. A further method installed in several large works consists in keeping the lime liquors in a state of agitation by blowing compressed air into the bottom of the pit, thereby causing the liquor to be continually in a state of motion during the period of immersion of the goods.

With a view to minimizing the labour involved in handling hides or skins when liming by the pit method, liming in cages is now practised. In this method the goods are placed in a large wooden cage contained in the ordinary lime-pit; the cage and its contents can be bodily removed by means of a travelling crane working overhead. The goods are placed in the cage on one of the pits and are then transferred, as and when required, from one lime solution to another by attaching same to the travelling crane, withdrawing the cage containing the pack of hides and skins. The removal of the goods through the whole of the series of pits, and the transference of the pack to the unhairing and fleshing machines without the employment of any hand-labour for handling the goods, may thus be accomplished by this means.

In the liming of light skins, sheep and goats, for example, the liming process has been considerably accelerated by liming in paddle-wheels instead of in pits; the goods being paddled several times daily during the period of their immersion, thus eliminating the labour involved in the older-fashioned method of withdrawing each individual skin by hand from the pit and then replacing for the purpose of altering the position in the solution.

*Puering and Baiting.*—Great improvements have been made in the operations of puering and baiting by substituting solutions containing pancreatic enzymes for the ordinary bird-excrement and dog-manure infusion used for depleting skins after the liming process. Enzymes of pancreas absorbed in wood sawdust, or vegetable meal, mixed with varying proportions of ammonium chloride or boracic

acid, are now almost entirely used in substitution for the older-fashioned disgusting process. These substitutes have resulted on the researches of J. T. Wood; and it has been recently shown by A. Seymour-Jones and J. T. Wilson that the depleting action of pancreatic enzymes is due to their solvent action upon elastins. The addition of ammonium chloride or boracic acid is for the purpose of effecting the removal of the lime; the enzymes by their liquefaction of the elastins bring about that degree of flaccidity required on most light leathers before tanning.

*Currying.*—The older-fashioned process of impregnating leather with grease by the application of a dubbin consisting of a mixture of tallow and cod oil, when manufacturing the so-called "waxed" leathers for boot upper leather, has now almost become a thing of the past. Chrome tanned "box" and "willow" calf leather have almost entirely supplanted the old-fashioned greasy leather for use in the manufacture of boot uppers for general wear. For leather intended for army boots and boots for agricultural and similar purposes, the method of grease impregnation by drum-stuffing is the one universally practised. In the manufacture of belting leathers, and leather for hydraulic purposes, hose pipes, leather buckets, etc., the method of impregnating by dipping the leather in melted greases is very commonly practised. This is carried out by placing the previously thoroughly dried leather in a suitable vat, which can be heated by means of a steam coil to any desired temperature, and which contains a mixture of melted paraffin wax, and hard tallow or wool stearine, etc.; the leather being immersed for a few moments until complete permeation has been effected, when it is withdrawn and then scoured for the purpose of removing grease from the grain and flesh surfaces.

*Sulphonated Oils.*—Sulphonated oils, the original of which was the so-called Turkey Red Oil, made by treating castor oil with sulphuric acid, have now been generally adopted in the fatliquoring and dressing of leather of all kinds. On account of the fact that these oils are acidic in character and are not adversely affected by acid solution, their employment has been considerably extended in respect of their application in the nourishing and fatliquoring of dyed leather. Properly prepared sulphonated oils have no adverse influence on leather which has been dyed with acid colours, with the consequence that they greatly facilitate the manufacture of dyed leathers and enable the fatliquoring operation to be done in the same solution as the dyeing has been performed, if this method of application is to be desired on the grounds of economy.

Sulphonated oils specially prepared for the leather industry consist of sulphonated wool olein, sulphonated castor oil, sulphonated neatsfoot oil, and sulphonated mineral oils. All these have been used for this purpose in addition to being used for oiling leather in the tanned condition prior to drying, in substitution for cod oil, mineral oil, etc., which were almost universally used previously for this purpose; the emulsion which results on dilution of these oils with water is useful in the direction of producing a lighter-coloured leather than is the case when the older-fashioned process is employed.

*Glove-Leather Dressing.*—The alum, salt, flour and egg process ordinarily practised in the manufacture of sheep and lamb skins for the lighter grades of glove leather has been either partially or entirely substituted by many manufacturers, who have adopted the chrome tanning process. For the heavier grade of glove leather required for men's wear, chrome leather would appear to possess many advantages over the ordinary alum and salt process; the leather being softer, more tensilely strong, and stouter in substance than that produced by the alum and salt method, in addition to being waterproof and enabling the gloves to be washed after wear, which is not practicable with alum leather, the tannage of which is readily removable by washing, causing the gloves to lose softness on drying.

The dyeing of glove leather is now more extensively carried out by the aid of coal-tar colours in substitution, either entirely or partially, for the wood and natural dye-stuffs previously used.

*Suede Leather.*—Suede leathers finished with a velvet-like surface or "nap" are now largely employed in the manufacture of gloves, fancy leather articles, trimmings for clothing, ladies' hats, shoes and handbags, etc. These goods are invariably finished on the flesh side, and the larger proportion of these leathers are made from E. India tanned ("Persian") sheep.

These goods, after the usual preparation and retanning with sumach, are dried, nailed, strained out on boards, and then buffed on the flesh side to obtain the desired fineness of "nap." After buffing, they are wetted down and dyed, and afterwards fatliquored with sulphonated oil, being finally dried, and finished either on the buffing-wheel or by "scurfing" with an emery-covered scurfer.

*Suede gloves leathers* are tanned by the alum, salt, flour and egg process, or by the chrome tanning process, and are then fluffed on the flesh side, buffing several times on a fine emery or carborundum wheel, being afterwards re-dyed with a mixture of natural dye-stuffs and "topped" with a suitable coal-tar colour; the finishing operations consisting of staking and re-wheeling.

Calfskins with a suede finish are generally finished on the grain side, the goods previous to dyeing being buffed on a rapidly rotating carborundum buffing wheel, after setting and drying; the goods being re-buffed lightly on the required "nap" raised by rubbing over with an emery-covered block after dyeing and drying.

*Aldehyde Leather.*—Sheep fleshes tanned by the aldehyde process and finished white are now largely used in the manufacture of washable gloves. This tannage effected by means of formaldehyde, originally invented by Payne and Pullman in 1898, has come into considerably extended use in this branch of the leather industry.

The goods, after liming, are frizzed and then delimed and leathered in the drum with a weak solution of formaldehyde rendered slightly alkaline by the addition of washing soda or soda ash, to which French chalk or other white filling agent is sometimes added. The goods, after leathering, are dried, staked and wheeled on both sides, and finally calendered to produce the fine nap-like surface.

*Chrome Tanning.*—The rapidity with which this method of tanning converts pelt into leather, combined with the strength, appearance, and wearing properties of the finished leather, has caused this method to be almost universally adopted in the manufacture of boot upper leather; glacé kid (*i.e.* chrome tanned goatskins), "box," "willow" calf, and side leather.

Considerable improvements have been made in the manufacture of chrome tanned leather. These improvements consist chiefly in modifying the original processes invented by Schultz and Martin Dennis; the former inventing the "double-bath" process which is employed almost exclusively in the manufacture of glacé kid, and the latter the "single-bath" process which is used on calf and side leather. The more accurate adjustment of quantities combined with a chemical control of the tanning process and greater skill in the finishing processes are chiefly responsible for the improved manufacture, rather than any material alteration in the general process.

**LECOCQ, ALEXANDRE CHARLES** (1832–1918), French musical composer (*see* 16.355), died in Paris Oct. 24 1918.

**LEE, SIR SIDNEY** (1859– ), English man of letters (*see* 16.363), was knighted in 1911. His lectures on *The French Renaissance in England* and *Great Englishmen of the 16th Century* were published in 1910; and his later works include *Principles of Biography* (1911) and *Shakespeare and the Italian Renaissance* (1915). He became president of the English Association in 1917 and dean of Arts in the university of London in 1918.

**LEE, VERNON,** the pen-name of Violet Paget (1856– ), English author, was born in France of English parentage Oct. 14 1856, and made her home at Maiano, near Florence, identifying herself with her adopted country and making special study of its art and history. Amongst her publications are *Studies of the Eighteenth Century in Italy* (1880) and many volumes of essays; certain novels and stories, such as *Miss Brown* (1884); *A Phantom Lover* (1886); *Hauntings* (1890); *Vanitas* (1892); *Sister Benvenuta* (1906) and *Louis Norbert* (1914); a play in verse, *Ariadne in Mantua* (1903), and *Satan the Waster*, a philosophic trilogy (1920), as well as a volume of political essays, *Gospels of Anarchy* (1908).

Her half-brother, EUGENE LEE-HAMILTON (1845–1907), who was also born in France Jan. 6 1845, was educated in France and Germany and at Oriel College, Oxford, afterwards entering the diplomatic service. He married in 1898 Annie E. Holdsworth, author of *Joanna Traill, Spinster; The Years that the Locust Hath Eaten*, and other novels. He published a number of volumes of poetry, as well as a translation of Dante's *Inferno*, and (with his wife) *Forest Notes* (1899). He died at Florence Sept. 7 1907.

**LEGROS, ALPHONSE** (1837–1911), Anglo-French artist (*see* 16.380), died in London Dec. 8 1911.

**LEHMANN, LIZA** (1862–1918), English singer and composer, was born in London July 11 1862, the daughter of the artist Rudolf Lehmann. She studied singing under Alberto Randegger and Hamish MacCunn, making her début in 1885, and became extremely popular as a concert singer. In 1894 she married Herbert Bedford, the composer, and retired from the concert platform, devoting herself henceforward chiefly to composition. Her most popular works are the song cycles *In a Persian Garden* (1896, words from the Rubaiyat of Omar Khayyam) and *The Daisy Chain* (1900), and various Shakespearean songs, while she also produced a light opera, *The Vicar of Wakefield* (1907); the music

for the farce *Sergeant Brue* (1904) and the morality play *Everyman* (1915). Madame Lehmann became well known as a teacher of singing. She died at Hatch End, Pinner, Sept. 19 1918.

**LELAND STANFORD JR. UNIVERSITY** (*see* 16.406).—The work of the university was so reorganized during the decade 1910–20 that the first two years constituted a so-called lower division with certain specified requirements, including biology, a course in citizenship, etc. The major department system became operative at the beginning of the junior year, and degrees were granted upon the recommendation of the departments. The institution sold some of its large ranch property in 1919, and in 1921 had about $25,000,000 in investment securities and an educational plant that included the Stanford Medical School, Lane and Stanford hospitals, Stanford school for nurses, the Lane medical library, all in San Francisco, and the Hopkins marine station on Monterey Bay, the whole valued at $10,000,000. The medical school owed its origin to the fact that the directors of the Cooper Medical College in 1910 turned over that institution and the associate Lane hospital to Stanford. In addition to the schools of law, medicine and education, a graduate school was organized with a dean at its head in 1917. New dormitories for women were constructed and a housing scheme inaugurated whereby practically all the faculty and students will eventually live on the college campus. Volumes in the library numbered 319,872 in 1920, of which 48,187 are in the Lane medical library and 23,360 in the law library.

In 1920–1 the students numbered 2,489, of whom 500 were women and 281 graduates, a gain of 43% over the 1907–8 figures, which were 1,738, of whom 500 were women and 126 graduates. Limitation in the size of the endowments and of the facilities of the plant caused a restriction in the student body to something over 2,000. Only 500 men with less than a year and a half of college standing are admitted each year, but there are no limitations for upper-class students. The tuition fee in 1920 was $40 per quarter, but after Oct. 1 1921 it was to be $75.00. There was in operation a tuition note system by which worthy students might delay payment of tuition until three or more years after graduation. Although in 1921 military training was not required, there was a field artillery unit of the Reserve Officers' Training Corps.

During the World War Stanford was represented by about 3,000 of its members, graduates and undergraduates, of whom 70 lost their lives. A Students' Army Training Corps unit, comprising practically all the men students, was organized during the war period.

Dr. John Casper Brauner, a distinguished geologist, was president from 1913 to 1915. Dr. Ray Lyman Wilbur became president Jan. 1 1916. (R. L. W.)

**LEMAÎTRE, FRANÇOIS ÉLIE JULES** (1853–1915), French critic and dramatist (*see* 16.408), died in Paris Jan. 21 1915.

**LEMAN, GÉRARD JOSEPH MATHIEU GEORGES** (1851–1920), Belgian general, was born at Liége Jan. 8 1851, the son of an artillery captain who was a professor at the École Militaire. He entered the École Militaire at Brussels, and when he left it in 1869 had acquired a reputation for brilliance. During the Franco-German War he served in a Belgian observation corps. In 1882 he became a member of the teaching staff of the École Militaire, and both then and later, as head of the school, he exerted considerable influence on military matters. In Jan. 1914 he was appointed commander of the fortress of Liége and also of the 3rd Div., and concentrated all his efforts upon strengthening the defences of the town against a possible German attack. This came in Aug. 1914, when Gen. von Emmich's army appeared before Liége and summoned it to surrender. On Gen. Leman's refusal the fortress was attacked and ultimately destroyed, while its heroic defender was captured and imprisoned in Germany. As a token of respect, however, he was allowed to retain his sword. He returned to Belgium after the Armistice, and died at Brussels Oct. 17 1920.

**LEMBERG (LVOV), BATTLES ROUND, 1914–5.**—In the Austro-German campaign against Russia, the operations round Lemberg (Polish, Lvov) both in 1914 and in 1915 formed an important part of the fighting in Galicia. They are described here in two general sections.

I. THE GALICIAN BATTLE OF AUG.–SEPT. 1914

In accordance with the general tactical and strategical situation, the main body of the Austro-Hungarian army concentrated and formed up for deployment in Central and Eastern Galicia, about Aug. 20 1914. The four armies (I., II., III., IV.) formed up for deployment under cover of a frontier guard for which provision had been made in peace-time. This was augmented by other troops as follows: (*a*) those corps which had been stationed in the deployment area (I. Cracow, X. Przemysl, XI. Lemberg), parts of which had even in peace-time been pushed forward to the frontier; (*b*) the cavalry divisions quartered in the above-named areas, which had been hastily reinforced from the interior of the monarchy; (*c*) the Territorial Landsturm, Gendarmerie and Customs guards, which had been called up on the first day of the alarm to occupy all the important frontier posts. These precautions were taken on the definite assumption that the Russians would employ their powerful cavalry masses in a rapid incursion for the purpose of hindering the mobilization and deployment of the Austro-Hungarian armies, an assumption which subsequent events almost completely belied.

Although all components of the army formed up for deployment according to programme, the advantage to be gained by greater speed in their mobilization, on which the Army Commands of the Central Powers had always counted, was not achieved. The fact was that, though incomparably better situated as regards mobilization and deployment, the Central Powers suffered from mistaken political and military-political calculations, which delayed effective war preparation by nearly a month, and also from the fundamentally unsound grouping of the armies. The main portion of the II. Army (IV. and VII. Corps) was first deployed against Serbia on the Sava, where portions of it were even engaged, with the result that this army—having to traverse the whole breadth of the monarchy to the N.—was only represented by one-third of its strength (the Kövess army group, XII. Corps) in the great introductory battles. After the arrival of all forces allocated to the N. the total strength of the armies was, roughly, 750,000 rifles, 60,000 sabres and 2,000 guns.

The first-line infantry was well armed and equipped, though the rifle was ballistically somewhat inferior to the Russian service pattern. The cavalry was well mounted, but undeniably old-fashioned in its equipment. The artillery was relatively inferior to the Russian in the quantity, and absolutely in the quality of its guns. In view of the medley of races within the Austro-Hungarian Monarchy, and the violent constitutional struggles arising from the centrifugal nationalist agitation fanned from outside, doubts had arisen in many quarters as to the trustworthiness of the troops. As regards the first period of the war these doubts were certainly not justified. The spirit of the army resisted all attempts to undermine it, and the bearing of the troops in the initial battles was excellent, superior indeed to that of the enemy on more than one front.

*Strategic Aims.*—On the Russian side the forces used in the opening operations and the preliminary battles were as follows:—(*a*) against East Prussia—the I. and II. Armies with over 20 infantry divisions; (*b*) against Austria-Hungary—the IV., V., III. and VIII. Armies in the first line, the VII. Army in the second. These armies had each a strength of 9–12 infantry and 3–4 cavalry (or Cossack) divisions. Judged by the number of units, therefore, Russia's superiority in numbers did not appear to be overwhelming, but it was actually greater than appeared, since the Russian infantry division was about one-fifth stronger in infantry and artillery than the Austro-Hungarian. About one-quarter of the Russian forces consisted of reserve divisions.

The information received by the Austro-Hungarian Higher Command, before and during deployment, gave a far from clear idea of the operative situation. They knew that the transport of troops for deployment was going forward on all railway lines and were aware of the evacuation of Congress Poland; but as regards grouping and strength, particularly in the case of the heavy-massed groups rolling up from the E., they appear to have been in uncertainty. It is possible that they underestimated these. For the Austro-Hungarian conduct of operations two alternatives presented themselves: (1) to unite the whole of the fighting forces on the Middle and Lower San and accept a defensive battle, advantage at the same time being taken of any

opportunity for a well-timed offensive, using as a pivot for this the San and Vistula line (by that time completely prepared), the fortress of Przemysl, and the San and Vistula bridgeheads, designed for the purpose; (2) to open an immediate offensive against the Russian army masses, as yet divided, while they were making their concentric advance.

The advantage of the first plan lay in the possibility of utilizing the whole of the forces to the last rifle and gun, and also of inflicting partial tactical defeats on the enemy by swift and skilful advances from the bridgeheads. Against this weighed the disadvantage of allowing the Russians to bring up the whole of their superior forces. East Galicia, too, with Lemberg, its political and economic centre, as well as large portions of Central Galicia, would be relinquished without a struggle to the enemy, who could also make use of his increasing numerical superiority to invade Hungary—with momentous political results.

The advantage of the second plan lay in the reasonable hope of falling on the still divided enemy armies with relatively superior forces. But here the danger was that, as the army would at first have to advance fan-wise owing to its obligatory initial situation, a mishap in any one of the armies might—owing to the relatively small extent of the area available for manœuvring—compromise the whole situation and even bring all the armies into a critical position. Thus the second alternative was by far the more risky solution, depending as it did on skill in the leading of the various armies. Provided, however, that no important errors of detail were made, it promised the greater results; and it was the alternative chosen by the Army Higher Command.

For the Russians the natural procedure, aimed at from the very first, was to make a concentric attack on the Dual Monarchy simultaneously with a threat to East Prussia, and one to Berlin in the background. The enormous fighting masses of the Russian Empire, and the relative shortness of the lines, admitted of this double project. Thanks to the early completion of their preparation they were also enabled to make full use of their original enveloping base against Austrian territory and the armies forming up for deployment within it. All the main lines of transport converged thither, while the whole conduct of operations was materially advanced by the circumstance that the strategical and even the tactical communications between the two great concentration areas—the territory between the Vistula and the Bug on the one side and Podolia on the other—were completely guaranteed by the triangle of fortresses—Kovno, Dubno and Luck (Lutsk). The Russian plan of operations was accordingly drawn up on these lines. In the area between the Vistula and the Bug were posted the V. Army (Chelm) and the IV. Army (Lublin) facing generally southward; and against East Galicia the III. and VIII. Armies facing generally westward, while the VII. Army followed in échelon to the left.

*Preliminary Operations.*—Some characterization of the fighting methods on both sides, as evidenced in the beginning of the war, may not be out of place here.

In all Austro-Hungarian tactical regulations and training manuals the greatest stress was laid on the encounter battle. Conscious and deliberate initiative was represented as the leading motive of every sort of action in war or battle. In practice, particularly in the grand manœuvres, this motive, correct as it was, came to be so exaggerated that the attack was practically asserted to be the one true form of battle. This undoubtedly created a certain rigidity of opinion which in the long run developed into schematism. To fail to attack was to run great risk of adverse criticism and judgment, a decisive personal motive being thus added. Another result was a frequently very marked belittling of the effect of weapons, which was particularly the case with the artillery. Rigorous battle-training and profitable employment of this arm were consequently taken too little into account; and its tactical coöperation was developed rather on the formal side. With the cavalry analogous principles were laid down. Dismounted fire action above all was a method of fighting rarely and unwillingly practised. The infantry was very well trained on modern principles, particularly in the technique of rifle fire; but the tactical coöperation of the three arms received no special attention. Taking all in all it was reasonable to count upon a quick engagement by all detachments and groups, particularly as the fighting *moral*—especially at the beginning of the war—was at its highest level, and the flexibility of units and the uniform training of commanders of all grades seemed to guarantee high manœuvring power.

For the Russian army the war with Japan had been an excellent training. The coöperation of all arms, and particularly the employment of their strong artillery, had reached a high stage of development. Especially remarkable was their rapid fortifying of the field of battle by means of which a Russian front habitually covered itself almost as soon as an action began. In this respect the Russians were at first far superior to their opponents. Indirectly this no doubt contributed to the clumsiness of most of the attacks, which often resulted, contrary to the wish of the Command, in a stationary fire-fight in which the superiority of the Russian artillery was usually balanced by that of the Austro-Hungarian musketry training. In manœuvring the Russians were less skilful than their opponents, who profited by this fact to extricate themselves from many an awkward tactical situation. The Russians were capable of great marching feats on occasion, but their pace was generally rather slow. Their fighting *moral* was excellent throughout; indeed their endurance in the most difficult tactical situations could not be surpassed. The reconnoitring activities of the Russian cavalry, particularly of the Cossacks, was remarkable, and not less remarkable was the use made of political propaganda, systematically introduced in peace, and the good organization of intelligence in the potential theatre of operations. On the other hand, the Russian cavalry was disinclined to mounted action on a large scale and had a marked preference for the dismounted fire-fight. No considerable mounted attack therefore ever occurred, though on several occasions large masses of cavalry were opposed to each other.

On Aug. 15 the Austro-Hungarians pushed forward all the cavalry divisions in the deployment area to gain touch with the enemy. It was hoped that this, combined with a general air reconnaissance the day before, would give the necessary data for decisive conclusions. But the reconnoitring activity of the cavalry resulted only in a series of small cavalry actions, successful and unsuccessful, without bringing in trustworthy information as to the grouping of the enemy, whose fighting strength and readiness for operations were, speaking generally, underestimated in consequence. Nevertheless Aug. 18 saw the issue of orders which formed the basis of the offensive scheme in all armies. This inevitably involved—even merely geometrically—the armies drawing apart excentrically. The Army Higher Command, however, reserved to itself the definitive grouping of the larger units. This was particularly the case with the IV. Army, in the centre, whose orders were "to group itself in such a way as to be able to push forward towards the N., N.E. or E."

On the three following days (Aug. 20, 21 and 22) the I. Army successfully accomplished the crossing of the Tanew region, dreaded for its impracticability, without mishap, and took possession through its advanced guards of the pronounced ridge lying north of this region from E. to W. For the rest, the I. Army was required to occupy the whole of the ridge on Aug. 22, the IV. Army, as before, to hold itself in readiness to proceed to the N. or N.E., while the III. and II. Armies (or rather that group of the latter, under Gen. von Kövess, which had arrived in the theatre of war), with fronts facing E., were to deal with any possible attacks.

Out of this situation there arose a string of combats which at first were favourable to Austria-Hungary. Thus at Czernowitz a Russian division was repulsed by an Austrian Landwehr division and thus also arose S. of Krasnik from the 23rd onwards a series of actions which are collectively known as "the battle of Krasnik." The I. Army went forward, with its nine divisions in columns aligned, and came upon the enemy in a prepared position but numerically greatly inferior. At first, indeed, there were only two and a half infantry divisions, hurriedly thrown forward from the Lublin concentration area, and though reinforcements were sent up to them they remained considerably inferior in

numbers. Fighting with extraordinary bravery they were nevertheless ousted from all their positions by the morning of Aug. 25, the I. Army attempting to envelop the Russian right wing. In their hasty retreat the Russians left behind them 6,000 prisoners, 28 guns and a number of standards.

Under the influence of these events the Austro-Hungarian Army Higher Command, on the evening of Aug. 24, issued the definitive dispositions for developing its offensive. In accordance with this the I. and IV. Armies were to deliver the proposed great blow northward, *i.e.* against the IV. and V. Russian Armies, the general direction given being "Lublin and Chelm." The III. Army and the available portions of the II. Army were to be entrusted with the defence against the Russian III. and VIII. Armies advancing from the E., which mission—it must be emphasized—they were to carry out offensively. Thus on the Austro-Hungarian side a mass of 350 first-line battalions was allotted to the main blow northward while 150 battalions (which could soon be reënforced up to 200) were to act on the defensive towards the east.

The first great scheme in the operations, which aimed at a rapid advance and an attack on the enemy's oncoming main groups before they could unite, might therefore be considered a success—at least as regards the first part. In view of the difficulties surmounted this was certainly a considerable strategical achievement. It now remained to secure the tactical results—that is to say, the blow in the N. must end in a complete victory, and the enemy in the E. must be effectually repulsed. The first of these efforts succeeded, the second did not; and from this failure arose the general battle of Grodek–Rawa Ruska and eventually the retreat beyond the San.

It should be added that Gen. von Kummer's army group had received instructions as early as Aug. 15 to invade Russian Poland from the concentration area at Cracow and to traverse that country in a north-easterly direction, thus forming a strategic protecting flank for the main army advancing on the right bank of the Vistula. It was also expected to provide the necessary reserve and nucleus for the anticipated revolutionary movement in Congress Poland. The execution of this task should not have been difficult, in view of the fact that the Russians had at first only the one cavalry division (the 14th) in the area W. of the Vistula, but in fact it proved extraordinarily difficult, as the whole army group—excepting the 7th Cav. Div.—was made up of Landsturm formations which had been thrown together on the spot and whose armament and equipment were quite inadequate.[1] In these circumstances and with these masses, it became almost a work of art to carry through the extremely exhausting marches and small skirmishes which arose out of the Russian opposition. As, too, the desired insurrection almost entirely failed to materialize, the Army Higher Command recalled the whole army group—from below Zawichost—on Aug. 24, to the right bank of the Vistula, where it was placed under the command of the I. Army, which had thenceforward 12 divisions at its disposal. In addition to this Gen. von Woyrsch's Silesian Landwehr corps had now pushed through from Prussia, so that, from Sept. 4 on, the I. Army had the strength of 14 inf. and 3 cav. divisions. This army had meanwhile continued its advance to an attack in the general direction of Lublin, according to orders. By Sept. 2, it had, after winning a succession of skirmishes, come within half a day's march of the line which had been formed S. of the central point just referred to, and was being vigorously defended by the whole of the IV. Russian Army, which had come up in the meantime. The I. Army's attempt to envelop the Russian right wing met with but slight success, but a group that had formed up behind the Russian left wing delivered a thrust which, at a later stage in the action, was to influence the course of events considerably. Before going further into this it will be well to describe the operations and battles of the IV. Austro-Hungarian Army which culminated in the eight days' battle of Komarow.

*Battle of Komarow.*—Portions of the IV. Army's II. Corps had gone into action on the afternoon of the 24th being attached to the I. Army. It was known that a strong enemy group (the XXV. Corps) was in the act of deploying before Zamosc. The IV. Army had at its disposal, prepared for prompt service, only the 3 divisions of the II. Corps, the 10th Div. of the IX. Corps and parts of the VI. Corps. The remainder (the 26th Div. of the IX. Corps and the XVII. Corps) were still forming up for deployment and in some cases had not yet arrived on the scene of action. The army commander decided to proceed to the attack with the troops on the spot, in order to bring the enemy to a stand, and then make an enveloping attack on both wings, in which he would be supported by the Archduke Joseph Ferdinand's army group (3rd and 8th Infantry, 41st Landwehr and 2nd Cav. Divs.) which had been allotted to the army command on the evening of the 24th. But first the nearest enemy corps had to be repulsed and the advance of the Russian XIX. Corps, marching from Tyszowice, cut off.

To deal with the first of these tasks a group was formed of 3 divisions (4th, 13th and 25th) of the II. Corps and the 10th Div. of the IX. Corps, under the command of General of Infantry Schemua. From 6 A.M. on Aug. 26 this group went forward in several parallel columns along the ridge W. of the Tomaszow–Zamosc road. The collision with the enemy, who were established in hastily erected shelters, took place in the afternoon. By evening the enemy had been thrown out of their positions and forced back to the northern ridge. Here they established themselves firmly in prepared positions.

The VI. Corps, advancing in three divisional columns (30th, 27th and 15th Divs.) echeloned in rear to the right, had first of all to change its direction of march from north-east to north. The 30th Div., advancing on and E. of the Tomaszow–Zamosc road, came up against the enemy (the Russian XIX. Corps) in a strong position and captured his outposts; but, in front of the main position at Tarnawatka, the division was surprised by gunfire and forced to retire to the heights N. of Tomaszow until evening. The 27th Div. (especially the 85th Infantry Regt.), advancing eastwards on the right, delivered an exceptionally brave and persistent attack which unfortunately entailed heavy losses owing to inadequate artillery preparation. The attack in itself succeeded, but the enemy could not be prevented from taking up another position farther back. The right-wing division of the corps, which had had the greatest distance to come, did not come into action that day. On the other hand a violent fire-fight had occurred in the afternoon, E. of the Huczwa at Posadow, in which a cavalry corps under Gen. von Wittmann, formed from the 6th and 10th Cav. Divs., fought with some success against a Cossack division reënforced by infantry. In the evening, after the fight, the cavalry corps retired for the night to Dyniska, followed by all portions of the IV. Army which were echeloned to the rear (26th Div. and the temporarily formed XVII. Corps consisting of the XIX. Infantry Div. and three march brigades).

For the following day (Aug. 27) the II. Corps had as their allotted task to drive the enemy back beyond Zamosc. At the same time a combined attack, in which portions of the VI. and IX. Corps took part, was organized against the Russian XIX. Corps, which had dug itself in above Tarnawatka, and in particular against the right wing. The remainder of the army was to continue its advance, but here some delay was caused by the Higher Command's granting and withdrawing alternately, three times over, the right of Archduke Joseph Ferdinand's army group to make its own dispositions. The unfavourable turn of events in the E. was the cause of the Higher Command's difficulty in deciding as to the definite distribution of this fighting group. The day (Aug. 27) began with a misfortune to the IV. Army.

[1] It was a singular fact that the Army Higher Command brought on to the field in the very first moments of the battle all the fighting forces that could by any means be got together. Nearly one-third of the battalions assembled in the deployment area were second or rather third-line troops (the third line is practically non-existent in Austria-Hungary). But this method, though demonstrating great energy in the leading and employment of fighting masses, was hardly suitable to apply to troops about to be sent to two separate theatres of war. Here again the totally inadequate armament and equipment of the Landsturm formations formed a serious drawback. Not only was their fighting power materially damaged but unusually heavy losses were suffered on the march and in action which might have been avoided.

The 10th Cav. Div., encamped on the extreme right wing, was in the early morning hours surprised and routed. Gen. Schemua's attack, on the contrary, was carried out according to programme, and his group succeeded, by evening, in throwing back the whole of the XXV. Russian Corps beyond Zamosc, some portions of it being put to flight. A large number of prisoners and 20 guns, including some heavy pieces, were left in the hands of the Austro-Hungarians.

The combined attack on the right wing of the XIX. Russian Corps, however, met with no success, and its chances became smaller in proportion as the enemy fronts visibly gained by reënforcements. Airmen's reports confirmed the approach of an enemy corps (the XVII.) from Grubieszow (Hyubieszow) and Krylow and also the direct approach from the N. (in the direction of Chelm) of enemy forces on all the lines of communication. These proved later to be the troops of the V. and XIII. Russian Corps. By evening on the same day the Austro-Hungarian 15th Div. (VI. Corps) had after a short fight reached the neighbourhood of Laszczow (Pukarzow). Acting on these various reports, the Command of the IV. Army ordered the right wing (in particular the 15th Div.) to bend backwards and take up a frontal position to the N.E. on the line Laszczow–Posadow. This was done partly to enable the advancing group (Archduke Joseph Ferdinand's 19th Div.) to deliver a blow at the enemy's flank and rear.

But the day of Aug. 28 began with a surprise attack at dawn on the 15th Infantry Div., which was massed in the narrow space near Pukarzow. After a short and costly battle, in which the divisional commander and the chief of the general staff were killed, the division was routed and in its flight westward lost the greater part of its artillery irretrievably in a swamp. The enemy pursued, and came up with the flank and rear of the 27th Infantry Div., but their progress was checked by the vigorous intervention of a brigadier, the position saved and the shattered remnants of the 15th Div. reassembled at Tomaszow. On other parts of the front the day was spent in fruitless fighting, though the enemy was at least prevented from breaking through, from the concentration area at Tarnawatka, by the now reassembled 26th Div., which unfortunately suffered heavy losses in the process. Certain portions of the II. Corps followed the enemy in his retreat northward, while others joined in the fighting on the I. Army's right wing; but the main body of the corps remained concentrated round Zamosc.

All these varying incidents notwithstanding, the fact remained that the IV. Army with all its groups had been brought up for the purpose of a uniform attack, and during the evening the Army Command issued orders for such an attack to be made by the whole army. This attack was based on the plan of battle drawn up on Aug. 25, in which the VI. Corps and the 19th Infantry Div. were to form the battle-front, while the IX. Corps (10th and 26th Divs.) was to envelop the enemy on the W. (especially in the Tarnawatka position) and the II. Corps to wheel from the N. on to the enemy's rear with two of its divisions, using a third division (the 4th) to cover the manœuvre. This cover in rear was to be made complete by the 10th Cav. Div. which had been transferred from the I. Army to the IV. for the purpose. Lastly, the Archduke Joseph Ferdinand's army group was to attack vigorously from the S. and to attempt an enveloping attack on the enemy's left flank. That is to say, there was to be a double enveloping attack by all portions of the IV. Army. On the evening of Aug. 28 reports had already come in of effective attacks by both the 19th Div. and the Archduke's divisions. These were particularly valuable on account of the surprising number of guns captured under fire, of which there were over fifty.

On August 29 this army group repeated its tactical successes and made a further haul of 26 guns. But while the enemy was being continuously reënforced, the Austro-Hungarian troops, though fighting splendidly, were greatly exhausted by their marching and fighting achievements of the previous days, and therefore did not gain ground to the desired extent. As regards the remaining parts of the battle-front, the heavy persistent fighting in the area occupied by the XVII., VI. and IX. Corps took on the character of a fixed battle broken by repeated enemy attacks, which were in particular directed against the reëntrant formed by the VI. and IX. Corps. The intention was obviously to effect a breach in this joint and break up the IV. Army front. It did not succeed; but the battle was a very costly one, owing largely to the superiority of the Russian artillery, which in a stationary fire-fight made itself plainly felt. In the II. Corps the two divisions (13th and 25th of Archduke Peter Ferdinand's army group), told off to attack in rear, commenced their wheeling manœuvres in a southerly direction. But their movements were not as rapid as could have been desired.

On the following day (Aug. 30), the fifth day of the battle, information came through from the Army Higher Command that according to an intercepted radiotelegram, a strong army body of the enemy's forces advancing from the E. had instructions to attack from Sokal the rear of the Austro-Hungarian right. This sounded unlikely, and in fact all that the IV. Army Command did was to send the 6th Cav. Div. to the Solokija in the direction of Beiz (Belz). But undeniably the report, on becoming known (it penetrated also to the Archduke Joseph Ferdinand's army group), did so far prejudice the advance that the desired wheel to the W. by this group did not take place. This was partly due, no doubt, to the fact that the enemy, realizing the magnitude of the danger which threatened him, reënforced his left wing more and more until he was able, the next day, actually to show once more a numerical superiority in artillery—and this although 80 guns had been taken from him on this sector.

On this day, too, the XVII., VI. and IX. Corps fought some violent local battles on their own part of the front. The enemy confined himself this time to defensive tactics, in contrast to the two preceding days. From the N. a vehement blow was struck on the same day against the 4th Div. of the II. Corps by 2–2½ enemy divisions. But the troops of this division, reënforced by 3 Landwehr battalions, parried bravely all the thrusts of its more powerful enemy, who pushed forward as far as the Labunka, but, being apparently incapable of any further action, retired in the night of Aug. 31 in a northerly direction. The Archduke Peter Ferdinand's group (13th and 25th Divs.) had now at last finished its wheel manœuvre southwards, so that by the evening of the same day two divisions were able to deploy in rear of the enemy. One detachment on the left wing, commanded by Col. von Stöhr, pushed forward as far as Perespa (on the Dub). On the same evening Gen. von Boroević, commanding the VI. Corps, arranged for an attack to be delivered by the 15th Infantry Div. from the S. on the enemy position to the S. of Komarow. This attack, courageously executed and well prepared by concentric artillery fire, was successful. Large masses of the enemy (the XIX. and V. Corps) within the Komarow area were surrounded on three sides, the S., the W. and the North.

The enemy, being extremely brave, did not submit to his fate, but during the night of Aug. 31 concentrated 18–20 battalions and three battery groups with which to force a way of retreat, and meanwhile withdrew from the centre of his front detachments and also transport which were set to march along the Komarow–Tyszowice road in an easterly and later a northerly direction. Groups of infantry, artillery and army service corps from the Russian left army wing were similarly withdrawn and retreated towards Grubieszow and Krylow. Into the midst of these groups burst the 2nd Austro-Hungarian Div. after violent artillery preparation, and captured 20 guns. The reports of these actions on the enemy's line of retreat came in to the Army Command in the course of the day (Aug. 31). On the morning of this day the attacking groups, mentioned above, which had been improvised on the Russian right wing, went forward against the Archduke Peter's front, which faced S., and subjected it to a rain of overwhelming artillery fire. But Col. von Stöhr's detachment on the left wing still held the Russian outermost wing in a vice, even after the fire of a Cossack division in rear had made itself vigorously felt. Naturally the Austro-Hungarian 9th Cav. Div., posted behind the Archduke Peter's front, found it hard to remain inactive. Moreover, the Archduke Peter had received a report early in the morning that an enemy column, three battalions

strong, was approaching from the north. This report—in no case a very alarming one—was afterwards proved to be false, but it caused the group commander, already shaken by the powerful artillery fire, to order a retreat—in other words a wheel to the west. This rearward wheel was carried out unmolested, but it opened to the enemy the line of retreat which had been completely blocked. This was a tactical error which greatly influenced the outcome of the battle. It was curious that, on both wings of the army, false reports of danger in the rear were able to upset a well-conceived scheme, one of which the greater part had already been put into effect, for surrounding the enemy.

The result of the fighting on Aug. 31 was the capture of Komarow, with the heavily fortified position on the heights around it and the repulse of the enemy from all parts of the front except on the E. wing, where their strong position and very considerable forces enabled the Russians to cover the wheel and retreat of the army towards Chelm and Grubieszow. This wing maintained its position throughout Sept., when the pursuit was in full force along the remainder of the front, and in this way a series of rearguard actions took place. But during the night of Sept. 1–2 the last of the Russian detachments quitted the field, and fell back, in some cases in disorder, in the direction of Grubieszow.

The eight days' battle had ended in a complete victory for the Austro-Hungarian troops, but, owing to the events just described, the complete breakdown of the enemy, which was to be the outcome of the battle, did not follow. The number of guns captured was unusually large, amounting to 156, but very serious, too, were the losses suffered by the Austro-Hungarian troops, who had been almost entirely on the offensive, amounting in all to 40,000, including 8 generals and a number of senior officers.

*With the Eastern Group (II. and III. Armies).*—In the meantime events had taken a most unfortunate turn with the Eastern group of armies. At the beginning of operations the two great units, on forming up for deployment, had had about two infantry divisions available, to which were added six cavalry divisions that had been pushed forward up to and beyond the frontier of the empire. Since the middle of Aug. these mounted troops had been in sharp contact with the enemy's cavalry masses, which were being followed by infantry, and sections of the Austro-Hungarian cavalry at times took refuge between the heads of their own infantry division.

The task allotted to the two armies was, as has been stated, to hold off "by offensive operations" the enemy forces advancing from the E. until the I. and IV. Armies should have delivered their blow. This task was no easy one, since the enemy would obviously be in a position to develop a considerable superiority, particularly as two corps (the IV. and VII.) were still rolling up. The problem could be solved either offensively or defensively. The argument for the offensive was that the greater the space won towards the E. by these two covering armies, the greater would be the security of the two attacking armies (I. and IV.). The disadvantage it involved was the distance which the columns would put between themselves and the troops still on the way to the front in proportion as they pushed forward to the east. Above all there was the danger of the Austro-Hungarian troops being drawn into decisive battles against a more powerful enemy with practically no chance of success. If, on the other hand, a solution was sought in the defensive, a tactical advantage could be drawn from the excellent defensive fronts offered by the many parallel sectional lines (deep-cut streams and rivers) which traverse the Podolian land ridges, E. of Lemberg. These fronts were particularly suited to long-drawn-out battles, especially against an enemy inclined to be clumsy in attack, as the Russians undoubtedly were. But the Army Higher Command decided to solve the problem offensively, and the two armies (the III., XI. and XII. Corps and 2 Landwehr divisions) with a strength of 2 infantry divisions began their eastward advance on Aug. 24 accordingly. From the 26th onwards there was violent fighting on the Zlota Lipa and at Zloczow. The Russians settled down at once in typical fashion to a defensive action, while the Austro-Hungarians for their part failed to make their attack uniform along the whole front. With such unfavourable tactical and numerical conditions, no amount of bravery could bring success, and both armies were forced to retreat on the evening of the 27th. But the retreat was checked at the Gnila Lipa after a day's march, and on Aug. 29 and 30 violent battles again took place at Glynjany, Przemyslany, and Bobrka. Here the VII. Corps, which had now been brought up, took part, but still no success was achieved. The losses were very heavy, especially in the XII. Corps (Gen. von Kövess), which lost nearly all its artillery. At the last moment the Army Higher Command decided to give up the attempt to advance, to abandon Lemberg and the Dniester bridgehead at Mikolajow, and to withdraw the two armies behind the line of the Wereszyca. During these battles the Russians, after repulsing the attacks, had aimed especially at throwing their weight on to the Austro-Hungarian weak left wing, and thus to carry out an enveloping movement. This was in fact only possible after the crossing of the Bug basin, E. of Lemberg.

The costly fighting waged by the two covering armies had at least gained the time needed by the other armies (the I. and IV.) for their blow, but this object might have been attained by far less costly means. Eleven infantry divisions, reënforced by successive bodies of troops from the rear up to fifteen divisions, would, if placed in a strong defensive position on the Gnila Lipa, for instance—have been able to offer a resistance which the Russians could not have broken without heavy sacrifices. These battles to the E. of Lemberg provided in fact the clearest possible illustration of the exaggeration of the offensive principle. They weakened considerably the fighting power of the troops, and the fact that they were able to take part in a leading battle a few days later only proved their excellent quality.

*Operations Introductory to the Battle of Grodek–Rawa Ruska.*—After the close of these battles fronting eastwards, which coincided with the victory at Komarow, the Austro-Hungarian Army Higher Command was confronted with grave issues. It should be added that, although the battles fought by the I. Army in its advance on Lublin had had favourable and lasting results, the enemy's growing power of resistance was making itself felt. Two solutions of the problem were now possible:— (*a*) To bring the II. and III. Armies once more into action and to let the IV. Army wheel against the N. flank of the Russian forces now pursuing the II. and III. Armies, thus bringing about a major decision in accordance with the proposed "Operation on the interior line"; (*b*) To withdraw all the armies to the now fully prepared line of the San, to defend this line and to seize any favourable opportunity for renewing the attack.

As regards (*a*), this plan involved going on with the scheme of operations in accordance with the policy originally adopted, but at the same time ignoring the fact that one part of the problem to be solved had already ended in failure. The Army Higher Command would also be bound to admit that the blow on the N., though successful, had not finally crushed the enemy. For the decisive moment—that is, for the main battle, the I. Army would not be available at all and the IV. Army would be incomplete. For there was not, in the opinion of the Army Higher Command, much time to lose—in other words, the initial operations must begin *immediately*. That being so, the IV. Army would have to give up the vigorous and effectual fighting pursuit of the defeated Russian army. And yet this was the one way in which this army could have been eliminated from the calculation for the time being. The topographical conditions for forcing a great tactical decision in the Grodek area were certainly favourable. A strong front might be formed protected by the line of the Wereszyca behind which the II. and III. Armies, unlucky up till now in their fighting, could receive such local reënforcements as would restore their full fighting power. But these conditions, again, were so obvious as to exclude any possible alternative plan of operations. To get into the right position for this, namely, "frontal defence on the part of the II. and III. Armies behind the Wereszyca, flank action and a blow from the N. on the part of the IV. Army," the IV. Army, at the close of the battle of Komarow, would have *immediately* to wheel and to execute within a narrow area a tricky manœuvre such as only units specially trained in manœu-

vring could perform. At the same time a flank-protecting force, of sufficient strength to guard against any possible attack by the defeated V. Russian Army, would have to be told off from the main body. At the IV. Army headquarters this flank-protecting force was calculated, in consideration of all the determining factors, at 4 infantry and 2 cavalry divisions, so that 8 infantry and 1–2 cavalry divisions would still be available for the blow towards the south. But the Army Higher Command, in its anxiety to keep the attacking force as powerful as possible, wanted the protecting force reduced to 3 infantry and one cavalry division. In view of the sharp defeat suffered by the V. Russian Army even such a force might possibly have sufficed had their task been exclusively that of protecting the IV. Army, but this, as will be seen, was not the case. If all the conditions here outlined were fulfilled, there was certainly reason to hope for a favourable decision which would undeniably have great tactical, and possibly even greater political, results. It was absolutely essential, however, (1) " to have an unconditional guarantee of the I. Army's power to hold out N. of the San–Tanew region, at least up to the line of the Por; (2) that the wheel manœuvre of the IV. Army should succeed completely; (3) that this army should be covered by the pinning down of the V. Russian Army on the lower Huczwa; (4) that the main attack from N. to S. in the area E. of the Wereszyca should be successful."[1]

Turning to a consideration of the scheme of operations under (*b*), the " concentration of all four armies on the San," it would seem that the obvious drawback was that it would rob the two victories of Krasnik and Komarow of their strategical importance. To give up yet another slice of Galicia would have been a disadvantage from the military and still more from the political standpoint. Yet the plan was not without considerable advantages. First and foremost the II. and III. Armies would have a still longer respite from the enemy's attentions and could have all the available reënforcements and supplies sent to them at leisure. The Russian opponent would then find himself opposed by an entrenched front, which as far as could be foreseeen he would be unable to overpower with his first- and second-line forces on the spot; while the time gained would certainly give the Austro-Hungarian armies opportunities for an offensive attack from the manœuvre area on the San. Finally the IV. Army would have one or two days in which to pursue and rout the defeated enemy before wheeling from the battle-field. In addition this scheme of operations offered the least risk in contrast to (*a*), in which practically everything was staked on one throw, a risk for which no absolute necessity could be pleaded. Nor could the fact be overlooked that—unlike Russia—the Dual Monarchy had, in the united armies at that moment in Galicia, practically all its available military forces assembled and could still absolutely rely on them. The Army Higher Command decided to solve the problem by the first scheme. It was by far the more daring, and yet, given the four conditions just enumerated, it was not unreasonable, so long as these conditions obtained, to count upon that measure of luck which must always attend the execution of a resolve to force a direct decision.

First of all the advance of the IV. Army's main body was expedited to the utmost by order of the Army Higher Command. It will be remembered that the battle of Komarow was brought to a complete finish only on Sept. 2, early in the morning. In order to carry out the Army Higher Command's instructions the heads of the newly grouped army columns would have to reach the line Belzec–Uhnow by the evening of the following day. But this line lay 30 km. to the S. of the axis of the battle-field, that is, in precisely the opposite direction from that of the previous advance.

The immense difficulties which arose out of this re-grouping, particularly in the case of the mass of transport, need not be dwelt on here. It is enough to say that by Sept. 5 everything was in order, and the army began its prescribed march southwards in three great columns. The western column (IX. Corps) was composed of 3 divisions (the 25th, 10th and 26th), the centre (VI. Corps) also had 3 divisions (the 39th, 27th and 15th), the eastern (XVII. Corps) 2 divisions (the 19th and 41st) as well as 2 march brigades. These three columns, marching towards the line Magierow–Niemirow, given as their first destination, were preceded by the 6th Cav. Div. and followed by the 3rd Infantry Div. échelonedto the left, and by the 2nd Cav. Div. still further behind. Protection in rear was provided by the Archduke Joseph Ferdinand's newly formed army group, consisting of the 4th and 13th Divs. of the II. Corps, and the 8th Inf. and 9th Cav. Divisions. The Army Higher Command's original order was that the IV. Army should continue the pursuit of the defeated enemy as long as possible and then wheel to the S., but it was also to protect the I. Army's right flank against which the enemy's attacks were becoming more and more alarming. Indeed this question of protection assumed an ever-growing importance in the eyes of the Army Higher Command and an order was presently issued placing the whole of the Archduke Joseph Ferdinand's army group under the I. Army command with the exception of certain detachments to be left behind. On these detachments the IV. Army would now depend entirely for protection in its rear. But the circumstances did not—as will be seen—admit of such a splitting up of the army group as this entailed, and the double task had undoubtedly an adverse influence on the measures taken by the group commanders. The idea of transferring the whole of the Archduke's army group to the W. was probably inspired mainly by a captured radio-telegram from the Russian Supreme Command which led the Army Higher Command to assume that " the V. Russian Army (Plehwe) was being transported by train from Wladimir Wostok to Brest Litovsk and that any danger threatening the IV. Army from the N. was therefore removed." One more example of a false or misinterpreted report which was to lead to fateful decisions!

Meanwhile, from Sept. 3 onwards, all the II. and III. Army detachments which had been thrown back behind the Wereszyca line were concentrating in preparation for a prolonged defence. On the left (northern) wing of the III. Army in particular 6 infantry divisions, ready for action, were assembled, and here too the 4th, 10th and 11th Cav. Divs. were brought together for recuperation. From this time on, these cavalry divisions were to be under the IV. Army Command. Lastly the IV. Corps was assigned to the II. Army, or rather to its right wing. Thus—apart from the Landsturm formations—the II. Army (forming the right wing of the united front) could now take the field with 9 divisions and the adjacent III. Army with 7 divisions.

The IV. Army, once it had overcome all the obstacles caused by its wheel through 180 degrees, made its advance southwards in good style, bringing up the heads of the armies to their proper destinations each day, though the left wing column (XVII. Corps) came sharply into contact with some enemy units coming from the east.

The forward push of the I. Army towards the Lublin area came to an end on Sept. 2. On the 3rd and 4th there were local battles along the line of its advance, but from Sept. 5 onwards pressure on the I. Army's right wing was so strong that it was forced to give ground and had to be withdrawn behind the line of the Por. This involved a retirement on the other parts of the front, which even the appearance on the scene of Gen. von Woyrsch's Prussian Landwehr corps failed to prevent. Even so the enemy's pressure on the I. Army's right wing was still so strong that both the I. Army Command and the Army Higher Command appealed to Archduke Joseph Ferdinand's group for help—an appeal to which it was now impossible to respond. It is evident from the map that the enemy columns, curving outward to the N., had begun to be a menace to the advancing IV. Army, while the 3rd and 8th Divs. échelonedin rear were forced to deploy fully in an eastward direction against enemy columns superior in numbers. The 8th Div. was hereby compelled to fight a very sharp and costly action. The 3rd Div. during the night of Sept. 6–7 succeeded in surprising a Russian division in the wood N. of Hujcze, but in the general fighting that ensued was forced to retire westwards and join up with the XVII. Corps.

The Army Higher Command, to whom all these events were

[1] Extract from Auffenberg-Komarow's *Aus Österreich-Ungarns Teilnahme am Weltkrieg*, Berlin, 1920.

reported in the course of the day (Sept. 27), were compelled to see that the situation on which the decision to bring about an important battle on the Wereszyca was based had now undergone a substantial change. Of the four essential conditions laid down earlier as the necessary basis for this decision, practically only one remained, or rather had been carried out:—the one relating to the wheel of the IV. Army. This manœuvre had succeeded. On the other hand, it seemed doubtful whether the I. Army could continue its resistance N. of the Tanew for any length of time; the Archduke's weak army group stood opposed to superior forces moving to outflank it; and the decisive blow from N. to S. was rendered impossible by the general enemy grouping, in which the weight had been flung on to the right (N.) wing. The Army Higher Command had therefore no alternative but to make a radical change in the original plan of operations. It would perhaps have been most to the purpose to discard altogether the guiding idea which now offered so little chance of success, and to concentrate all the armies on the already constructed line of the San. But the Army Higher Command held fast to its resolution to bring about a decisive battle in the Grodek area, though making certain concessions to meet the altered situation. Thus the IV. Army, designed as the attacking wing in the original scheme, was to be converted into the defensive wing with its front facing E., while the II. and III. Armies were to deliver the blow from the S. to N.—a complete exchange of rôles. To this end the IV. Army had to continue its wheel manœuvre and the II. and III. Armies to fight their way across the Wereszyca line, which until then formed the cover for their front, and then proceed to the attack. As a result of these operations the two opponents laid their weight on opposite wings, the Russians on the N., the Austro-Hungarians on the S. wing. This was quite against the original intention of the Austro-Hungarians, and it undoubtedly weakened their position appreciably, from a strategic and still more from a tactical point of view.

*The Battle of Grodek–Rawa Ruska. Retreat behind the San.*—Directions for the execution of this plan were issued on the afternoon of Sept. 7. The IV. Army Command at once dispatched all heavy trains in a westerly direction to beyond the San. Rzycki, to the E. of Rawa Ruska, was selected as a pivot for the continuation of the army's wheel, and here were brought into action for the fire-fight the 4th and 6th Cav. Divs. (Gen. von Wittmann), which had been selected from the very considerable cavalry masses actually on the spot. A second cavalry corps (the 10th and 11th Cav. Divs. under Gen. Nagy) was ordered to provide cover, mounted, for the army's extreme outer flank. The first of these cavalry groups executed its task admirably in a two-days' fire-fight. The army's right wing (the VI. and IX. Corps) was allowed to continue its offensive advance, partly with the object of drawing upon itself as the "defensive wing" as many as possible of the enemy's forces, and partly so as to use its infantry —so well schooled in attack—to the best advantage in an area of which a comprehensive survey was quite impossible and showed no obvious boundary line. The left wing (3rd and 8th Divs.) went back, after the heavy fighting already described, to the N. of Wittmann's cavalry corps, where it remained for the rest of the proceedings in close touch with the II. Corps (4th and 8th Divs.). This corps, being pressed by the attacking V. Russian Army, retired after a series of battles by successive stages to Tomaszow.

Following out the Army Higher Command's plan of attack, the divisions of the II. and III. Armies began an offensive advance over the Wereszyca on Sept. 8 and wrested certain advantages from the enemy, who on this front was considerably weaker; but point 325 (Stawczany–Mostki–Dornfeld), the line which the II. Army was to have reached by the evening of Sept. 8, was only taken on Sept. 11. On the other parts of the front the fighting, on Sept. 9 and 10, swung backward and forward without a decisive advantage being gained on any one section. Here the Austro-Hungarians made effective use of that form of warfare which consists in throwing up cover during the battle on an extended front—in other words, trench warfare, which later was to become the characteristic feature.

In contrast to the progress made on the right wing of the Austro-Hungarian battle-front, the development of the battle positions on the 9th, 10th and 11th showed that the left wing had recoiled. There the IV. Army was fighting against a superiority of almost two to one. The IX., VI. and XVII. Corps on that part of the front facing E. were, it is true, able to hold their position, and the artillery line with about 100 guns which had been formed behind the salient (the XVII. and II. Corps) defeated all the enemy's attempts at attack; but the Archduke Joseph Ferdinand's army group (the 4th, 8th, 13th and 3rd Divs.), which had been in action for nearly 20 days without a break, could no longer hold out after all its heavy losses, and had to be led backwards from one position to another. Even the relatively strong I. Army was forced to retire by stages, and into the gap thus formed between the IV. Army, after its wheel, and the I. Army, the V. Russian Army pushed forward slowly but surely its cavalry division and corps. This army had resumed its advance on Sept. 7 after re-forming.[1] On the same day the 8th Div. had been put out of action by a strong column of the III. Russian Army advancing from the southeast. This left the Archduke Joseph Ferdinand with only the 4th and 8th Divs. of the VI. Corps and the 9th Cav. Div. at his disposal. These weak forces could offer no permanent resistance on such open ground and, after fighting a serious battle on Sept. 9, they were withdrawn behind the line of the Rata (which ran provisionally parallel with the railway line from Jaroslau to Belzec), where they joined the 3rd and 8th Divs. of the XIV. Corps, which had likewise been severely battered.

The general strategic situation now appeared to the Army Higher Command to be untenable. Instructions were therefore issued on the afternoon of Sept. 11 to break off the fighting and retire behind the San. This retreat, facing full W., had, so far as the II. and III. Armies were concerned, only one disadvantage—the scarcity of communications available within the narrow zone of retreat. But for the IV. Army the conditions almost brought about a catastrophe.

On the afternoon of Sept. 11, the V. and XVII. Corps of the V. Russian Army, reaching out to the W., were posted, together with their own powerful artillery forces, in the direction of the rear and flank of the IV. Army. A single determined blow from these forces would infallibly have placed that army in a most hopeless situation. It was fortunate that the Russian corps in question were those that had received the worst punishment at Komarow and had therefore lost much of their fighting power. But behind this immediate danger there lay another not less serious. The Russian IV. Army, now pursuing the Austro-Hungarian I. Army in its retreat over the San, could easily detach large groups from the massed forces on its left wing and send them forward against the line of retreat of the IV. Austro-Hungarian Army, thus attacking this army at its most vulnerable point in the critical moment of the San crossing. The precautions which had to be taken against both these dangers were the more difficult to carry out in view of the fact that the whole of the army's infantry units were just then heavily engaged.

Under these circumstances the violent attack delivered in the afternoon by the united forces brought up from the E. and N.E. (the III. Russian Army) came as a welcome incident. The attack was repulsed along the whole front after an obstinate and bloody battle lasting on into the evening. Particularly in front of the 19th Div., composed of Bohemian regiments, there lay heaps of corpses. After the failure of the attack the Russians ceased fighting, and at many points whole sections of their front were discovered by reconnoitring patrols to be in retreat. Under these conditions it was an easy matter to shake off the enemy during the night of Sept. 11–12, and by following this up during the day with a powerful backward push, to break off fighting contact with the enemy almost entirely. To deal with the Rus-

[1] Incidentally the Russian V. Army, which had been defeated at Komarow, but not pursued—this being impracticable—took exactly as long to re-form and return to the field as the II. and III. Austro-Hungarian Armies after their misfortunes E. of Lemberg, although in their case pursuit did follow.

sians attacking from the N. (V. and XVIII. Russian Corps) both the cavalry corps were brought into action. Although these were units which had been greatly exhausted in the course of the operations, they succeeded, with the help of the rearguard of the XVII. and IX. Corps, in holding off the not very strong enemy pressure. It was none the less necessary to place the swampy line of the Sklo between themselves and the enemy as soon as possible, so as to rule out any possibility of further contact. But this meant crowding together all the divisions now holding a front of about 50 km. into a defile only some 15 km. wide. But although this manœuvre could be executed without such very great difficulty, the same could not be said when it came to removing the second danger already alluded to—the blow from the IV. Russian Army which had now arrived at the San. To do this, the area Laszki-Lazy-Krakowiec-Chotyniec and that portion of the line of the Sklo which borders it would have to be barricaded off with all possible haste. The IV. Army Command effected this by bringing up a weak brigade by motor from the VI. Corps, which was posted nearest to the only metalled road of communication within the zone of march. A pivot was thus formed, in the course of Sept. 13, from this brigade in conjunction with line of communication posts and field troops. These were able to repulse all attacks coming from the N., in particular one at Krakowiec on Sept. 13. These attacks, it is true, were made chiefly by cavalry, with artillery, as the enemy had not grasped the opportunity offered him of a decisive flank attack by strong forces.

In spite of this the II. Corps was kept in the Krakowiec area on Sept. 14, as a precaution. Under cover of this corps and the cavalry corps the armies carried out their retreat and crossed the San. It is true that from Sept. 13 onward the enemy's columns were active in their pursuit from the E. and made it infinitely difficult—especially for the IV. Army—to get the masses of trains brought back. Within the stretch N. of Przemysl up to and including Jaroslaw there were, including the temporary pontoon bridges, only six bridges over the San which were practicable. Even fewer were the permanent roads leading to them. It was therefore necessary to fall back on improvised roads. It has already been said that the great trains of supplies and material had been dispatched in good time to the W. and across the San; but even so, the train units that are absolutely indispensable in battle (munitions, sanitary, technical and field supplies) and in addition the supply wagons (essential in view of the many days duration of the battle) formed a train mass many kilometres long. Out of these conditions arose the immediate danger of the sensible weakening of the troops' fighting power as a result of continual protective and rearguard battles and even the contingent danger of disorder and disbandment. The commander of the IV. Army, which was most exposed to these dangers, therefore gave a plain order that no fighting in protection of the trains would be permitted. The trains were, if it became inevitable, to be given up, the teams having first been set free and the communications blocked.

In this manner the crossing of the San was achieved by all the army columns without a single fighting unit having suffered serious losses, such losses being confined to men unable to march, who succumbed because they were no longer equal to the fatigues of 25 days of operations and fighting at a stretch.

The crossing of the line of the San by all four armies brought to a close the first period of operations, which was marked by a continuous series of severe battles and difficult manœuvres within the Lemberg area. The plan of an offensive operation on the interior line had led to no useful, lasting success. Conceived under the influence of the strategical conditions that had formerly prevailed when tactical decisions were quickly reached, it was not suited to the present day when, even in fortunate cases, days—weeks—were spent in straining after victory; when the numerically weaker opponent could only seize the advantage of a momentarily favourable situation quickly enough if he were able to inflict an annihilating defeat on the isolated groups of the numerically stronger enemy forces during their concentric advance. But such success could only be attained under specially favourable circumstances and through the perfect coöperation of all subordinate commanders. In this case these conditions did not exist; and, as the space separating the Russian groups was from the first not overwide, the double blow could not succeed in spite of great isolated successes. Only the manœuvring skill of the Austro-Hungarian units, coupled with the hesitating advance of the Russian forces, enabled the Austro-Hungarians to escape unharmed from situations which might easily have led to the kind of disaster typical of an unsuccessful "operation on the interior line."

With such tremendous fighting power displayed on both sides the losses were enormous, telling with double intensity on the Austro-Hungarian as the weaker of the two armies. (A.-K.)

### II. The Summer Battles of 1915

*The Battle of Grodek–Magierow, June 16–19 1915.*—After the break-through at Mosciska Lubaczow the Russians retired slowly, fighting as they went, to a position behind the Wereszyca on the heights of Magierow and Cieszanow, and behind the Tanew. In this naturally strong line of defence, which was continued to the left by the strong Dniester line facing the Southern and VII. Armies, they proposed to fight a defensive battle to cover East Galicia and Lemberg. The continuous defeats of the last six weeks, resulting from the Austro-German spring offensive, had already caused them heavy casualties, and the loss of East Galicia would exercise a disastrous effect on the prestige of the Entente, while the evacuation of hard-won territory could not fail to exercise a demoralizing influence on the Russian army, already greatly exhausted.

The strong position selected had therefore long been carefully prepared and fortified; the country, which had been the scene of operations in Aug. and Sept. 1914, was well known to both sides. The defences constructed by the Austrians around Lemberg at this period had been strengthened by the Russians, and a circle of more or less defensible works now surrounded the Galician capital on a circumference of some 30 miles. The Grodek–Magierow position was specially designed to secure it against the first rush of the enemy. It ran from the *point d'appui* of Mikolajow along the N. bank of the Dniester to Manasterzec, then along the E. bank of the Wereszyca to Cuniow and W. of that river to the heights of Janow, whence it ran by the heights S. of Rawa Ruska to Narol Miasto, and thence by the heights N. of the Tanew to the Vistula. Farther to the rear the Russians had provided for the possibility of a break-through by constructing a second position W. of the Rawa Ruska–Lemberg railway. This line, as yet incomplete, was connected with the ring of forts near the height of Lysa Gora, N.W. of Lemberg, and was continued thence W. of the Szczerek to the Dniester.

Early in June all the Austro-German troops between the Dniester and the Vistula (Austro-Hungarian II., German XI. and Austro-Hungarian IV. Armies) had been placed under Gen. von Mackensen. His intention was to direct the attack of the centre and southern wing of the XI. Army on Magierow and thence due E., passing N. of Lemberg. The strong left wing of the II. Army was to deliver an enveloping attack upon the fortified line Janow–Kommarno, while the IV. Army, although maintaining its position in the angle of the San and Vistula, was to press N. in conjunction with the XI. Army's left, and then to advance with its right on Rawa Ruska. On the Russian side there stood facing Mackensen's army group, which comprised in all the 41st Infantry and 2 cavalry divisions, Gen. Lesch's III. and Gen. Brussilov's VIII. Armies, with same number of infantry divisions and 5 cavalry divisions.

On June 16 the Austro-Germans pressed the Russians hard along the whole line. The centre of the VIII. Russian Army offered a stubborn resistance to Böhm's centre and northern wing, while its left withdrew before his right early in the day. The Austro-Hungarian XVIII. Corps, in the course of the afternoon, stormed the Russian rearguard positions at Wolczuchy and Dobrzany, while parts of it penetrated into the part of the town of Grodek, which lies W. of the Wereszyca. On the northern front of the German XI. Army Brussilov's army on the

heights N. and N.E. of Lubaczow was heavily engaged with the combined corps and the X. Corps, while farther S. the remainder of the Army (XLI. Corps, Austro-Hungarian VI. Corps, Guard Corps and XXII. Reserve Corps) reached their objectives on the line Niemirow–Jaworow without opposition. On the front of the Archduke Joseph Ferdinand the right and centre of the Russian III. Army held its ground. In the afternoon violent fighting commenced at Cewkow and Cieplice. This ended on the following morning (June 17) in the storming of the heights N. of Cewkow by the XVII. Corps, which led to the retreat of the Russian III. Army behind the Upper Tanew and also to the evacuation of the Rudnik area. The IV. Army followed them up as far as the heights parallel with the S. bank of the Tanew, its right wing having reached N. of Cieszanow.

The II. Army, which had on the previous day worked its way up to the main Russian positions, now began its preliminary bombardment, and attacked the main crossing points. Heavy fighting took place between the XVIII. Corps and the Russian XXVIII. Corps for the possession of Grodek, as also for the bridges of Kommarno and Lubien Wk. (Great). Meanwhile on the left the Austro-Hungarian XIX. Corps crossed the Wereszyca near Kamienobrod and in conjunction with the IV. Corps began an enveloping attack against the Wielkopole ridge.

The XI. Army had now arrived in face of the Russian main position, and a general attack in the direction Rawa Ruska–Zolkiew was ordered for June 19.

On the 18th the Russians resisted fiercely on the whole front. The II. Army, however, succeeded in taking Mosty and Kommarno and in completely clearing the W. bank of the Wereszyca. The XI. Army pushed closer up to the Russian positions, against which the artillery preparation had already begun, and grouped itself for the forthcoming attack. This was to be begun at 7 A.M. on the 19th, after two hours' artillery preparation, by the XLI. Austro-Hungarian, VI. Guard and XXII. Corps, while the X. Corps and Stein's combined corps were to cover its northern flank towards Rawa Ruska. The II. Army was to capture Lemberg and to outflank and roll up the Russian line on the Dniester, while the IV. Army was to cover the XI. in the direction of the Tanew, and with its right wing corps to follow the XI. Army.

The assaulting wedge of the four corps of the XI. Army succeeded in breaking the stubborn resistance of the principal Russian front, pressing through it in the direction of Magierow, and penetrating as far as the Rawa Ruska–Lemberg railway. The II. Army had heavy fighting before the Russian main position. After two days' fierce battle the XVIII. Corps completed the capture of Grodek, the XIX. Corps took two *points d'appui* N.W. of Kamienobrod, while the IV. and the Beskiden Corps to the N. began at 5 P.M. the bombardment of the heights by Wielkopole and Stradec in the bend of the Wereszyca. The infantry assaults that followed lasted till the late evening of the 20th, and resulted at 4 A.M. next morning in the capture of the Stradec height, which was the key position for the next advance. That same evening the S. wing stormed the heights on the E. bank of the Wereszyca, while the XVIII. Corps broke through the Russian positions on the Grodek road. These successes marked the failure of the last Russian attempts to bar the way to Lemberg. Their main position was no longer tenable, and a general retreat now began on the eastern front of the XI. Army and the whole front of the II. Army.

*The Battle of Lemberg, June 20–22.*—On the evening of June 20 the Russians recognized that, in view of the disastrous breakthrough at Magierow, they could no longer hold their main position. The next line of defence ran from the Dniester at Mikolajow, along the hills E. of the Szczerek to Sokolniki, where it joined the girdle of fortified positions extending from Sokolniki by Rzesna Polska to the height of Lysa Gora. From this point it continued on the heights W. of Kulikow by Glinsko, and along the Rawa Ruska road, where it joined the unchanged portion of the Russian main position running by Brusno Stary and the heights N. of Cieszanow along the Tanew.

After the break-through at Magierow the Austro-Hungarian VI. Corps, the German Guard, and parts of the XXII. Res. Corps had pressed forward a considerable distance. The situation being still somewhat obscure, it was deemed advisable not to push the XI. Army on June 20 beyond the Lemberg–Rawa Ruska railway, particularly as wireless messages and aviation reports, while announcing the Russian forces were retiring towards the N.E., gave reason to suspect a strong hostile concentration N. of Rawa Ruska. The XI. Army in its further advance could not run the risk of being exposed to a stroke against its flank from this direction. It was therefore not to advance E. beyond the line of the above-mentioned road, and was to keep in close touch to the N. with the right flank of the IV. Army. Should the enemy retire, however, he was to be energetically pursued.

On the evening of the 20th the XLI. Corps, fighting on Mackensen's right wing, had succeeded in coming up to the strong Russian positions at Glinsko and had begun its artillery attack. Arz's Austro-Hungarian corps to the N., after repulsing several hostile counter-attacks during the previous night, had also made progress. The Guard, and parts of the XXII. Reserve Corps, after heavy fighting, had stormed the Lemberg–Rawa Ruska road and railway on a front of 7 m. N.E. of Dobrosin. On the front of the remainder of the XXII. Reserve and X. Corps there was little change, advance troops of the 19th Div. (X. Corps) occupied the village of Rawa Ruska, driving the Russians back to the heights immediately N. of it. Meanwhile on Mackensen's left army wing Stein's combined corps drove back the Russian Guard at Brusno Stary. On the IV. Army front there was no important change.

The II. Army was closely following up the retiring Russians. On the left the Beskiden Corps, completing its success of the previous night, reached the line Polany–Rokitno. The IV., XIX., and XVIII. Corps were, by the evening, close up to the fortified line, while the V. Corps, during the pursuit of June 20, reached the Szczerek below Pustomyty in the south. The 51st Honved Div. and Szurmay's corps, which had been transferred from the Southern to the II. Army, drove the Russians completely across the Dniester.

The main burden of the further attack fell upon the II. Army, which was to capture Lemberg as soon as possible, while the right wing of the XI. Army was to render the northern front of Lemberg untenable by a wide turning movement to the east. The forcing of the Dniester line by the German Southern Army, and its advance into the area E. of Lemberg against Brussilov's left flank, would materially increase the success of the plan.

The energetic advance of the II. Army on the S. wing on June 21 bore full fruit; the V. Corps succeeded in several places in capturing the Russian advanced positions on the E. bank of the Szczerek. Thus the 51st Honved Inf. Div. gained possession of a hill just N. of Usiec at the confluence of the Szczerek with the Dniester. The 14th Inf. Div. penetrated the Russian positions at Dmytrze 4 m. S. of Szczerek, while the 33rd Inf. Div. stormed the bridge to the N. of this place at Za Grobla. The XVIII. Corps, exposed to the flank fire of heavy artillery from Sokolniki, was unable to advance, but the XIX. Corps worked its way close up to the *points d'appui* of Sokolniki, Sknitów and Rzesna Polska. The IV. Corps had already captured the advanced positions of the Lysa Gora and Brzuchowice forts, making an enveloping position against them secure, while the Beskiden Corps cleared the edge of the woods W. of Zarudce.

On the XI. Army front Arz crossed the Lemberg road in the forest region S. of Dobrosin, while Lt.-Gen. François' XLI. Corps was heavily engaged round the strong positions on the heights at Glinsko, capturing the most westerly summit in the afternoon. On the remainder of the XI. Army front and that of the IV. Army the situation remained unchanged.

On the night of the 22nd the Russians, at Glinsko, threatened to the N. by the advance of Arz's corps, and to the S. by the Beskiden Corps, which had beaten them back in the actions at Zaszków and Zarudce, evacuated their now very exposed positions facing the XLI. Corps and fell back by Blyszczywody and Dzibulki. Arz on the afternoon of the 22nd penetrated deeply into the forest area N.E. of Zolkiew.

Meanwhile great events had taken place on the front of Böhm's army. In the forenoon the Beskiden Corps, after storming the heights S.W. of Kulików, advanced well beyond this place, and by pushing detachments forward succeeded in blocking the road from Lemberg by Zoltance to Kamionka.

At 4 A.M. the IV. and XIX. Corps opened a bombardment against the works on the N. and N.W. fronts of Lemberg. At 5 A.M. the 13th Landwehr Inf. Div. of the XIX. Corps penetrated into the Rzesna work on Hill 320. At 11 A.M. the 29th Div. of the same corps had captured the group of works at Sknitów, while the 43rd Landwehr Inf. Div. of the IV. Corps stormed the work Brzuchowice 348. At the same time the 13th Landwehr Div. continued the attack on the heights E. of Rzesna Polska, and the 27th and 32nd Inf. Divs. were heavily engaged round the Lysa Gora heights. Shortly after 11 A.M. this strong bulwark of the N.W. front of Lemberg also fell into the hands of the Austro-Hungarians. Under pressure of these events, the Russians, who had defended themselves by numerous counter-attacks, evacuated Lemberg. At noon Böhm's troops entered the city, which had been in Russian hands for over 10 months.

During the morning, the V. Corps had succeeded in storming the Russian positions on the heights E. of the Szczerek. In the afternoon the Russians, obviously as a result of the fall of Lemberg, into which Gen. Böhm had made his own entry at 4 P.M., abandoned their whole front facing the Austro-Hungarian II. Army.

The battle of Lemberg had thus ended in a victory for the Central Powers. By the evening of the 22nd the II. Army had reached the line Dawidow–Remenow. The effect of the victory was now making itself felt along the whole front; even the angle between the San and the Vistula, so long and stubbornly defended by the Russian XV. Corps, was evacuated by the evening of the 22nd, and the Russians fell back also before the Austro-Hungarian I. Army and the southern wing of Woyrsch's Army.

The hoped-for separation of the Russian armies, in the direction of Tomaszow and Sokal on the one hand and eastwards on the other, seemed nearer, but was not yet achieved.

The Army Supreme Command, after consultation with the German Supreme Command, now ordered new dispositions.

Mackensen was to continue the pursuit of the retreating enemy in a northerly direction with the Austro-Hungarian IV. and German XI. Armies. The Beskiden Corps was subordinated to him, in order to cover his eastern flank. The II. Army was detached from Mackensen's group and ordered to pursue eastwards by way of Busk and Zloczów, while the Southern Army was to force the passage of the Dniester below Żurawno, in order to envelop Halicz from the N. and press on further across the lower Gnila Lipa.

By the evening of the 23rd the centre and left of the Russian IV. Army were also withdrawn, on the front of Woyrsch's right wing and that of the Austro-Hungarian I. Army, to Ilża, Sienna, Ozarków and Zawichost. Both armies followed them up, Woyrsch with some rearguard fighting, the I. Army practically unopposed.

The VIII. and XIV. Corps of the Austro-Hungarian IV. Army followed the Russians to the San. On the remainder of the front of the IV. and XI. Armies the situation remained unchanged.

*Pursuit by Mackensen's Army Group Northwards; Battles in East Galicia (June 23–July 14).*—The northern wing of the II. Army met with stubborn opposition on June 23, on the line Jaryczów–Dmytrowice, but succeeded by the middle of the day in capturing a part of the Russian positions S. of the latter village. On the 24th also the II. Army found itself faced along its whole front by strong Russian lines, from the northern wing of which the Russians even delivered exceedingly violent counter-attacks. Owing to this the relief of the Beskiden Corps by a new group under Field-Marshal-Lt. Kreysa, formed of two divisions of the II. Army, appeared almost impossible.

On the German Southern Army front, also, the Russians struck hard against the two centre corps, and drove back the 19th Inf. Div. to the Dniester. Linsingen's northern wing, on the other hand, succeeded in reaching Bortniki and Chodorów, where, however, it met with fresh resistance. His southern wing was able to secure the N. bank of the Dniester below Halicz.

The pursuit by Mackensen to the N. and by Böhm to the E. had been determined automatically by the lines of the Russian retreat. The continuation of the offensive on the grand scale, however, would involve the choice of only one of these directions for the main attack; and whether this attack were delivered to the N. or to the E. there would be serious risk of a Russian assault on its open flank.

After the battle of Lemberg the Russians had concentrated their main strength between the Vistula and the Bug, while a smaller force had retired into East Galicia. Consequently, an advance by Mackensen northwards must bring him into contact with the main force of the Russians, while the protection of his eastern flank would be comparatively easy, owing to the favourable configuration of the ground in East Galicia, where, in order to assail him, the Russians would have to cross several tributaries of the Dniester flowing from N. to S. The protection of the N. flank of an army advancing eastward would be more difficult, and would require considerable covering forces. These considerations outweighed the fact that an eastward advance would be in the same direction as had hitherto been followed in the attack, and also the prospect of freeing East Galicia, which it was felt could be postponed.

The thrust to the N., moreover, was better fitted to meet the general situation. The centre of the Russian front was still bent far forward into Russian Poland. The greatest possible success to be aimed at by the Austro-Germans was to envelop this front, and, at the proper moment, helped by the pressure of their northern wing (the German E. front), to surround it. Were this to succeed, East Galicia would fall into their hands of itself. The northward advance was therefore decided on.

This might be carried out by the IV. and XI. Armies, in conjunction with the main body of the II., swinging northwards, leaving the remainder of the latter with the Southern and VII. Armies to drive the Russians out of East Galicia, or at least to contain them. A more promising alternative, however, was to leave the whole II. Army in East Galicia, while Mackensen led the northward thrust with the IV. and XI. Armies, together with fresh forces to be marched up between the II. and the XI. Armies. The shortening of the front at the end of June, as a result of the progress made by Woyrsch and Puhallo, made it possible to withdraw Puhallo's army from the front and form it up behind the inner wings of the II. and XI. Armies. Moreover, the XLI. Res. Corps, which had been ordered to the western front, was not now urgently needed there in view of recent favourable developments of the situation, and was thus for the moment available. On the other hand, the complete withdrawal of the II. Army from East Galicia appeared dangerous. The Austrian and German High Commands decided therefore for the second plan.

The regrouping between the Vistula and the Bug could be completed, and the northward advance begun, by the middle of July. The armies, meanwhile, continued to carry out their previous tasks. Mackensen followed up the retiring Russians to the N., Böhm to the E. The ever-widening gap between the two armies was provisionally filled up pending the arrival of the I. Army by the extension of the II. Army's left wing to Kamionka Strumilówa and to the Rata, and the concentration of strong reserves behind their N. wing.

By the evening of the 25th all the XI. Army's measures for the continuance of the pursuit had been completed. On the morning of the 26th the attack was to be continued on the whole front; the XVII. Corps on the right of the IV. Army, which adjoined the XI. Army on the W., was to join in and occupy the Loczwa depression N. of Cieszanów, while Böhm's wing corps to the E. of it was to advance on Kamionka Strumilówa.

The southern wing of the II. Army (5 corps), in the battle of Bobrka, stormed the positions of the Russian VI. Corps W. of the Biala Potok, and by the evening of the 25th had forced it back to the hills E. of that brook. The XVIII. and XIX. Corps also advanced successfully E. of Budków and at Dzwinogrod, while Brusilov's southern wing on both sides of Jaryczów Nowy

delivered a succession of fierce counter-attacks against the northern wing of the II. Army.

By this date the Southern Army also had not only repulsed all the attacks directed against its centre, but in the battle of Bukaczowce had occupied the whole left bank of the Dniester from Bortniki to W. of Halicz.

The attack of the VI. Guard and XXII. Corps of the XI. Army pressed forward in to the line Bojanicze–Mosty Mle–Brusno Stary. In the afternoon Mackensen's left wing corps succeeded in defeating the Russians and, carrying with it the adjoining Austro-Hungarian XVII. Corps of the IV. Army, pressed forward. By the evening of the 27th the Russians were falling back before these corps and on the whole front of the XI. Army. The II. Army had been heavily engaged on both these days, had taken Jaryczów Nowy and driven the Russians behind the Swirz; the Russians evacuated all the right bank of the Dniester before that army's S. wing and the N. wing of the Southern Army, and abandoned Halicz on the approach of Hoffmann's corps.

Next day they fell back behind the Gnila Lipa, followed by the northern wing of the Southern Army and the main body of Böhm's, while the latter's northern wing reached the Bug, S.E. of Kamionka Strumilówa. The XI. Army drove back the Russians north-westwards, its left wing corps and the adjoining XVII. Corps being heavily engaged at Narol Miasto. These corps reached Osuchy and Tarnawatka; the centre of the XI. Army gained the area S. of Laszczów and S.W. of Krystynopol, while the Beskiden Corps filled the gap between Kamionka and the Rata. The IV. Army passed the Upper Tanew.

Early on the 29th the Russians evacuated their lines facing the last-named army and retired to the ridge bordering the Tanew region to the N. The Archduke's army was in touch with them again by the evening, in spite of the difficulty of advancing over tracks through heavy sand and swamp, the destruction of the bridges and the partial obliteration of the roads, and in spite, too, of having had to fight repeated actions with the Russian rearguards.

The left wing corps of the IV. Army was, meanwhile, on the 30th, to push forward with all possible speed on Annopol, in order to menace the flank of the Russians opposing the I. Army and force them also to retire. This was successfully accomplished by midday, and before nightfall the main body of the I. Army had reached the Kamiena and the area S. of Tarlow in pursuit, while parts of it were already being prepared for transport away. On the 30th the whole of the IV. Army was able to begin its advance into the mountainous district of Krasnik and Turobin; little opposition was met with, as the Russians had fallen back to fresh positions on the heights N. of the Wyźnica and N. of the Por. The left and centre of the XI. Army, driving before them the hostile rearguards, which fell back behind the Wolica and to the area S. of Grubieszów, advanced beyond Szczebrzeźyn, Zamósz and Tyszowce.

*The Battle on the Gnila Lipa.*—Meanwhile on the Gnila Lipa front there developed a severe battle which continued till July 4. By the end of June the II. and Southern Armies had, after a series of determined attacks, secured a footing on the heights to the E. of the river at several points. On July 1 the offensive of the Southern Army here met with a decisive success. Bothmer and Kosch, advancing against the line held by the Russians' XVIII., XXIII. and XI. Corps on the front Firlejów–Bursztyn, drove them back, despite their fierce resistance and determined counter-attacks, behind the Narajówka. A slight check suffered on the same date by the 51st Honved Inf. Div. on the southern wing of the II. Army was thus fully counterbalanced, and the idea of stopping the pursuit on the Gnila Lipa, which had occurred to the II. Army, was once more abandoned.

The success achieved was increased during the following days. The Russians in face of Böhm's southern wing evacuated their ground under pressure of the Southern Army's advance, whereupon Böhm also began to move forward across the Gnila Lipa. On the night of the 2nd Böhm's centre also assumed the offensive successfully, and drove back the enemy to the heights W. of the Zlota Lipa, where they were again attacked all along their front on the 3rd.

During the night of the 4th the Russians, unable to hold out against Böhm's and Linsingen's vigorous assaults, abandoned this height also, and took up positions behind the Upper Bug and behind the Zlota Lipa. Here they intended to entrench themselves so strongly as to be able to offer a prolonged resistance. Böhm and Linsingen continued their attacks without achieving any conspicuous successes. Both sides, therefore, settled down to trench warfare, using the respite to recuperate and regroup their troops. It was not till the end of Aug. that heavy fighting again developed on the Zlota Lipa front (Campaign of Rovno).

In the middle of July Pflanzer-Baltin attacked the Russian IX. Army's lines between the Sereth and Strypa, in order to assist the main offensive by containing the Russian forces opposed to him. This was known as the battle of the Dniester (July 14–19). At the same time his northern wing advanced across the Zlota Lipa below Zadarów and established itself on the E. bank. The Russians stubbornly held their ground and delivered counter-attacks, so that six days of fighting produced no results worth speaking of. The main object of the operations had, however, been fully secured.

*Second Battle of Krasnik, July 1–14.*—The Austrian IV. Army, pushing forward into the mountainous area of Krasnik and Turobin, had now reached the area already made famous by the successful campaign of Dankl's army in Aug. 1914. The Russians were now established N. of the Wyźnica and the Por in order to stop, or at least to delay, any further advance of Archduke Joseph Ferdinand's army and the left of the XI. Army which was next to it. Strong Russian concentrations had moreover been reported at Vladimir-Volhynskiy and Grubieszów. Gen. Russky, the commander of the Russian N.W. front, appeared to be putting up a determined resistance.

The Archduke's troops had reached the Wyźnica and the Por without meeting with any particular opposition, and, in spite of their exhaustion, at once began their attacks. The Austrian X. Corps took possession of Krasnik in the first rush. At the same time the German X. Corps of the XI. Army forced the passage of the Por after overcoming stiff opposition, while the XXII. and Guard Corps secured the heights on the N. bank of the Labunka after fierce fighting.

On July 2 the offensive was to be continued by both armies at all costs. An assault group composed of five divisions of the XIV. and IX. Corps (IV. Army) was formed under command of Field-Marshal-Lt. Roth for the actual breaking through of the hostile positions E. of Krasnik. The Russians, however, anticipating some such move, had strengthened their forces at Krasnik, and forced the Austrian X. Corps by very violent counter-attacks to evacuate it. However, when, after the necessary artillery preparation, Roth's attacking wedge drove deeply into their front by way of Studzianka on July 3, the Russians had to cease their attacks; whereupon the X. Corps reoccupied Krasnik, while the 47th Res. Div. (VII. Corps) pushed four battalions to the N. bank of the Wyźnica. The right wing of the army had also continued its offensive, and with the German X. Corps had advanced completely across the Por; while the XXII. and Guard Corps had worked forward nearly as far as the Wolica after heavy fighting. The right wing of the XI. Army had reached the area Terebinn-Krylów and to the S.E. of Sokal, whence the Beskiden Corps continued the line as before to Kamionka Strumilówa. The XLI. Corps was sent back to the army and placed behind its right wing.

Puhallo's army, meanwhile, had given a striking sign of its presence by taking the Russian bridgehead of Tarlów and clearing the angle between the Kamiena and the Vistula. After this success the rest of this army was also held in readiness for transport elsewhere; Woyrsch assumed command of all the forces on the left bank of the Vistula, and Bredow's division relieved the I. Army in its positions. It was reckoned that they would finish taking up their positions in the area behind the inner wings of the II. and XI. Armies by July 13. Mackensen, meanwhile, in view

of the Russian concentration of forces at Vladimir Volhynsk and Grubieszów and the great extension of his front which must result from any further advance, resolved to stop the pursuit by the XI. Army and only to resume the further offensive northwards when Puhallo's army had joined him. The right wing of the XI. Army therefore ceased to attack. The left wing, on the other hand, had to continue its advance in order to keep pace with the progress of the Archduke's attack; it pushed forward to Czernieczin and Staw, while the centre had to repulse violent counter-attacks. On its right wing a new group from the II. Army under Szurmay took over the sector between Kamionka Strumilówa and the Rata from the Beskiden Corps.

On the 4th Roth's group met with complete success. Pressing forward into the line Stara Wies–Wilkolaz it carried with it the XVII. Corps on its right beyond Tarnawka, while the X. Corps on its left, with part of the VIII. Corps, reached Urzedowka.

Next day the attack was successfully continued along the whole front of the IV. Army. The XVII. Corps reached Gilczew and the left wing of the XI. Army the Zolkiewka.

On the 6th the X. and VIII. Corps had very hard fighting. The Russians now really seemed to be pulling themselves together for a counter-blow, and they began by offering a desperate resistance to the attack of the two corps. The Command of the IV. Army followed their attack with considerable anxiety, for they had made very little headway up to the present, while on the front of Roth's group and the XVII. Corps a cessation in the fighting was ordered so as to allow of regrouping the forces and preparing for a continuance of the break-through.

During this pause, on July 7 a serious set-back occurred. On the 5th an intercepted Russian wireless message had notified the presence of the VI. Siberian Corps and a grenadier div., both consisting of entirely fresh troops. On the 6th the Russian resistance noticeably stiffened and on the 7th the Siberian VI. Corps energetically attacked the inner wings of the XIV. and X. Corps. The 106th Inf. Div. and the X. Corps were driven back to the heights N. of Krasnik and behind the Wyźnica, and the right wing of the VIII. Corps had to retire in conformity. During the next few days the Russians secured further successes, forcing back the XVII. Corps and the 47th Reserve Div. of the VIII. Corps. But by the 10th the IV. Army, which had been hastily reënforced by two cavalry divisions and some Landsturm formations from the I. Army, had overcome the crisis by its own strength. The 4th Inf. Div. from the I. Army, which had been sent to Zolkiew, had, it is true, now been placed under it, but before its arrival the Russian attacks had died down and even showed signs of turning into a retreat.

This counter-blow, thus fortunately parried, had no serious effect on Mackensen's army, of which the regrouping could be carried out as planned, under cover of the activity on the IV. Army's front, almost without the enemy noticing it.

After the capture of the Tarlów bridgehead the transfer of the I. Army proceeded rapidly. The Army Command arrived in Zolkiew by one of the earliest trains, and there took over the command of Szurmay's group and superintended the assembly of the army on the Rata and the Bug as far as Krylów. The German High Command was at the same time arranging for the formation of a new German army, "the Army of the Bug," under Gen. von Linsingen, which was to operate between the XI. and I. Armies, and to consist of 7 infantry and one cavalry divisions from the XI. Army and one infantry and one cavalry division from the Southern Army.

The Russians, in the meantime, had also undertaken a regrouping of their forces. At the beginning of the battle of Krasnik the German XI. and Austro-Hungarian IV. Armies were faced by the Russian III. Army, which had been gradually brought up to a strength of 26 infantry and 6 cavalry divisions. This force, already too large for effective handling from a single centre, had further been increased by the arrival of two fresh corps in the Wlodawa area, of which the one was to reënforce the III. and the other the IV. Army. In order to simplify the problem of command the Grand Duke Nicholas resolved to break up the III. Army, the five western corps forming the new III. Army, and the other six being reorganized into a new XIII. Army. After completion of the regrouping, Mackensen's command consisted of the IV., XI., Bug, and I. Armies. With these he was to subdue Russian Poland by means of a new offensive to the N. in conjunction with Woyrsch and the IX. German Army W. of the Vistula. (E. J.)

**LEMONNIER, ANTOINE LOUIS CAMILLE** (1844–1913), Belgian poet (*see* 16.415), published among his later works *L'Amant passionné* (1905); *Tante Amy* (1906); *La maison qui dort* (1909) and *La chanson du carillon* (1911); as well as *L'école belge de peinture, 1830–1905* (1906). He died at Brussels June 13 1913.

See L. Bazalgette, *Camille Lemonnier* (1904).

**LENIN** (originally OULIANOV), **VLADIMIR ILICH** (1870– ), Russian Communist leader, was born in Simbirsk in 1870, his father being an official of middle rank—a district inspector of schools. His elder brother, Alexander, was an active member of the terrorist party of the "Will of the people." In 1887 he planned with some friends to assassinate Emperor Alexander III. by the explosion of an infernal machine: the plot was discovered and Alexander Oulianov was hanged together with four of his accomplices. Vladimir entered the university of Kazan as a student of law, but was expelled for taking part in revolutionary agitation. He went to St. Petersburg and passed his bar examination there. He did not practise long, but joined a secret organization of professional revolutionists. Towards the end of the 'nineties he was arrested, escaped and went abroad. He had joined the Social Democratic movement which in those days was spreading widely in Russia. Plekhanov and Struve were at that time the chief exponents of Marxism: they adopted the teaching of Karl Marx as regards the necessary sequence of economic stages—feudalism, *bourgeois* individualism, capitalism, proletarian upheaval. In that scheme the rise and growth of capitalism was considered to be a necessary preliminary to social revolution, and it was thought that Russia had hardly entered that stage: therefore it was not ripe for a social upheaval. Lenin was in agreement with these views for some time. But while Struve, and to a less degree Plekhanov, were induced by this admission to seek an alliance with Liberal intellectuals in their struggle against Tsarism, Lenin (as he had taken to calling himself), together with Martov, Axelrod and other fiery spirits, forsook the Liberal platform and strove for a violent outbreak of a downright class war. This produced a split in the ranks of Social Democracy between the Majority and Minority sections (Bolsheviks and Mensheviks). This split, first apparent in the Congress of 1903, gradually widened. At the third Congress in 1905 it led to the formation of two parties, the Bolsheviks meeting in London, and the Mensheviks in Geneva.

The revolution of 1905 saw Lenin again in St. Petersburg, and he worked a good deal behind the scenes, inciting to violence, advising a boycott of the Duma, hostility to the Cadets, etc. But he did not play any part in the Soviet of workmen, and disappeared as soon as it became clear, after the crushing of the outbreak in Moscow, that the troops and the people were not on the side of the revolutionaries.

During his second stay abroad (1906–17) Lenin published several pamphlets and books which attracted a good deal of attention. In the *Two Tactics* (1905) he had announced that terrorism was inevitable as a weapon in the hands of revolutionists. He said among other things: "The Jacobins of contemporary social democracy—the Bolsheviks—desire that the people, that is the proletarians and peasants, should settle the reckoning of Monarchy and Aristocracy in plebeian fashion—by ruthlessly annihilating the enemies of freedom."

The disillusionment as regards material means for improving the life of mankind had given rise in many minds to a quest for religion, and this mystic current had attracted men like Struve, Bulgakov, Berdiayev and others. Lenin regarded such strivings as a betrayal of the claims of the labouring class. His book on *Materialism and Empirio Criticism* (1909) heaps abuse on idealistic philosophers and religious teachers of all schools and creeds. He does not enquire into the abstract right and wrong of any case, but subjects it to the acid test of proletarian interests.

delivered a succession of fierce counter-attacks against the northern wing of the II. Army.

By this date the Southern Army also had not only repulsed all the attacks directed against its centre, but in the battle of Bukaczowce had occupied the whole left bank of the Dniester from Bortniki to W. of Halicz.

The attack of the VI. Guard and XXII. Corps of the XI. Army pressed forward in to the line Bojanicze–Mosty Mle–Brusno Stary. In the afternoon Mackensen's left wing corps succeeded in defeating the Russians and, carrying with it the adjoining Austro-Hungarian XVII. Corps of the IV. Army, pressed forward. By the evening of the 27th the Russians were falling back before these corps and on the whole front of the XI. Army. The II. Army had been heavily engaged on both these days, had taken Jaryczów Nowy and driven the Russians behind the Swirz; the Russians evacuated all the right bank of the Dniester before that army's S. wing and the N. wing of the Southern Army, and abandoned Halicz on the approach of Hoffmann's corps.

Next day they fell back behind the Gnila Lipa, followed by the northern wing of the Southern Army and the main body of Böhm's, while the latter's northern wing reached the Bug, S.E. of Kamionka Strumilówa. The XI. Army drove back the Russians north-westwards, its left wing corps and the adjoining XVII. Corps being heavily engaged at Narol Miasto. These corps reached Osuchy and Tarnawatka; the centre of the XI. Army gained the area S. of Laszczów and S.W. of Krystynopol, while the Beskiden Corps filled the gap between Kamionka and the Rata. The IV. Army passed the Upper Tanew.

Early on the 29th the Russians evacuated their lines facing the last-named army and retired to the ridge bordering the Tanew region to the N. The Archduke's army was in touch with them again by the evening, in spite of the difficulty of advancing over tracks through heavy sand and swamp, the destruction of the bridges and the partial obliteration of the roads, and in spite, too, of having had to fight repeated actions with the Russian rearguards.

The left wing corps of the IV. Army was, meanwhile, on the 30th, to push forward with all possible speed on Annopol, in order to menace the flank of the Russians opposing the I. Army and force them also to retire. This was successfully accomplished by midday, and before nightfall the main body of the I. Army was able to begin its advance into the mountainous district of Krasnik and Turobin; little opposition was met with, as the Russians had fallen back to fresh positions on the heights N. of the Wyźnica and N. of the Por. The left and centre of the XI. Army, driving before them the hostile rearguards, which fell back behind the Wolica and to the area S. of Grubieszów, advanced beyond Szczebrzeźyn, Zamósz and Tyszowce.

*The Battle on the Gnila Lipa.*—Meanwhile on the Gnila Lipa front there developed a severe battle which continued till July 4. By the end of June the II. and Southern Armies had, after a series of determined attacks, secured a footing on the heights to the E. of the river at several points. On July 1 the offensive of the Southern Army here met with a decisive success. Bothmer and Kosch, advancing against the line held by the Russians' XVIII., XXIII. and XI. Corps on the front Firlejów–Bursztyn, drove them back, despite their fierce resistance and determined counter-attacks, behind the Narajówka. A slight check suffered on the same date by the 51st Honved Inf. Div. on the southern wing of the II. Army was thus fully counterbalanced, and the idea of stopping the pursuit on the Gnila Lipa, which had occurred to the II. Army, was once more abandoned.

The success achieved was increased during the following days. The Russians in face of Böhm's southern wing evacuated their ground under pressure of the Southern Army's advance, whereupon Böhm also began to move forward across the Gnila Lipa. On the night of the 2nd Böhm's centre also assumed the offensive successfully, and drove back the enemy to the heights W. of the Zlota Lipa, where they were again attacked all along their front on the 3rd.

During the night of the 4th the Russians, unable to hold out against Böhm's and Linsingen's vigorous assaults, abandoned this height also, and took up positions behind the Upper Bug and behind the Zlota Lipa. Here they intended to entrench themselves so strongly as to be able to offer a prolonged resistance. Böhm and Linsingen continued their attacks without achieving any conspicuous successes. Both sides, therefore, settled down to trench warfare, using the respite to recuperate and regroup their troops. It was not till the end of Aug. that heavy fighting again developed on the Zlota Lipa front (Campaign of Rovno).

In the middle of July Pflanzer-Baltin attacked the Russian IX. Army's lines between the Sereth and Strypa, in order to assist the main offensive by containing the Russian forces opposed to him. This was known as the battle of the Dniester (July 14–19). At the same time his northern wing advanced across the Zlota Lipa below Zadarów and established itself on the E. bank. The Russians stubbornly held their ground and delivered counter-attacks, so that six days of fighting produced no results worth speaking of. The main object of the operations had, however, been fully secured.

*Second Battle of Krasnik, July 1–14.*—The Austrian IV. Army, pushing forward into the mountainous area of Krasnik and Turobin, had now reached the area already made famous by the successful campaign of Dankl's army in Aug. 1914. The Russians were now established N. of the Wyźnica and the Por in order to stop, or at least to delay, any further advance of Archduke Joseph Ferdinand's army and the left of the XI. Army which was next to it. Strong Russian concentrations had moreover been reported at Vladimir-Volhynskiy and Grubieszów. Gen. Russky, the commander of the Russian N.W. front, appeared to be putting up a determined resistance.

The Archduke's troops had reached the Wyźnica and the Por without meeting with any particular opposition, and, in spite of their exhaustion, at once began their attacks. The Austrian X. Corps took possession of Krasnik in the first rush. At the same time the German X. Corps of the XI. Army forced the passage of the Por after overcoming stiff opposition, while the XXII. and Guard Corps secured the heights on the N. bank of the Labunka after fierce fighting.

On July 2 the offensive was to be continued by both armies at all costs. An assault group composed of five divisions of the XIV. and IX. Corps (IV. Army) was formed under command of Field-Marshal-Lt. Roth for the actual breaking through of the hostile positions E. of Krasnik. The Russians, however, anticipating some such move, had strengthened their forces at Krasnik, and forced the Austrian X. Corps by very violent counter-attacks to evacuate it. However, when, after the necessary artillery preparation, Roth's attacking wedge drove deeply into their front by way of Studzianka on July 3, the Russians had to cease their attacks; whereupon the X. Corps reoccupied Krasnik, while the 47th Res. Div. (VII. Corps) pushed four battalions to the N. bank of the Wyźnica. The right wing of the army had also continued its offensive, and with the German X. Corps had advanced completely across the Por; while the XXII. and Guard Corps had worked forward nearly as far as the Wolica after heavy fighting. The right wing of the XI. Army had reached the area Terebinn-Krylów and to the S.E. of Sokal, whence the Beskiden Corps continued the line as before to Kamionka Strumilówa. The XLI. Corps was sent back to the army and placed behind its right wing.

Puhallo's army, meanwhile, had given a striking sign of its presence by taking the Russian bridgehead of Tarlów and clearing the angle between the Kamiena and the Vistula. After this success the rest of this army was also held in readiness for transport elsewhere; Woyrsch assumed command of all the forces on the left bank of the Vistula, and Bredow's division relieved the I. Army in its positions. It was reckoned that they would finish taking up their positions in the area behind the inner wings of the II. and XI. Armies by July 13. Mackensen, meanwhile, in view

Port Sunlight, became models of their kind. Schools, clubs, libraries, rest-rooms, a hospital and many other institutions for the benefit of the workpeople were included, and a system of co-partnership was inaugurated in 1909 with successful results. The brothers also established works at Mannheim in Germany, as well as businesses in France; Switzerland; Sydney, N.S.W.; Boston, Mass.; Toronto; Japan, and elsewhere. In the Belgian Congo they acquired vast forests for their supply of palm-oil, and in 1911 they established there the settlement of Leverville. In 1900 Mr. Lever unsuccessfully contested the Wirral division of Cheshire as a Liberal, and in 1906 was elected, retaining his seat till 1910. In 1911 he was made a baronet, and in 1917 he was raised to the peerage as Baron Leverhulme. In 1912 he bought Stafford House, the London home of the Dukes of Sutherland, and presented it to the nation as a home for the London museum, and in 1918 he bought the island of Lewis in the Hebrides, Scotland, as a centre for a reorganized fishing industry.

**LEVY, AUGUSTE MICHEL** (1844–1911), French geologist (*see* 16.519), died Sept. 21 1911.

**LEWIS, SIR GEORGE HENRY,** 1ST BART. (1833–1911), English solicitor, was born at Ely Place, Holborn, April 21 1833. Educated at University College, London, he was articled in 1856, and became head of the firm of Lewis & Lewis. He was engaged in a very large number of notable public cases, including the Bravo poisoning case, the Hatton Garden diamond robbery, and the Overend-Gurney and other banking prosecutions. Later (1887) he was solicitor for Mr. Parnell and the Irish party in the Parnell Commission. Sir George Lewis, who was made a baronet in 1893, was for many years the most prominent man in his profession, and had a unique practice, especially in advising on difficult family affairs; he was the trusted confidential adviser of many important people. He died in London Dec. 7 1911, being succeeded in the baronetcy by his son.

**LEWIS, ISAAC NEWTON** (1858– ), American soldier and inventor, was born at New Salem, Pa., Oct. 12 1858. On graduating from the U.S. Military Academy in 1884 he was commissioned second lieutenant of artillery, and seven years later was made first lieutenant. From 1894 to 1898 he was a member of the board on the regulation of coast artillery fire in New York harbour. For the next four years he was recorder of the board of ordnance and fortification in Washington. He was promoted captain in 1900, and the same year made a study of ordnance in Europe. His report led to the rearmament of the U.S. field artillery. From 1904 to 1911 he was instructor and director of the coast artillery school at Fort Monroe, being promoted major in 1907 and lieutenant-colonel in 1911. In 1913 he was made colonel and retired from active service. The same year a machine-gun of his invention (the Lewis gun) was accepted by the British Government after it had been rejected in America. During the World War it was extensively used by the different Allied armies, by the American navy, and in American and Allied airplanes. Colonel Lewis refused to accept any of the royalties, amounting to about $1,000,000, on his guns made for the American Government after the United States entered the World War. His other numerous inventions included a time-interval clock-and-bell system of signals, a replotting and relocating system for coast batteries, an automatic sight, quick-reading mechanical verniers used in coast defences, and a speed indicator for locomotives.

**LEWKOWITSCH, JULIUS** (1857–1913), British chemist, was born at Ostrovo in Prussian Silesia in 1857. He graduated as doctor of philosophy at Breslau, afterwards working in the Berlin agricultural high school and at Heidelberg University. About 1888 he came to England and became a naturalized British subject. He devoted much time to stereo-chemistry and to developing the industrial technology of fats and oils, becoming the first living authority in that branch of chemistry. He died at Chamonix Sept. 18 1913.

**LIBERIA** (*see* 16.530).—From 1912 this negro republic on the Guinea Coast of Africa was under the virtual protection of the United States, an American officer being receiver-general and financial adviser to the Government. Pop., 1920 estimates, 1,500,000 to 2,100,000. Of the inhabitants about 12,000 are American negroes or their descendants and some 50,000 negroes in the coast region are "assimilated," that is they have adopted the religion (Christianity), standards and language (English) of the American negroes, whose authority extends, at least nominally, over the whole country. Europeans number under 200. Monrovia, the capital and chief seaport, had (1920) about 6,000 inhabitants. It has two wireless stations and direct cable connexion with Europe and New York.

The inability of the Liberian Government to control the tribes in the interior led to many boundary disputes with France, whose Guinea and Ivory Coast colonies adjoin Liberia on the N. and E. By an agreement concluded in 1910 France obtained some 2,000 sq. m. which Liberia claimed but had not administered. This reduced the area of the republic to about 40,000 sq. miles. The new frontier was delimited by a commission on which Liberia was represented by two Dutch officers. By an Anglo-Liberian Convention dated Jan. 21 1911 an exchange of territory advantageous to both parties was effected with the British protectorate of Sierra Leone, which acquired the district of Kanre Lahun and ceded the Morro Forest district.

At that time—1910–12—the condition of Liberia was far from satisfactory. It was burdened with debt, it had granted concessions to various companies (British, German and others) without being able to control the regions in which the concessionaires were to work; after over 60 years' existence the authority of the Government rarely extended more than 20 m. from the coast. The remnants of Samory's army, and other malcontents with French rule, took refuge in the Liberian forests and raided across the frontier. This formed a constant source of exasperation to the French (and in minor degree to the British) and, not unnaturally, the French saw in the annexation of the hinterland the only method of securing peace in their own possessions. There were no railways and no roads in the country, whose great natural resources in coffee, oil palms, rubber, timber, etc., were almost totally neglected. Thus in 1911 the total value of all exports was but £230,000.

It appeared as if the experiment of "running" the country by American negroes on the lines of the Constitution of the United States would collapse, but the intervention of the American Government led to a reorganization which gave the Liberians a new start. In 1911 the Liberian Legislature passed an Act approving the raising of a loan through the good offices of the United States to refund or extinguish all debts of the republic, domestic and foreign. Before the loan was issued all outstanding claims against Liberia had to be fixed and some delay ensued owing to the discrepancy between the German claims and the views of the Liberian Government. The German claims were energetically pressed, and in 1911 the gunboat "Panther" was anchored for a month off Monrovia, with guns trained on the executive mansion. All difficulties were, however, overcome by June 1912, when an international loan of $1,700,000 (£340,000) was raised, the bonds being payable in New York, both as to principal and interest, in gold coin of the United States; the bonds to be issued for a period of not fewer than 40 years, and for this period the control of the finances of Liberia passed in effect into the hands of the United States. The customs duties, the rubber tax, etc., were pledged as security for the loan, which is administered by an American receiver-general assisted by a British, a French and (originally) a German receiver, the American receiver-general acting as financial adviser to the Government. In accord with another provision for the security of the revenue a frontier police force was organized by officers of the U.S. army. This force enabled the Government to obtain control of the Kru country in the south, and of N. Liberia. Under the new financial control expenditure was kept within the limits of the revenue, and internal peace was secured.

The new system had not had time to show any marked results when the World War began. Its effect was greatly to restrict trade which up to that time was chiefly with Germany, Great

Britain and Holland and had an annual average value of about £450,000. By 1914 fully two-thirds of the trade was in the hands of Germans, by whom the wireless station at Monrovia was owned and worked, as well as a four-cable line to New York. Deprived of their own colonies and ejected from the French and British possessions on the Gulf of Guinea the Germans during the war found in Liberia their last foothold in W. Africa. The position created was as unsatisfactory to the Liberians as to the Allied Powers, but Liberia was itself helpless. However, soon after the entry of the United States into the war the Liberian Government (May 1917) broke off diplomatic relations with Germany, the president, Mr. Daniel E. Howard, announcing that Liberia would coöperate sympathetically with the United States, Great Britain and France. On Aug. 4 a state of war with Germany was declared, and the Germans in Liberia were deported. The only act of hostility reported in Liberia was the bombardment of Monrovia by a German submarine on April 10 1918, following a refusal to dismantle the wireless station. The Germans destroyed the station, killed four persons and sunk the armed steamer "President Howard," which constituted the whole of the Liberian "navy." Liberia was one of the signatories of the Treaty of Versailles. In Jan. 1920 Mr. C. D. B. King took office as president for a period of four years. Mr. King had been the peace delegate to Paris in 1919 and in the autumn of that year had paid a lengthy visit to America. An announcement was made, with reference to financial control, that Liberia would henceforth be placed under the exclusive supervision of the United States.

After the war renewed efforts were made by British and American interests to develop the trade and resources of the country, but up to 1921 little more than preliminary work had been done. Indigenous coffee is the staple product—761,300 lb. of coffee were exported in 1917. In the same year the export of cocoa was 65,000 lb.; of piassava fibre (prepared from the raphea palm), 5,912,000 lb.; of palm oil, 336,000 gallons. Since 1914 the trade had been almost wholly with Great Britain, which in 1920 imported from Liberia goods to the value of £513,000 and exported to Liberia goods valued at £271,000. (The corresponding figures for 1913 were £56,000 and £90,000.) Shipping was also mainly British. In 1919 of the 244 vessels visiting Monrovia 116 were British, and British tonnage was 483,000 out of a total of 622,000 tons.

Revenue, which had been $618,800 (£124,000) in 1912–3 (accounts are kept in American currency though the money chiefly used is British), had fallen to $273,000 (£54,600) in 1914–5, and remained at about that figure for the next three years. Expenditure was rigidly curtailed, and obviously the Government had no money to spend on reproductive works.

Liberia continued to be of special interest to the naturalist. A valuable fodder grass, the *Pennisetum purpureum*, was discovered and in 1912 the first living specimens of pigmy Liberian hippopotami were captured and exported (by Maj. Schomburgh, who sent specimens to American and German zoölogical gardens).

See *The Republic of Liberia* (1920) by R. C. F. Maughan, since 1913 British consul-general at Monrovia, and Sir A. Sharpe, "The Hinterland of Liberia," *Geog. Jour.* (vol. lv., 1920). (F. R. C.)

**LIBERTY, SIR ARTHUR LASENBY** (1843–1917), English merchant, was born at Chesham Aug. 13 1843, the son of a Nottingham lace manufacturer. He was educated at the university school of Nottingham and at 19 became manager of the shop in Regent St., London, which he developed into an important adjunct of the art world of the period. In 1875 he became independent and at once set to work to adapt Eastern art in weaving and design to Western requirements, becoming famous both for his textiles and for his colourings. He was a fellow of the Asiatic Society and chairman of the advisory committee of the Royal School of Art Needlework at Kensington. Knighted in 1913, he died at Gt. Missenden, Bucks., May 11 1917.

**LIBERTY LOAN PUBLICITY CAMPAIGNS.**—The success of the Liberty Loan campaigns in the United States, after its entrance into the World War, must be judged in the light of the fact that, before 1914, America had little experience of raising huge amounts of capital for lending abroad. At the outbreak of the war the United States was a debtor nation. It was indebted to foreign creditors on capital account to the estimated extent of $3,500,000,000. Since July 1913 there had been, moreover, a steady export of gold, which had occasioned grave apprehension among American bankers; and in June 1914 New York clearing-house banks had fallen $50,000,000 below their legal gold reserve requirements. On July 31 1914 drafts payable in gold were coming due immediately on the arrival of shipments of American railway and industrial securities sold abroad, and later, but within a few months, obligations to the amount of $600,000,000 would have to be met with gold in London and on the European continent. Foreign exchange leaped to the unheard-of figure of $7 for the pound sterling early in August. By Jan. 1 1915, however, financial conditions in the United States assumed a different aspect in consequence of the action of the bankers, assisted by the U.S. Treasury, in devising and making available a gold fund of $100,000,000 to protect the country's foreign credit. The warring nations were placing in haste huge orders for munitions of war, foodstuffs and general supplies. Exchange rates thus not only became normal, but turned in favour of the United States. Exportation of gold ceased, and its flow towards the United States began. In Sept. 1915 England and France contracted in New York for the Anglo-French loan of $500,000,000. From Sept. 1 1915 to April 15 1917, a period of 19 months, the belligerent nations negotiated loans in the United States amounting to $1,650,000,000, at a rate not exceeding 5½%; and the net balance of imports of gold into the United States during the same period was $1,074,777,133. These conditions in April 1917 are significant in contrast with those of July 30 1914.

When the United States entered the war it was apparent that huge sums would have to be made available by the U.S. Government for the use of the Allies as well as for its own expenses. The stupendous cost of the war to England, France and Italy clearly indicated that the United States must secure a war-chest of thousands of millions of dollars. Taxation and bond issues were the only methods by which the needed money could be raised. Congress, April 24 1917, 18 days after the declaration of a state of war, authorized the Secretary of the Treasury to issue bonds of the United States to the extent of $5,000,000,000. These Liberty Loan Bonds carried interest at the rate of 3½% per annum, were tax-exempt, and convertible into bonds bearing higher interest if any subsequent series should be issued at a higher rate. The unprecedented issues of loans by foreign Governments, and the purchase of large blocks of American railway and industrial securities which foreign holders had unloaded on the New York market during 1915 and 1916, however, seemed to have absorbed all the fluid money in the country. It was most uncertain how 3½% bonds would fare in the open market while those of England and France were yielding 5½%, and railway and industrial securities carrying 6% were selling below par. Leading bankers in all parts of the country advised that the issue should not be in excess of $500,000,000, in the belief that the market could not absorb more. In the face of these discouraging advices the Secretary of the Treasury determined, nevertheless, to be influenced only by the essential requirements of the Government. He fixed upon the amount of $2,000,000,000, and offered the loan to the public May 17 1917, believing that an appeal to the patriotism of the people would bring a satisfactory response. This first offering closed June 15 1917, with subscriptions by 4,000,000 people aggregating $3,035,226,850. Then, within the next 23 months, at intervals of about 6 months, there followed the Second, Third, Fourth and Fifth Liberty and Victory loans, aggregating $19,000,000,000 more, and in each campaign the offerings were over-subscribed. But this was only as a result of an appeal to the public such as had never before been attempted.

Appeals to the people, however patriotic they may be, cannot be forcefully made without organization.[1] A selling agency had to be created, one that would be nation-wide in its operations, replete with energy, enthusiastic in its patriotism, and determined to uphold American honour and credit.

Geographically the United States is divided into 12 financial sections, each of which is termed a Reserve Bank District, with its Reserve Bank. The Federal Reserve Board was located in Washington. The system was but newly created, and had begun to function early in 1915. After the United States entered the

[1] For an account of what was done in England, for the same purpose, see the article WAR LOAN PUBLICITY.

war a War Loan Organization under the Treasury Department was established at Washington, and in each of the 12 Federal Reserve Districts a Central Liberty Loan Committee was constituted, with the governor of the Reserve Bank as chairman, and to these committees was entrusted the work of selling the bonds in their respective districts.

The Treasury Department allotted to each district the amount of bonds it was to sell, and each central committee divided the allotment throughout its territory, calling upon its sub-committees in various localities to have their quotas subscribed. The men who served on the central committees and on the principal sub-committees represented the most capable, experienced and influential men in their respective communities—financial, professional and industrial. The success of all the loans was largely due to the perfection of the selling organizations and to the energetic action of the central committees under the direction of the Treasury Department. American women figured in every great war movement, and in these campaigns they proved their value in an entirely new capacity as sellers of bonds. They perfected a nation-wide organization—the National Woman's Liberty Loan Committee, which coöperated with the Liberty Loan Organizations of the Federal Reserve Districts. They had enrolled on their committees 800,000 women during the campaigns for the Fourth and Fifth loans.

Inasmuch as New York City is the heart of financial America, and as the Second Federal Reserve Bank is there, a description of the bond-selling campaign there will be sufficient. The Central Liberty Loan Committee of the Second Federal Reserve District was composed of Benjamin Strong, chairman; James S. Alexander (President National Bank of Commerce); George F. Baker (chairman board of directors, First National Bank); Allen B. Forbes (Harris, Forbes & Co.); Walter E. Frew (president Corn Exchange Bank); Gates W. McGarrah (President Mechanics and Metals Bank); J. P. Morgan (J. P. Morgan & Co.); Seward Prosser (president Bankers' Trust Co.); Charles H. Sabin (president Guaranty Trust Co.); Jacob H. Schiff (Kuhn, Loeb & Co.); Frank A. Vanderlip (president National City Bank); Martin Vogel (Assistant Treasurer of the United States, in charge of the Sub-Treasury in New York, and representative of the Secretary of the Treasury); James N. Wallace (president Central Union Trust Co.); Albert H. Wiggin (president Chase National Bank); and William Woodward (president Hanover National Bank). These men met daily during each campaign. They formed sub-committees on distribution pub icity speakers' bureaus, banks and trust companies, various industries, manufactures and professions, each composed of the leading men in their respective industries and professions. Every city town and village had its Liberty Loan Committee as part of this huge organization. Each district was given its allotment, and daily returns were reported to the Central Committee throughout each campaign. If the reports from any district showed that it was lagging behind, speakers of national repute were sent to arouse it. Campaigns of education were inaugurated making widely known the causes of the war, the object sought by victory, and the necessity of financing the Allies and supporting the military arm of the Government. To the thoroughness of the educational campaign may be attributed much of the success of the issues. It convinced everyone that each man, woman and child must "do his bit." It made an army of workers with an individual responsibility. No device to assemble crowds was ignored, and there was no assembly without its speakers. Bands, processions, parades, balloon ascensions, flights of aeroplanes dropping leaflets, steeple climbers, altars of liberty, "Nation Days" for aliens and citizens of foreign birth, and, later, captured tanks, cannon and submarines, pyramids of German helmets—all were used. Walls were covered with special cartoons; magazines and newspapers contained full pages of advertising. "Buy a bond" was a slogan from which there was no escape. In café and club, in hotel corridor and restaurant, between the acts in the theatre, and in all public places came the cry "Buy a bond." The jargon of the money market was abandoned. It was not the question of investment *versus* investment, or interest rate *versus* interest rate. It was that of the National Treasury in need of funds. Performance of patriotic duty and pride in American institutions was the key of the educational campaign. When the great "drives" came the nation responded to a man. Every village and city in the land sought not merely to sell its quota of bonds, but strove to "go over the top."

The Treasury Department and the central committees realized that the people did not have sufficient available money to pay in cash for the bonds, and therefore the slogan "Borrow, buy and save" was employed, and the banks throughout the country were urged to make loans freely to subscribers who offered bonds as collateral. The banks aided the small investors by financing their subscriptions, permitting them to pay off in monthly instalments, with interest at the coupon rate. The large mercantile and industrial establishments likewise financed the subscriptions made by their employees. In the later campaigns coupon instalment books were introduced. The banks aided the large investor to subscribe beyond his available cash resources by loaning on the subscriber's three-months note, with the bonds as collateral, and with the privilege of one, two or three renewals of three months each, with interest at the coupon rate. Usually a substantial payment in reduction of loan was required and the rate of interest raised at the end of the renewal periods. There was no special rule, each bank using its own judgment in individual cases. The banks, in turn, rediscounted these notes at their Federal Reserve Banks, thereby maintaining a liquid position. Had this "borrow-and-buy" method not been put into practice, the people would not have been able to subscribe and pay in cash the vast amounts necessary. The mere "borrow-and-buy" method in itself may not have been economically sound, but with it was joined the slogan "Save," in order that the borrowings might be repaid, and the borrowing was a war necessity. Immediately after the Armistice there was an orgy of spending, prices of all commodities rose, and merchants found that they required more cash to expand and increase their inventories. This need resulted in a wide selling movement of the bonds, and was in great measure the cause of their selling temporarily below par.

*Details of the Loans.*—The Liberty Bonds and Victory Notes were issued under authority of the Acts of Congress approved April 24 1917, Sept. 24 1917, April 4 1918, July 9 1918, Sept. 24 1918 and March 3 1919, and pursuant to official Treasury Department circulars. The following are some of the details in connexion with their flotation:—The First loan was a 30-year 3½% loan dating from June 15 1917; interest payable semi-annually (as in the case of all the loans); redeemable at the option of the Government on and after June 15 1932 and exempt from all taxation, except inheritance and estate taxes, both as to principal and interest. This exemption made the First loan especially desirable for persons with large incomes and kept its market price higher than that of subsequent issues. The amount offered and issued was $2,000,000,000, the subscription $3,035,226,850. Subscriptions opened May 17 1917 and closed June 15 1917.

The Second Liberty Loan was a 4% issue dated Nov. 15 1917; maturity Nov. 15 1942 but redeemable on and after Nov. 15 1927. It was convertible into subsequent issues of bonds bearing a higher rate than 4% and was exempt from state and local taxes and from the normal income tax, but not from estate and inheritance taxes, or from the super-tax, on personal incomes or the excess and war profits taxes on corporate incomes above $5,000. Thus by increasing the interest rate and restricting the tax exemption these bonds were made more attractive to small than to large investors. Subscriptions for this Second loan began Oct. 1 and ended Oct. 27 1917. The total amount sought by the Treasury Department was $3,000,000,000, but the Secretary reserved the right to allot additional bonds up to one-half the amount of any over-subscription. Subscribers were permitted to make payment in four instalments, and this plan of allowing deferred payment to be completed in about three months was followed in subsequent campaigns. Many banks and business houses allowed their clients and employees to distribute the payments over still longer periods. The subscription was $4,617,532,300 and the issue $3,808,766,150. The Second loan was issued under the Act of Sept. 24 1917, authorizing total bonds of somewhat more than $7,000,000,000.

The Third Liberty Loan was an issue of 10-year 4¼% bonds dated May 9 1918 and not redeemable until maturity, Sept. 15 1928. The exemptions were the same as in the Second loan, but the privilege of converting these bonds into those of future issues was withheld. The amount offered was $3,000,000,000 and the Secretary reserved

the right to accept any over-subscriptions. The loan was offered to the public on April 6 1918, the first anniversary of the declaration of war by the United States, and the campaign closed May 4. These bonds were authorized under the Third Liberty Loan Act of April 4 1918, which made them available for use in the payment of estate and inheritance taxes and authorised the Secretary of the Treasury to purchase each year 5% of each outstanding issue of Liberty bonds, with the exception of the First. This provision was designed to stabilize the price of Liberty bonds in the market. The amount subscribed and issued was $4,176,516,850.

The Fourth Liberty Loan consisted of 20-year 4¼% bonds, dated Oct. 24 1918, maturing Oct. 15 1938, but redeemable after the end of 15 years. These bonds were not convertible into future issues and the exemptions from taxation were similar to those provided for the Second and Third loans, although it was provided that $30,000 of these bonds were to be exempt from surtaxes for two years after the end of the war, while an original subscriber holding this amount would also be entitled for the same period to an additional exemption as to any previous issue of 4% and 4¼% bonds to the extent of $45,000. Subscriptions to this issue, for which $6,000,000,000 was asked, began Sept. 28 and ended Oct. 19 1918. The Secretary of the Treasury accepted all over-subscriptions. The total subscription was $6,992,927,100, due to later adjustments the amount actually issued was $6,964,524,650. "The success of this largest of all loans," the Secretary said in his annual report for 1918, "was the greatest financial achievement in all history and a wonderful manifestation of the strength and purpose of the American people." The Fourth Liberty Loan Act of July 9 1918 had increased the authorization for Liberty loans from $12,000,000,000 to $20,000,000,000; it also increased the authorization for the purchase of Allied Government securities from $5,500,000,000 to $7,000,000,000.

The Victory Liberty Loan was an issue of 3- and 4-year interchangeable 3¾% and 4¼% notes dated May 20 1919 and maturing May 20 1923, but redeemable June 15 and Dec. 15 1922. The 3¾% notes were exempt from all except estate and inheritance taxes; the 4¼% notes from all except inheritance taxes, surtaxes and excess-profits taxes. The amount of the issue was $4,500,000,000 and the Secretary of the Treasury, Carter Glass, who had succeeded Mr. McAdoo, announced that over-subscriptions would not be accepted. Subscriptions began April 21 and ended May 10 1919. The amount offered was $4,498,312,650 and the subscription $5,249,908,300.

The Victory Liberty Loan Act (March 3 1919) under which the loan was floated, provided certain additional tax exemptions for holders of various issues of Liberty loans. It was calculated that the total possible exemption under these and earlier provisions was $160,000 in Liberty bonds and notes, not including the first 3½% bonds and the 3¾% Victory notes which were always exempt.

The following tables show with respect to the five U.S. war loans the quotas, subscriptions and allotments for the twelve Federal Reserve Districts of which the cities named are the Reserve banking centres. For the Third loan certain additional data are given.

*First Liberty Loan (1917)*

| District | Quota | Subscription | Allotment |
|---|---|---|---|
| Boston | $240,000,000 | $ 332,447,600 | $265,017,900 |
| New York | 600,000,000 | 1,186,788,400 | 593,987,000 |
| Philadelphia | 140,000,000 | 232,309,250 | 164,759,750 |
| Cleveland | 180,000,000 | 286,148,700 | 201,976,850 |
| Richmond | 80,000,000 | 109,737,100 | 88,593,650 |
| Atlanta | 60,000,000 | 57,878,550 | 46,283,150 |
| Chicago | 260,000,000 | 357,195,950 | 272,702,100 |
| St. Louis | 80,000,000 | 86,134,700 | 65,029,450 |
| Minneapolis | 80,000,000 | 70,255,500 | 53,759,250 |
| Kansas City | 100,000,000 | 91,758,850 | 62,182,900 |
| Dallas | 40,000,000 | 48,948,350 | 36,663,550 |
| San Francisco | 140,000,000 | 175,623,900 | 149,044,450 |
| Total | $2,000,000,000 | $3,035,226,850 | $2,000,000,000 |

More than 4,000,000 persons subscribed to this loan, and 99% of the subscriptions were from $50 to $10,000. There were 21 subscribers for $5,000,000 and over, aggregating $188,789,900.

*Second Liberty Loan (1917)*

| District | Quota | Subscription | Allotment |
|---|---|---|---|
| Boston | $300,000,000 | $ 476,950,050 | $ 407,713,700 |
| New York | 900,000,000 | 1,550,453,450 | 1,151,184,900 |
| Philadelphia | 250,000,000 | 380,350,250 | 293,127,000 |
| Cleveland | 300,000,000 | 486,106,800 | 409,787,200 |
| Richmond | 120,000,000 | 201,212,500 | 182,581,700 |
| Atlanta | 80,000,000 | 90,695,750 | 82,943,050 |
| Chicago | 420,000,000 | 585,853,350 | 525,955,600 |
| St. Louis | 120,000,000 | 184,280,750 | 150,122,200 |
| Minneapolis | 105,000,000 | 140,932,650 | 131,972,450 |
| Kansas City | 120,000,000 | 150,125,750 | 136,549,500 |
| Dallas | 75,000,000 | 77,899,850 | 74,567,100 |
| San Francisco | 210,000,000 | 292,671,150 | 260,361,750 |
| Total | $3,000,000,000 | $4,617,532,300 | $3,808,766,150 |

There were approximately 9,306,000 subscriptions to the Second loan; of this number 99% were for amounts ranging from $50 to $50,000 and aggregating $2,488,469,350.

*Third Liberty Loan (1918)*

| District | Quota | Subscription and Allotment | % of Quota | No. of Subscribers | % of Pop. |
|---|---|---|---|---|---|
| Minneapolis | $105,000,000 | $ 180,892,100 | 172·28 | 1,221,304 | 33·6 |
| Kansas City | 130,000,000 | 204,092,800 | 156·99 | 1,190,193 | 16·0 |
| St. Louis | 130,000,000 | 199,835,900 | 153·72 | 1,186,377 | 12·7 |
| Atlanta | 90,000,000 | 137,649,450 | 152·94 | 584,196 | 5·8 |
| Dallas | 80,000,000 | 116,220,650 | 145·27 | 719,210 | 12·7 |
| Philadelphia | 250,000,000 | 361,963,500 | 144·79 | 1,670,229 | 25·2 |
| Richmond | 130,000,000 | 186,259,050 | 143·27 | 858,358 | 9·2 |
| Chicago | 425,000,000 | 608,878,600 | 143·26 | 3,479,315 | 24·7 |
| Boston | 250,000,000 | 354,537,250 | 141·81 | 1,512,555 | 22·7 |
| San Francisco | 210,000,000 | 287,975,000 | 137·13 | 1,402,584 | 21·1 |
| Cleveland | 300,000,000 | 405,051,150 | 135·02 | 1,440,681 | 15·4 |
| New York | 900,000,000 | 1,115,243,650 | 123·91 | 3,043,123 | 23·2 |
| Treasury Department | | 17,917,750 | | 68,490 | |
| Total | $3,000,000,000 | $4,176,516,850 | 139·21 | 18,376,815 | 17·7 |

It will be noted with respect to this loan that the Treasury Department calculated the relative standing of the districts with regard to the amounts by which they exceeded their quotas. It should be noted, however, that this rank shifted with various loans; for example the Minneapolis district, which here stands first with a percentage of 172·28, subscribed less than its quota in the First loan, while the New York district's subscription was nearly 200% of its quota in that loan. In the Third loan bonds were allotted to the full extent of the subscriptions.

*Fourth Liberty Loan (1918)*

| District | Quota | Subscription and Allotment |
|---|---|---|
| Boston | $ 500,000,000 | $ 632,101,250 |
| New York | 1,800,000,000 | 2,044,901,750 |
| Philadelphia | 500,000,000 | 598,763,650 |
| Cleveland | 600,000,000 | 701,909,800 |
| Richmond | 280,000,000 | 352,685,200 |
| Atlanta | 192,000,000 | 217,885,200 |
| Chicago | 870,000,000 | 969,209,000 |
| St. Louis | 260,000,000 | 295,340,250 |
| Minneapolis | 210,000,000 | 242,046,050 |
| Kansas City | 260,000,000 | 295,951,450 |
| Dallas | 126,000,000 | 145,997,950 |
| San Francisco | 402,000,000 | 462,250,000 |
| Other Subscriptions | | 33,885,550 |
| Total | $6,000,000,000 | $6,992,927,100 |

As in the case of the Third loan, bonds were allotted to the full amount of the subscriptions. The number of subscribers to this loan was 22,777,680.

*Victory (Fifth) Liberty Loan (1919)*

| District | Quota | Subscription | Allotment |
|---|---|---|---|
| Boston | $ 375,000,000 | $ 425,159,950 | $ 371,910,150 |
| New York | 1,350,000,000 | 1,762,684,990 | 1,318,041,150 |
| Philadelphia | 375,000,000 | 422,756,100 | 376,290,150 |
| Cleveland | 450,000,000 | 496,750,650 | 443,802,250 |
| Richmond | 210,000,000 | 225,146,850 | 201,889,300 |
| Atlanta | 144,000,000 | 143,062,050 | 133,080,800 |
| Chicago | 652,500,000 | 772,046,550 | 694,330,000 |
| St. Louis | 195,000,000 | 210,431,950 | 201,787,600 |
| Minneapolis | 157,500,000 | 176,114,850 | 170,676,650 |
| Kansas City | 195,000,000 | 197,989,100 | 192,429,300 |
| Dallas | 94,500,000 | 87,504,250 | 84,092,500 |
| San Francisco | 301,500,000 | 319,120,800 | 294,905,950 |
| Other Subscriptions | | 11,140,308 | 6,767,800 |
| Total | $4,500,000,000 | $5,249,908,300 | $4,498,312,650 |

The total number of subscribers to this loan was 11,803,895.

In addition to the great war loans, the Treasury Department placed on sale beginning in the autumn of 1917 War Savings Certificate Stamps in two denominations, 25 cents (thrift stamps), and $5 (war savings stamps). The latter were sold at rates beginning at $4.12 each, increasing one cent monthly to $4.23 and matured in 5 years, at the end of which time the Government agreed to redeem them at $5 each, this being equivalent to 4% interest compounded quarterly. The war savings stamps were designed to be attached to a folder called War Savings Certificate, which had spaces for 20 stamps (*see* SAVINGS MOVEMENT). Treasury Savings Certificates, in denominations of $100 and $1,000, were also issued, which increased monthly in value at the same rate as the stamps. Up to June 1919 the net cash receipts from War Savings Certificates amounted to

about $950,000,000. At that time the total indebtedness of the United States was approximately $26,597,000,000, or $249.38 *per capita*, the annual debt charges being about $8.38 *per capita*. It was estimated that at the close of the war at least 20,000,000 persons, and probably as many as 25,000,000, were holders of Liberty bonds. Although complete data were not available it seemed probable that the war loans of the United States were much more widely distributed among the population than those of any other country. By an Act of March 3 1919 Congress established a cumulative sinking fund amounting to 2½% annually of the aggregate total of the loans outstanding July 1 1920, less the amount which had been invested in foreign Government securities.

For a study of the U.S. Government's financing of the war, see Jacob H. Hollander, *War Borrowing* (1919). (M. V.*)

**LICHNOWSKY, PRINCE KARL MAX VON** (1860– ), German diplomatist, was born March 8 1860 at Kreuzenort in Upper Silesia. He entered the German Foreign Office in 1884 and from 1904 to 1911 held secretarial posts in different German embassies abroad. In 1912 he was sent to London as ambassador, and remained at that post until the outbreak of the World War. He took part in the negotiations for a convention with Great Britain regarding the Bagdad railway and various colonial questions, which was on the point of being signed when the crisis of July and August 1914 became acute. Lichnowsky was convinced that for years the relations between Germany and Great Britain had been mismanaged and misunderstood by the Foreign Office in Berlin, and, in particular, he believed that Bethmann Hollweg and his advisers failed to appreciate the pacific attitude and intentions of Sir Edward Grey and the British Government during the crisis that ended in the World War. He embodied his views in the pamphlet entitled *Meine Londoner Mission*, which he circulated privately in manuscript among his German friends. This document came into the hands of a harebrained enthusiast, Capt. von Beerfelde, who was the means of its being published, without authorization, in 1917. The publication exercised a very prejudicial effect upon the German war spirit and there were loud demands among the Conservative and National Liberals for the prosecution of the author. The Prussian Upper House, of which Lichnowsky was a member, passed a resolution excluding him from that assembly. It became impossible for him to live in Germany, and he sought refuge in Switzerland.

**LIEBKNECHT, KARL** (1871–1919), German Socialist and revolutionary leader, was the son of Wilhelm Liebknecht (*see* 16.592). He was born in Aug. 1871 at Leipzig. In 1899 he qualified as a lawyer, and speedily became a prominent agitator on the extreme Left wing of the Socialist party. In 1907 he was sentenced to 18 months' imprisonment for high treason. In the following year he was elected a member of the Prussian Chamber of Deputies; in 1912 he also became a member of the Reichstag, and on the outbreak of the World War he distinguished himself by the violent opposition which he offered to the policy of the Government and the successive votes of credit. Liebknecht was then expelled from the Social Democratic party and founded a faction of his own, which he called "die Sozialdemokratische Arbeitsgemeinschaft." In 1916 he was once more arrested on a charge of high treason brought against him by the military authorities and was sentenced to four years' penal servitude. On the eve of the revolution in Oct. 1918 he was reprieved, and, on his release, at once put himself at the head of the Spartacists, the extreme revolutionary section in sympathy with Russian Bolshevism. He was once more arrested during the Spartacist insurrection in Jan. 1919, for which he was largely responsible. While he was being conveyed in a motor-car from the Government military headquarters in the west end of Berlin to the prison at Moabit he was shot down by his military escort while, as was subsequently alleged, he was attempting escape. His death, as well as that of his associate, Rosa Luxemburg, who perished on the same night at the hands of the soldiers or the mob, was constantly made a subject of reproach to the Government Socialists by the extreme Communist party.

**LIÉGE** (*see* 16.593).—The pop. of the city (not including the suburbs) had risen from 168,532 in 1904 to 172,643 in 1913 but, according to a census estimate on Dec. 31 1920, had then fallen slightly below 165,000. During the World War factories and works were sacked by the Germans and the machinery either broken up or removed, but on the declaration of peace the work of restoration was undertaken with remarkable vigour. Apart from the main iron and steel works and the manufacture of arms, industrial development has been towards the production of zinc and automobiles, thousands of hands being employed in the latter industry. Previous to the war a School of Mines, Arts and Manufactures had been established and an institute for research in electricity, the gift of Montefiore-Lévy, had been founded.

Liége was the first serious obstacle to the German invasion when they violated Belgian neutrality in 1914. Gen. Leman, the military governor, commanded the defence force. On Aug. 16 the last fort capitulated and the passage of the Meuse was forced, but only after a serious delay of eight days to the Germans and after heavy losses. The forts were repaired by Krupp in 1914–5. On the night of Aug. 20 1914, under the pretext of Gen. Kolewe, "Kommandantur," that his troops had been fired upon by Russian students, a massacre took place in the streets and 18 persons lost their lives. Many houses in the Rue des Pitteurs, the Place de l'Université, and Quai des Pêcheurs were systematically fired by the German soldiery, and order was not restored for several days. Under the occupation, the industrial workers gave proof of their independence of spirit by refusing to take part in the manufacture of weapons for use on the western front, and resisted to the utmost the deportation which took place during 1915–6. At the close of war, the Place de l'Université was re-named Place du Vingt Août to recall the scenes of Aug. 20 1914, and the Place Verte became the Place du Maréchal Foch.

See Kurth, *La Cité de Liége* (3 vols., 1909–10).

### The Siege of 1914

The importance of the fortress at the opening of the World War lay in its control of the routes from the region of Aachen to that of Maubeuge, and until these routes were in German control the assembly of the masses of the German I. and II. Army in the Belgian plain was impossible. The first phase of operations was therefore an attempt to seize Liége and these routes by an immediate *coup de main*, delivered by troops which were brought from their normal stations at peace strength without waiting for reservists to rejoin.

The fortress was a ring-fortress of about 9 miles average diameter, lying astride the Meuse and its tributaries, the Ourthe and the Vesdre. All these rivers were in deep-cut narrow valleys, which on the right bank of the Meuse lie some 350–400 ft. below the plateau level. On the left bank the country in the vicinity of the forts was more undulating than scarped, but on the side opposed to Germany the works occupied commanding eminences, but imperfectly controlled the defiles of the rivers, which, however, were in themselves highly defensible by the ordinary methods of field warfare. From the Meuse above Liége, over the Ourthe to the Vesdre valley, the country—forming the edge of the Ardennes—is heavily wooded. The northernmost forts of the ring could just reach the Dutch frontier line with their artillery. The Prussian frontier to the E. was little beyond the range of Fort Evegnée. Liége was, therefore, both an effective obstacle to manœuvre and a tempting target for surprise attack; and these contrasted characters made it difficult for the Belgian military authorities to decide in advance whether it should be considered as a stronghold to be equipped as a self-sufficing entrenched camp or only as a barrier position. In the event, it was treated as the latter.

The defences consisted of a ring of large and small self-contained forts of the well-known Brialmont type, that is, commanding concrete masses with all guns under armour, each fort being disguised to participate both in the distant and in the close defence without differentiation of the guns. In the intervals, therefore, there was no peace-time provision for the long-range batteries, and the forts themselves possessed no element corresponding to the *traditore* batteries and Bourges casemates characteristic of the "infantry" type of fort. Thus, the power

of counter-battering the enemy's siege artillery depended wholly on the strength of the armour and concrete protecting the distant-defence guns while the power of guarding the intervals, and firing into the rear of any opponent who had penetrated them, was conditional on the freedom of action of certain guns which, however, were as fully exposed to neutralizing and demolition fire as the rest. The passive strength of the fort, and practically that alone, was supposed to guarantee that the guns it protected would be available for fire in any direction on all necessary occasions, and it was therefore a fact of great importance that this strength was calculated as against attack by 21-cm. howitzers only. In Brialmont's time, and indeed at the time of the construction of the latest forts, this calibre was regarded as the heaviest available for mobile siege trains. But in 1914 this was no longer the case. Though the Germans succeeded in keeping secret the existence of their very heaviest siege guns, it was well understood that calibres above 21 cm. could figure in any modern siege, and it was known that Austria-Hungary possessed road-mobile howitzers of 30·5 cm.

Beginning from the N.E. and proceeding clockwise—*i.e.* by S. to W.—the names and positions of the forts were as follows. From the right bank of the Meuse below Liége, to the Vesdre: Fort Barchon near the Maestricht road, Fort Evegnée, Fort Fléron on the Aachen road, Fort Chaudfontaine overlooking the Vesdre valley; between the Vesdre and the Ourthe: Fort Embourg; between the Ourthe and the upper Meuse: Fort Boncelles. On the left bank of the Meuse in a semicircle from W. to N.E.: Forts Flémalle, Hollogne, Loncin, Lantin, Liers, Pontisse, the last-named crossing its fire with Barchon. The garrison commanded by Lt.-Gen. Leman consisted (originally) of the III. Army Div. reinforced by one brigade, 12 fortress battalions, 4 fortress artillery battalions, one engineer battalion, and the local *Juide Civique* equivalent in strength to rather less than a battalion. The bridge of Visé and Argenteau, N. of the fortress, was held by a detachment of the 3rd Div. The Germans brought up, for the storming attack, 6½ brigades and 5 Jäger battalions at peace strength. At this stage, the siege artillery was still in process of mobilization and it was hoped to master the fortress without it. The commander of the siege troops, designated as the "Army of the Meuse," was Lt.-Gen. v. Emmich. An important part of his task was to enable the cavalry divisions of Gen. v. der Marwitz to traverse the Meuse between Liége and the Dutch frontier, at or near Visé. The flooding of the Belgian plain, and the reconnaissance of the Belgian field army disposition by this cavalry, was in fact almost as essential a preliminary to the deployment of the German I. and II. Armies W. of the Meuse as was the capture of Liége itself. Von Emmich advanced over the frontier on Aug. 4 with the 34th reinforced Bde. and the 4th Cav. Div. on Visé; the 27th Bde. formed Fort Barchon, the 14th Bde. formed the interval Evegnée–Fléron, the 11th Bde. between Fort Fléron and the Vesdre, the 38th and 43rd Bdes. between the Vesdre and the upper Meuse (chiefly on the Ourthe), with the 9th Cav. Div. on the left rear screening the enterprise against possible interference from French cavalry in the Ardennes. Two mobile 21-cm. mortar batteries prepared to act against Barchon and Evegnée as required; and such light artillery as was available was, in the main, told off to keep the forts under neutralizing shrapnel fire. All artillery was put under cover, and in the sequel the forts were practically unable to find targets. On both sides, it is evident from what followed, nervous tension was high and uneasiness great. The Belgians in evacuating the foreground had blocked roads and blown up bridges, and the German advance, especially that of the transport, was laborious. On the 4th, owing to these obstacles, the 4th Cav. Div. reached the Meuse at Visé only very little in advance of the infantry. Finding the passage held by Belgian infantry, the cavalry forded the Meuse at Lische, just short of the Dutch frontier; the Belgians thereupon fell back on Liége, but destroyed Visé bridge before doing so. The German cavalry with the leading troops of the 27th Bde. thus spent the night of the 4th and 5th astride the Meuse, but as their troop train could not be got forward, the movement came to a standstill on the 5th. Meanwhile the other brigades advanced in their respective sectors, employing the daylight of Aug. 5 in driving back Belgian advanced troops on the various roads. After dark, the six brigades, formed in five columns, set out on the evidently desperate enterprise of storming the intervals. The procedure was practically uniform—the brigade advanced, well closed up, in fours along the road, detaching to right or left a company or two to occupy the attention of the adjacent fort by a false attack. In some columns a battery or more of field guns or field howitzers was inserted, near the head. One regiment of the 27th Bde. (which had 3) was deployed on the Barchon-Evegnée front to demonstrate and to cover the positions of the 21-cm. batteries, which themselves had the rôle of neutralizing rather than battering these forts. Of the five storming columns two were repulsed, two penetrated but then withdrew, and only one reached its objective. In all cases fighting was heavy and confused, and on the German side it was marked by very severe losses in brigade and regimental commanders. Two of the five major-generals and five colonels out of eleven were killed, a proportion perhaps never equalled in the later history of the war. A colour of the 89th Mecklenburg Regiment was captured by the Belgians. Yet by 8 A.M. on the 6th Gen. Leman had ordered the evacuation of the E. bank of the Meuse and of Liége itself, by all troops not forming part of the fort garrisons. To understand this strange result, the fortunes of the different storming columns must be followed in detail, and a brief account of the movements of each is therefore given here.

The most important sectors, from the point of view of the attack and of the defence alike, were the northern (or Fort Pontisse–lower Meuse–Fort Barchon) and the southern (or Ourthe–Fort Boncelles–upper Meuse). To each of these Von Emmich allocated two brigades, while on the eastern sector (Fort Barchon–Fort Chaudfontaine) the intervals Evegnée–Fléron and Fléron–Chaudfontaine were to be attacked by a brigade each. On the N. side, the 34th Bde. and a Jäger battalion, moving W. of the Meuse from the positions above Lische occupied on the 4th and 5th, successfully broke in between Fort Pontisse and Fort Liers, but became entangled in the dark in the villages beyond. Resistance was stiff, the brigade column broke up into four or five units attacking the discernible objectives, and the whole swerved eastward into Herstal and the area behind Fort Pontisse instead of pursuing the Liége direction. One party of Jägers reached Liége and penetrated to Leman's headquarters in broad daylight, partly through being mistaken by the inhabitants for the British troops that, rumour said, were on the way to relieve the city. After a momentary fierce fight the intruders were disarmed. The German, but not the Belgian official, account mentions also the inroad and subsequent surrender of a whole battalion of the 89th Regt. The main body of the 34th Bde. had meantime been counter-attacked in and about Herstal by part of Leman's general reserve, and had retreated in confusion to Lische, where most of the troops withdrew E. of the river. The next column, 27th Bde., moving down the Visé–Liége road, after heavy fighting carried the village of Chératte but was brought to a full stop at the next village, Wandre, and retreated to Argenteau whence it had come. Both the northern attacks were thus complete failures.

On the S. side, the 38th and 43rd Bdes. moved up in one column between Fort Boncelles and the Ourthe, detaching one battalion to demonstrate against Fort Embourg in the angle of Ourthe and Vesdre and half a battalion against Fort Boncelles. The fighting area of these brigades was the most heavily wooded and deeply scarped of the whole field, and the difficulties of the advance were increased by a thunderstorm and torrential rain. Here, too, Leman felt his position most sensitive and employed the bulk of his general reserve, so that, in sum, the Germans after penetrating as far as Oujnée and Sart Tilman, and looking down on the Meuse, withdrew again through the woods to the villages round Esneux, where meantime their baggage and rear parties had been subjected to constant attack by Belgian soldiers and civilians; for Liége, Herstal, and Sering were centres of the

arms industry and the use of firearms was familiar to all. On this front and on others, the German and the Belgian accounts alike complain of the fighting troops being fired upon from the rear. A comparison of the available items of evidence leads to the conclusion that not only did civilians participate, but that the shooting of the troops on both sides was, in the confusion of night fighting in streets and woods, frequently a wild and indiscriminate fusillade. The two brigades, after mastering this local opposition, settled down to wait for their reservists to come in from Germany. Thus the southern attack also failed on the E. side. The 11th Bde. attacked between the Vesdre and Fort Fléron, and the 14th Bde. between Ft. Fléron and Ft. Evegnée, while the 3rd Regt. of the 27th Bde. maintained its position of liaison opposite the E. side of Fort Barchon. The 11th Bde. followed the winding route from St. Hadelin by Magnée and Romsée to Beyne-Haussay behind the fort and village of Fléron. But their whole progress from locality to locality had been won by sharp fighting and it came to a standstill in the first houses of Beyne-Haussay. Thus, having no news of the column to the right, this brigade withdrew to Magnée to wait for the situation to clear up and to obtain ammunition for a renewed attack after dark, for, in spite of formal orders to employ the bayonet only, all the German columns seem to have shot away most of the contents of their pouches. Companies of the brigade remained in front of Fort Chaudfontaine and S. of Fort Fléron.

The 14th Bde., between Fléron and Evegnée, alone was successful. It moved off from Herve in the dark, branched off companies to observe Fort Evegnée, and through Micheroux advanced on the hamlet of Sur Fosse. There it was brought to a standstill with the loss of its general, the leading colonel, and many other leaders. Meanwhile, in the darkness and excitement, the rear portion of the column had lost touch with the front and became unsteady. At that moment Maj.-Gen. Ludendorff, who was watching the operations on behalf of II. Army headquarters, took command, and brought the rear troops forward. Finding the brigade commander dead, he assumed control of the column, cleared Liéry and the adjacent ground, pushed on to and captured Quene du Bois (which was attacked and defended by infantry, machine-guns and accompanying artillery), and then, daylight having come, looked around for signs of the neighbouring brigades. Nothing was seen but a column of troops on the river-road N. of Supille (actually, these were Belgians), but Ludendorff determined to push on. About midday on the 6th the column, now only 1,500 strong, seized La Chartreuse, began with its field howitzers a bombardment of the city, and pushed outposts down to the bridges. Gen. v. Emmich joined it in the afternoon.

Meantime Gen. Leman, having expended his general reserves in the struggle on the northern and southern fronts and finding himself unable for that reason to check the advance or to appreciate the strength of the column which had penetrated between Evegnée and Fléron,—believing moreover, that he had four army corps in front of him—decided shortly after 7 A.M. to withdraw all field troops W. of Liége, and to leave the eastern forts to be defended by their respective garrisons only. A little later he obtained permission from the King's headquarters to send the 3rd Div. to rejoin the field army (which was assembled on and in front of the River Jette), leaving the forts alone, garrisoned by some 4,000 men in all, to bar the passage of the Germans. In the main, the order was successfully carried out, though the troops between Ourthe and Vesdre were not notified. Forgotten by both sides, these lived in the woods for a week or more, and then escaped, not without many adventures, to Tirlemont. Gen. Leman himself chose to stay with his forts, and established his headquarters at Loncin.

Thus the Ludendorff column met with no opposition when on the 6th, after an anxious night at La Chartreuse, it entered and took possession of the city. In the course of the 6th and 7th it was joined there by the 11th and 27th Bdes. But behind it the fort garrisons were active, and, so far as normal communications were concerned, Emmich's 3½ brigades were isolated in the midst of the forts, while the other 3, outside, were engaged in receiving and incorporating their reservists. Meantime more and more troops of the II. Army were coming up, and General v. Einem was placed in immediate charge of the forces outside and in general charge of the whole. The confused situation was not cleared up even when Ludendorff returned from Liége, for next day he was unable to get in again, and the impression prevailed at Bülow's headquarters that Emmich and the forces inside had been destroyed by a counter-attack.

By the 10th, however, the situation was cleared up, and the plan of the Germans was now to emplace the super-heavy siege artillery which was becoming available so as to demolish the forts in succession, beginning with the northern forts on either side of the Meuse (Fléron, Evegnée, Barchon, Pontisse, Liers) so as to clear the way as rapidly as possible for the crossing of the congested I. Army below Liége. This was carried out systematically after the 12th; but at that date both Barchon and Evegnée had fallen to the 21-cm. mortars alone, owing to their poor concrete and to the fact of being bombarded from the rear. The remainder continued to hold out and, till ruined, to keep up an effective interdiction fire on all important cross roads, defiles, etc., although they were unable to locate the bombarding artillery. After the 12th, the German super-heavy artillery (30·5-cm. and 42-cm. howitzers) came into play. The tactics of the attack were, in general, to push infantry as close as possible to the work attacked, in readiness to seize it when "ripe for assault," to bombard steadily with 30·5- and 42-cm. and with medium long range guns till the concrete was ruined and the cupolas jammed, and to attack the gorges by means of heavy truck mortars, which here made their first appearance. To these methods there was no effective possibility of resistance. Pontisse fell on the 13th, Fléron and Liers on the 14th; Chaudfontaine and Embourg on the 13th fell to intensive bombardment by 21-cm.; Boncelles and Lantin on the 15th. On the 15th also Loncin blew up, a 42-cm. shell having penetrated to the magazine; amongst the few survivors was Gen. Leman, picked up wounded and unconscious by the Germans. The last forts, Flémalle and Hollogne, surrendered on the 16th.

The effect of the resistance of Liége on the development of the German offensive plan has been a subject of much controversy, some going so far as to deny that it had any influence thereon. Consideration of all the circumstances of time, position and intention, however, lead to the conclusion that the German failure to seize the passage on the 6th, and the subsequent resistance of the forts till Aug. 15–16, put back the deployment of the I. and II. Armies in the Belgian plain four days. This means that the grand offensive movement which began on the 18th would, but for the resistance of Liége, have begun on the 14th. Whether that resistance would have been possible had the Germans brought up their super-heavy artillery immediately after the advanced brigades, on the 6th and 7th, instead of on 10th and 11th, is another question. On this their procedure at Namur, where the artillery was installed at the very opening of the attack, is a significant commentary. The delay, whatever its causes, was of incalculable importance. (C. F. A.)

**LIGGETT, HUNTER** (1857– ), American soldier, was born at Reading, Pa., March 21 1857. He graduated from the U.S. Military Academy in 1879, was commissioned second lieutenant, and saw service in the west against the Indians. He was appointed first lieutenant in 1881 and captain 1897. On the outbreak of the Spanish-American War in 1898 he served on the staff of the adjutant-general and later was in Cuba as major of volunteers. After honourable discharge in 1899 he again entered volunteer service and was in the Philippines for two years as major. In 1902 he was appointed a major in the regular army and spent several years with the Department of the Lakes and at Ft. Leavenworth. In 1909 he was sent to study in the War College, being promoted lieutenant-colonel the same year. On graduating from the War College in 1910 he was appointed a director there and in 1913 president, in 1912 being promoted colonel and in 1913 brigadier-general. In 1914 he was on the Mexican border and from 1915 to 1917 was again in the Philippines, being for one year commander of the Department of the Philippines. In 1917

he was made major-general and commander of the Western Department but in Sept. went to France as commander of the 41st division of the A.E.F. The following year he commanded the 1st army corps and later the I. Army. He was at the second battle of the Marne, at St. Mihiel, and in the Argonne. In 1919 he was made commander of the Western Division and in 1920 commander of the IX. Corps, retiring March 21 1921.

**LIGHTING, ELECTRIC** (*see* 16.659).—Notable progress in illuminants was made during the period 1911–21. Advances in the art of applying artificial light to the best advantage have been even more remarkable, and as these apply to all illuminants they are dealt with in a separate article (*see* ILLUMINATING ENGINEERING).

*Progress in Lamps.*—Some idea of the position in regard to electric lamps at the end of 1910 may be gathered from two papers read by E. W. Marchant (*Recent Progress in Electric Lighting*, Illum. Eng. Soc., London Dec. 9 1910) and Haydn T. Harrison (*Street Lighting by Modern Electric Lamps*, Inst. of Elec. Engrs. Nov. 24 1910).

Metal filament lamps were in general use, and their advantages, in comparison with arc lamps, were already the subject of discussion; tabular data of cost are given in Maurice Solomon's work on *Electric Lamps*. The use of arc lamps with flame carbons was extending, but ordinary carbons were still widely used. Efforts were made to extend the period of burning of flame arcs before recarboning became necessary. In the magazine flame arcs carbons are automatically replaced from a stock in the lamp as they burn away. In this way a period of burning of 80–100 hours has been secured. In the Jandus Regenerative arc lamp the flame carbons were enclosed in an air-tight chamber, with a special circulatory system to prevent deposition of fumes on the globe. Approximately five c.p. (mean hemispherical) per watt and 70 hours burning with one pair of carbons were stated to be obtained. The enclosed Carbone arc was designed with a similar object, a special shape of globe being used to prevent inconvenient deposition of fumes. Quite recently a form of enclosed flame arc has been developed in Germany, the burning period being 80–120 hours, and the efficiency, on direct current 4–6 c.p. per watt (*Lichttechnik*, by L. Bloch). Inclined carbons are commonly used in flame arc lamps, but in the Crompton-Blondel arc vertical carbons, one above the other, were adopted. Marchant (*loc. cit.*) gives values ranging from 3·72 to 6·85 c.p. per watt for various flame arcs —efficiencies well above those yet attained with incandescent lamps.

Various circumstances have tended to limit the field for arc lamps. During the World War carbons were almost unobtainable, and their cost has risen considerably. Moreover, gas-filled incandescent lamps tend to displace arc lamps for many purposes. At the present time (1921) lamps using ordinary carbons are becoming obsolete, but flame arcs still hold their own for lighting large areas. Most flame arcs furnish light of a pronounced yellow colour, owing to the influence of calcium salts in their electrodes. Flame carbons yielding white light have, however, been used for photographic and cinema work. The arc lamp using a magnetite negative electrode, with a life of 150–175 hours, is still used in America but little known in England.

A step of great scientific interest has been the introduction, during the war, of searchlights using carbons cooled either by a spray of alcohol (Beck-Goerz system) or a blast of air (Sperry searchlight). (See Harrison, *Illum. Eng.* March 1918; also *Illum. Eng.* Feb. 1915; also McDowell, *Trans. Illum. Eng. Soc.*, U.S.A., Sept. 1916; also *Electrician* Feb. 2 1917). This leads to a smaller crater of increased intrinsic brightness, estimated at 200,000–300,000 candles per sq. in. as compared with 85,000 for the ordinary arc-crater. Thus, a much more powerful beam, which is stated to approach 500 million candles (max.) may be attained, and a diminished angle of dispersion. Intrinsic brilliancies of 600,000 c.p. per sq. in. are said to have been obtained in Germany (*Lichttechnik* by L. Bloch), while Lummer, with an arc operating in a pressure of 22 atmospheres and at a temperature of 7,600° Abs., attained 1,500,000 candles per sq. in.

No very striking advances in illuminants using the luminescence of metallic vapours are recorded. The tubular mercury vapour lamp has been improved by the use of devices enabling the lamp to start automatically without tilting by hand. Attempts have been made to supply the missing red rays by mounting over the tube a fluorescing rhodamine reflector, but the effect is comparatively slight.

Wolfke, in Germany, obtained an approximately white light by using an amalgam of cadmium and mercury (*Elektrot. Zeitschr.* 1912, p. 917), but the lamp does not appear to have reached a commercial stage. In the other familiar form of mercury vapour lamp with a quartz or silica glass tube, operated at a high temperature, the red and orange rays are not entirely missing. The chief feature of this lamp, apart from the higher luminous efficiency (estimated at about five c.p. per watt) is the high proportion of ultra-violet rays emitted. For ordinary lighting purposes these rays are masked by an outer globe of dense glass. Forms of lamps enabling the ultra-violet light to be applied in a concentrated form for therapeutic purposes are also available.

The Moore tube lamp, utilizing the luminescence arising from a high tension (5,000–17,000 V.) discharge through rarified nitrogen gas, is little known in England. The length of tube is usually considerable, but a small and compact form using carbon dioxide gas, the light of which is stated to resemble daylight closely in colour is used in industries involving accurate colour-matching.

The use of the rare gas neon in such luminescent tubes, announced by Claudes in 1911 (*Comptes Rendus*, May 22 1911) and since developed to a commercial stage, has had interesting results. Owing to the higher brightness and greater efficiency of luminescent neon (approx. two candles per watt) tubes of moderate dimensions and varied shape can be constructed. Such lamps can now be operated direct on 220 volts, but a special starting device, applying an inductive discharge, is necessary. The vivid orange colour of the light is favourable to its use for spectacular lighting. Quite recently small neon lamps, resembling an ordinary glow lamp in appearance and capable of being inserted in an ordinary lamp holder, were exhibited before the Illuminating Engineering Society (see *Illum. Engineer* Jan. 1921; *ibid* Aug. 1920). The cathode is extended and brought close to the anode, light appearing as a diffused orange glow. Although the efficiency is as yet low (apparently of the order of 0·06 c.p. per watt) such lamps consume only five watts or less on 220 volts. They may therefore prove useful in cases where only a weak light is necessary but a small consumption of electricity desirable. Further improvements may be anticipated.

Incandescent lamps using tungsten filaments in vacuo have now displaced the Nernst, tantalum and other forms, and the proportion of carbon filament lamps in use is constantly decreasing. The introduction in 1911 of filaments drawn out as wire from ductile tungsten has had important consequences. Filaments made by other processes (*e.g.* squirted or pasted) are now little used. The ductile tungsten wire now prepared can be more easily mounted in the bulb, can be readily wound in any desired shape, and is better able to resist shock and vibration. Ten-watt lamps are now available on 100–105 volts and 20-watt lamps on 200–210 volts, thus rendering such special devices as running lamps in series and the reduction of supply voltage by transformers largely unnecessary. Useful life and efficiency have also improved. Candle-power should not diminish by more than 20% in 1,000 hours' burning, the luminous efficiency being about 0·75–0·9 candles per watt, according to type. Filaments can be arranged in a bunched compact form suitable for automobile lamps, pocket torches, etc., and special "traction" forms, designed to withstand vibration, have been developed.

Another step of importance has been the development of the gas-filled or so-called "half-watt" lamp, announced in 1913 (see Langmuir and Orange, *Trans. Am. Inst. of Elec. Engrs. 1913; Gen. Elec. Rev.*, U.S.A. Oct., Dec. 1913; Pirani and Meyer, *Elektrot. Zeitschr.* 1915). The filament consists of a compact tungsten spiral brought to incandescence in an atmosphere of inert gas (usually nitrogen but in the smaller forms argon). The tendency of the tungsten to volatilize is checked by the pressure exerted by this envelope of gas. Filaments can accordingly be run at a higher temperature, with correspondingly improved efficiency. Recent specifications indicate that lamps should operate at 1–1·6 candles per watt with a useful life of 1,000 hours. Still higher efficiencies may be expected from high candle-power low voltage units. A feature of the lamp is the formation of convection currents within the bulb which has a long neck in which particles of tungsten tend to deposit, thus largely obviating blackening of the bulb proper. In England the smallest units available on ordinary lighting pressures are 40 watts on 100–130 volts, and 60 watts on 200–260 volts. The largest lamps ordinarily listed consume 1,500 watts. Thus we have for the first time incandescent lamps of a candle-power comparable with that of arc lamps. For special purposes even larger units have been developed. Special lighthouse lamps consuming 2,400 watts have been used in Holland, and 4,000-watt types are stated to be in course of preparation. Filaments of gas-filled lamps may assume a wide variety of shapes. In the United States special forms have been developed for use in cinema lanterns.

The "arc-incandescent" ("Pointolite") lamp, developed in the Ediswan laboratory during the war, has interesting features (*Illum. Eng.* Jan. 1916; Jan. 1920). The source of light is a globule of tungsten brought to incandescence as the anode of an arc within a sealed glass bulb. The cathode is a rod composed of tungsten and certain rare earths, which is heated by the passage of a current, ionizes the space between the electrodes and starts the arc. As an approximate "point-source," with a brightness near 13,000 candles per sq. in., the lamp is adapted for use with optical lanterns, etc. Lamps giving up to 1,000 c.p. have been developed, and it is hoped that a 4,000-c.p. type now being prepared will prove valuable for cinema lanterns in view of the steady light and the fact that no manipulation is needed once the lamp is switched on.

A feature of the past few years has been the rapid development in lamp manufacture in the United States. In 1920 the production was estimated to reach 230 million lamps, of which only 7% were of the carbon filament type (*Gen. Elec. Review*, U.S.A., Jan. 1921). Considerable progress in the manufacture of miniature lamps for automobiles, flashlights, miners' lamps, etc., is recorded, an output of 125 million being attained in 1920. Progress in lamp manufacture has been aided by success in standardizing supply voltages, nearly 79% of the lamps sold in 1920 being for the standard pressures of 110, 115 and 120 volts. In Japan a uniform pressure of 100 volts throughout the country has been established.

*Physical Data Underlying the Efficiency of Light Production.*—Researches in the physics of light production have yielded interesting conclusions, revealing the comparative inefficiency of most artificial illuminants. Thus it is estimated that the ordinary tungsten filament radiates as visible light not more than 5% of the energy imparted to it. Increasing temperature shifts the maximum of radiation nearer the visible region of the spectrum and is thus favourable to high luminous efficiency. It has been computed that a source operating at solar temperature might attain a luminous efficiency of 50%. P. G. Nutting (*Bull. Bureau of Standards*, May 1911) estimated that a source which produced only visible white light should yield 26 candles per watt, whereas the most efficient illuminants available do not give more than about five candles per watt. Nutting also calculated that a source producing only light of the most efficient wave-length for creating brightness, namely 0·54, would yield 65 candles per watt.

Our ideal should be to control emission of radiation so as to produce only light of the particular colour desired. This has a bearing on attempts made to imitate the colour of daylight. By the introduction of a suitable tinted glass in the path of light from a gas-filled lamp, or by reflecting the light from a matt surface having a suitable coloured pattern, a close resemblance to normal daylight may be obtained (*Illum. Eng.* Feb. 1920). Such "artificial daylight" units are of great value in industries where accurate colour matching is needed. But present processes involve the sacrifice of much light by absorption, and the overall efficiency of accurate units probably does not exceed about 15–20% of the light yielded by the lamp.

*Progress in Shades, Reflectors and Lighting Appliances.*—Advances in the efficiency of illuminants have been accompanied by considerable progress in methods of distributing light. Reflectors are now designed to screen the source from the eyes of persons using them, soften shadows and modify the natural distribution of light in any desired manner. Spacing rules for standard reflectors of "Extensive," "Intensive" and "Focussing" types are furnished and adherence to these should ensure the provision of uniform illumination of a specified value in foot-candles. Prismatic glass devices, for use with arc lamps and gas-filled lamps, have been designed to give a distribution of light favourable to uniform illumination between street lamps. An example is the Holophane street lighting lantern, which utilizes two prismatic glass surfaces, superimposed one on the other, with a smooth exterior and interior such that the lantern can be easily cleaned. Improved and simplified illumination photometers have enabled much information to be obtained regarding the illumination necessary for various purposes. It is now considered preferable to state the illumination in foot-candles at the actual place where light is needed rather than to prescribe so many lamps of a specified consumption per square feet. This illumination can be related to the consumption of electricity per sq. ft. of area lighted. Thus with direct lighting by vacuum tungsten lamps in modern reflectors about 0·2–0·3 watts per lumen (*i.e.* per foot-candle per sq. ft.) is usual; with gas-filled lamps about 0·1–0·15. With indirect lighting about twice of the above values are required.

The introduction of the more efficient gas-filled lamps, which require screening on account of the great brilliancy of the filament, has encouraged the use of indirect and semi-indirect methods of lighting. Small gas-filled lamps with opal glass bulbs have also been introduced. Lamps are now commonly mounted high up near the ceiling so as to be out of the direct range of vision and leave a clear space for the supervision of work. The high candle-powers available allow of greater mounting heights than those formerly used. Thus in factories lamps mounted 30 or even 40 ft. above the working plane are not unusual (see *The Gas-filled Lamp and its Effect on Illuminating Engineering* by F. W. Willcox, *Illum. Eng.* June 1919). Certain fine industrial processes, however, require local lighting with well shaded lamps. Reflectors have been developed for lighting large vertical surfaces, notably for picture lighting. A feature in the United States has been the development of "flood-lighting," *i.e.* concealed lighting by compact filament gas-filled lamps in parabolic reflectors giving a concentrated beam of light with a dispersion of 10°–15°. Thus a 500-watt lamp in a suitable mirror will yield a maximum beam-candle-power of 330,000. Such lighting units have been used for spectacular lighting (*e.g.* illuminating historic monuments and buildings, large advertisement-placards, etc.), and during the war served as a measure of protection, to prevent unauthorized persons approaching arsenals or other works unseen.

For further information the following works may be consulted:—*The Development of the Incandescent Lamp*, by G. B. Barham (1912); *Elektrische Lichteffekte*, by W. Biscan (1909); *Lichttechnik*, edited by L. Bloch, issued by the German Illuminating Engineering Society (1921); *Grundzüge der Beleuchtungstechnik* by L. Bloch (1907), translated by W. C. Clinton; *The Application of Arc Lamps to Practical Purposes*, by J. Eck (1910), *Le Nuove Lampade Elettriche ad Incandenza*, by G. Mantica (1908); *Elektrische Beleuchtung*, by B. Monasch (1907); *The Electric Lamp Industry*, by G. A. Percival (1920); *Electric Lamps*, by M. Solomon (1908); *Electric Arc Lamps*, by O. Zeidler and J. Lustgarten (1908).

Frequent articles on electric lighting appear in *The Illuminating Engineer* (London); *The Transactions of the Illuminating Eng. Society U.S.A.* (New York); and *Licht und Lampe* (Berlin). *See also* ILLUMINATING ENGINEERING. (J. S. D.)

**LIGHT RAILWAYS, MILITARY.**—To transportation engineers, both civil and military, one of the most interesting features of railway work during the World War was the development of the network of 60-cm. lines ("soixante") in rear of all the main fronts in France during the days of position warfare. These little narrow-gauge lines were, of course, no novelty, since similar lines had been employed in industrial plants, on large plantations and on large construction works. Lt.-Col. W. H. Cole, in *Light Railways at Home and Abroad* (1899), describes a 60-cm. line built under a concession granted in 1890 to the Decauville Co. between Caen and Dives. Another 60-cm. line of lighter rail (19·1 lb. to the yd., the same as the French military track) was built about the same time between Pithiviers and Toury, France. It was worked under lease by the Decauville Company. Nor was the idea new to the student of military affairs, as at the French siege manœuvres before Paris in 1894 some 30 m. of such line were laid under simulated field conditions upon which complete trains were drawn by double-ended engines. German military tests in 1895 had shown that it was practicable to lay 60-cm. (or 2-ft.) tracks, with rails weighing 10 to 19 lb. to the yd., at a rate of from 600 to 700 yd. per hour for a distance of 31 m. of continuous laying. In the campaign in Manchuria (1904–5) both belligerents had made use of light narrow-gauge lines for distribution purposes. At Port Arthur, for example, despite the fact that the main railway supply line of the Japanese army was itself of 3 ft. 6 in. gauge, equipped with medium-weight engines and light cars of small capacity (6 tons), it was found desirable to lay 60-cm. (2-ft.) track from a transfer station or siege junction to the adjacent artillery and engineer parks and thence to the siege batteries and smaller dumps near the troops. These lines of the Japanese were not suited to the use of locomotives. The sections were merely hooked together as laid. One hook was formed by a bend in an extension of the lower flange of a rail, and this engaged with a companion hook on the end of a fish plate bolted to the web of the rail of the adjoining section. At Port Arthur the sections came to the front already assembled so that no field bolts were necessary. Where transportation on mountain roads was involved, as it was in the main campaign, the rails and ties came up separately and were assembled shortly before use. At Port Arthur the light flat cars were pushed about by soldiers, at the Sha-ho by horses.

No discussion of these special railways would be complete without some reference to the "battle of the gauges," which raged around them during and subsequent to the World War (1914–8). Many officers with railway and military experience contend that the gauge of field railways should invariably correspond to that of the main supply railway—special light locomotives, and, if necessary, light cars being used on rapidly laid light rail lines. Others believe that where the main line is of 4 ft. 8½ in. gauge a lesser gauge is desirable for distribution within the combat area, but think that 60-cm. is too narrow; some have suggested 30-in., others 36-in., and so on increasing to standard, most of them agreeing, however, that when the main line is narrow, 3 ft. 6 in. or less, no lesser gauge is necessary. Others contend for the 60-cm., and these include many who have had long experience with these diminutive systems.

It is of value to examine into the purpose for which this character of equipment was intended at the outbreak of the World War. Gen. von Bernhardi, writing in 1912, had already indicated the use the Germans intended to make of them in the following words:—

"Where, during the further advance of the army, the railways are commanded by hostile fortresses or "*forts d'arrêt*," the capture

of which will probably take some time, field railways turning them must be constructed. Where the railway network is altogether insufficient to satisfy the wants of the army, or where too many difficulties are encountered in repairing the trunk lines, field railways must be laid along lines of advance from railheads. There is no occasion in these cases for being too pedantic in constructing such lines. They are not built to last for ever, and must sometimes be rapidly taken up again. At times horse power must suffice for them until time and circumstances permit the line to be constructed for steam power. Rapidity of construction is the first object. If the line to be constructed is long, we must try to begin building it at various points simultaneously. We must try to follow each corps, if possible, with one field railway line, provided material and personnel are available to build it, which of course is not the case to an unlimited extent."

Gen. von Kluck, in his book *The March on Paris*, says:—

"To assist the work of supply, a light railway system up to the several corps was successfully opened for traffic on Aug. 22 (1914); that for the II. Corps to Ninove and Vollezeel; for the IV. Corps at first to Castre, later to Enghien; and for the III. Corps to Hal."

These two quotations are sufficient to establish the fact that the Germans had adopted these lines as an essential part of the open warfare equipment of an army marching to attack, and not as an expedient for trench warfare. Experience at Metz, at Toul, and at the tunnel of Nauteuil in 1870, had impressed the minds of the German general staff with the need of some means for supplying the several corps of an army attacking an enemy army just beyond or pivoting on an obstacle on the main railway line. Doubtless they had, with their usual attention to detail, selected the 19-lb. rail, 60-cm. Decauville track, as the lightest which could accommodate the locomotives and cars necessary to forward a daily corps supply of ammunition and food for a serious engagement (about 600 tons for the German corps of 1914).

This character of service was rendered by the 60-cm. lines in the open warfare attacks by the American army in 1918. Rapidly extended for each corps, they served to free the roads and standard-gauge railway terminals from congestion by animal and motor transport, and thus gave a freedom of manœuvre for the troops engaged in breaking the hold, which the enemy insisted on maintaining, on the valleys where standard-gauge lines existed or where they could be built. For example on the American front in the attack N. from Verdun-Ste. Menehould railway, two standard-gauge lines were contemplated for the supply of the army. One of these followed the Meuse river valley to Stenay and Sedan. The enemy clung desperately to this line, and it was not until the III. Corps supplied by "soixante" forced a crossing of the river at Dun-sur-Meuse that the valley was freed and the reconstruction of the standard-gauge line could proceed. The "soixante" had given the power of manœuvre required. The second was the Aubreville–Grandpré–Mouzon line. For the attack on Verdun, the Germans had constructed a standard-gauge railway line from Mouzon to Grandpré, where it connected with a French standard-gauge railway leading to Ste. Menehould. The American plan was to build a line from Aubreville to Grandpré and thence along the German roadbed to Mouzon. Work was put under way at the beginning of the advance, Sept. 26 1918, the line being constructed as far as, and to include, a terminal at Varennes under standard-gauge railway practice. From Varennes, the "soixante" reached out to the east to supply the V. Corps. and the manœuvres of that corps and of the I. Corps on its left, supplied from Varennes and also by "soixante" from Les Islettes, freed Grandpré and opened the Aire valley for the advance of the standard-gauge railway, which from Varennes northward was constructed in accordance with light railway practice, no ballast being used, the track being supported by ties almost in juxtaposition, alternate ties extending outside of track to permit tamping and to spread the foundation. In advance of the standard-gauge track, and on the same roadbed, a "soixante" line was laid, partly of fabricated track and partly of separate rail construction, on standard ties. While this was pushed ahead of the standard line, primarily for the supply of troops, it served to speed up the construction of the standard railway by handling materials, rails, and ties in advance of standard railhead. Points of transfer from standard gauge to the "soixante" were advanced as terminals permitted and as desired, and when so advanced the "soixante" material in rear of transfer point could be taken up if needed. This was rarely done, as the line to the rear was useful.

Ever since the days of Sevastopol, students of siege warfare had insisted upon a railway for use both by the attack and defence in fortress warfare. An 18-in. gauge had been adopted for these siege railways, and 5½ m. of this track were to be carried as a part of the regular authorized store of a siege train in British practice. This equipment, including wooden sleepers but excluding cars, weighed approximately 62 tons to the m.; 25 trollies on two four-wheel bogies, weighing 54 tons, were also to be taken. The siege train included 16 pieces of artillery. For similar purposes the French had adopted a Decauville pattern track of 40-cm. gauge (16 in.). In the original conception of these hand-operated lines of from 16-in. to 18-in. gauge, the ordinary gauge of the country was to be brought to the field arsenal (siege junction), and the break of gauge between it and the narrow-gauge lines was to be made there, though it was accepted that under certain circumstances lines of wider gauge would be pushed forward to the front, even to the first batteries, independent of the break in gauge at the field arsenal. The *British Siege Artillery Drill Book* in 1898 estimated the distance of the siege arsenal at 7,000 yd. from the fortress, as being out of range of the defence guns, and this distance and the width of front to be covered by a siege unit formed the basis for the estimate upon which the 5½ m. of siege track per unit was arrived at. But increases in range, and particularly in accuracy and effectiveness of fortress guns, caused a new estimate to be made of the distance to the siege arsenal, and led to a realization that not only ammunition but other stores as well would need to be more widely dispersed, not for security alone but also for better service. Such changes increased unduly the length of haul and led to the adoption of a light line suitable for locomotives.

During the World War, after position warfare was entered upon and lines became more and more permanent, the daily wear and tear led to the replacement of light rail by heavier, the improvement of the roadbeds, the increase of ballast, the increase of loads, the connecting up of separate detached lines into systems, the installation of shops and other facilities pertaining to complete systems, and a tendency, as evinced by the action of the Americans, to adopt heavier rolling-stock and more powerful locomotives so as to secure greater tonnage per engine and train mile. Unquestionably at this period, had the design *de novo* of a railway to meet the then existing conditions arisen, most officers would have favoured a wider gauge. But when the advance began once more, the weight of a mile of track, including sleepers, came to be a vital one and the "soixante" reverted to type. Then the heavy engines and heavy cars, still very useful in bringing up materials of construction from the rear, came to be, temporarily at least, out of place on the forward lines.

In their simplest diagrammatic form the "soixante" lines ran perpendicular to the front, from stations along a standard-gauge line which roughly paralleled the front. These perpendicular lines were connected by laterals, the whole forming a series of loops, and trains were operated out on one line and back on another. The loop system permitted a density of traffic exceeding that of double track lines, and offered an alternate route if the track was broken at any point. Most of the grading was done by hand, and every effort was made to reduce earth work by following the contour of the ground even when rather sharp curves resulted. Surface location was also advantageous because it permitted a shifting of the track in repair of a break made by shell-fire. Embankments were especially to be avoided, as hand-made fills in a rainy climate meant soft track and washouts.

A most difficult problem in track construction was met with in crossing badly shell-torn ground. Old craters were half-filled with water. To level off and proceed with track-laying meant certain trouble later. Here wooden ties were used to great advantage, the fabricated track, spiked down occasionally, being frequently laid on a roadbed formed by them, the ends being supported if necessary on crib work in a manner customary in the repair of washed-out track in America.

The light railway manuals of all the Allied armies specified a depth of ballast of 6 in., extending at least 6 in. beyond the ends of ties, and noted broken stone as the most suitable material. This required about 1,000 cub. yd. of stone for each mile. Of course no such amount of material could be brought up by the line itself during rapid construction, even if it had been available in rear. Whatever was available locally was used.

Speed of construction varied greatly according to conditions. On the construction of a line between Abainville and Sorcy (28·5 km. of heavy work) it was found that 1,758 man-days were required for the construction of one mile. During the progress of this piece of work, 2·69 m. of track were built in a few minutes over half a day. The entire force engaged was 2 officers and 135 men, 2 locomotives and 2 motor-trucks. The work was in rear of a quiet sector of the American front, the conditions not being very different from those of peace. On four short tracks constructed to connect American and German 60-cm. lines after the battle of St. Mihiel (total length laid in all 19 km.), 2,012 man-days of work were required per mile. French experience indicates that this latter figure is about what is to be expected under favourable conditions. British figures vary from 1,760 to 2,400 man-days per mile. These figures may be compared with 4,300 man-days of work required in the construction of a standard-gauge line, following light-railway methods, between Varennes and Grandpré during the American Meuse–Argonne offensive.

French "soixante" track consisted of rails weighing from 15- to 19-lb. to the yard, made up into sections, 5 metres, 2½ metres and 1½ metres long, the steel ties being riveted to the rails. When riveted sections became bent or broken, they could not be repaired in the field. For this reason the Americans adopted a fabricated section, in which the ties were fastened to the rails by bolts and clips. If a section became bent or broken, the ties could be removed, the rails bent back to line and new ties substituted. The American rail weighed 25 lb. per linear yd., and came separately in 30-ft. lengths for laying on wooden ties as well as in fabricated sections. A mile of American track (fabricated sections) weighed a little over 75 tons, while a mile of track on wooden ties weighed about 90 tons, but where the wooden ties were cut in the forward area, the actual material from the rear weighed but 43 tons. The British used 20-lb. rail, and both British and Americans favoured the track made with separate rails laid on wooden ties. Fabricated track, however, was of great value in laying temporary lines and particularly in forward areas, as a damaged section could be removed and replaced in the dark and without much noise.

The German equipment track came in 10- and 19-lb. rail, but they too made much use of the separate rail, wooden tie construction. On their main arterial lines on the Verdun front a great part of the rail weighed upward of 30 lb. to the yard, a considerable amount being very heavy rail taken from standard-gauge lines which could not be operated so far forward. The Germans made wise use of the standard-gauge track and roadbed for these narrow-gauge lines. By merely moving one rail over to 60-cm. gauge, they could use the light rolling-stock and, if need came, the standard track could be promptly reëstablished. This, however, proved to be a distinct advantage to their enemies when they came to reconstruct captured lines for standard-gauge operations.

The American 60-cm. motive power consisted of 10-wheeled, 2—6—2, side-tank steam locomotives, with a weight on driving wheels of 12 tons (17·5 tons total) and 6,225 lb. tractive effort; and gasoline tractors of 0—4—0 type, weighing 7 tons and 4 tons rated at 50 and 35 H.P. respectively. By actual field tests, the pulling power of these engines on various grades was determined to be (in gross tons) as follows:—

| Compensated Grade in % | Steam Loco. | 50 H.P. Gas. Loco. | | 35 H.P. Gas. Loco. | |
|---|---|---|---|---|---|
| | | High Gear | Low Gear | High Gear | Low Gear |
| 0·0 | 258 | 62·5 | 125 | 31 | 62·5 |
| 1·0 | 133 | 32·5 | 65 | 16 | 32·0 |
| 2·0 | 86 | 21·0 | 42 | — | 21 |
| 3·0 | 61 | 15·0 | 30 | — | 15 |
| 3·5 | 54 | 13·0 | 26 | — | — |

The steam locomotive was powerful and gave valuable service on first-class track. It derailed and turned over very easily, owing to its lack of flexibility and very high centre of gravity. The French Pechot, having low centre of gravity and pivoted truck, was able to take curves with ease. It was not so powerful (tractive effort 5,060 lb.) as the American engine, but it stayed on the track. The German eight-wheeled, 0—8—0 locomotive had a total wheel base of 7 ft. 4½ in., as compared with the American 5 ft. 10 in. driving-wheel base and total wheel base of 15 ft. 7 in. It weighed approximately the same, 18 tons, but all the weight was on the drivers. There was little overhang and the centre of gravity was low. A flexible arrangement of end drivers gave radial action on curves. While not armoured, the cabs were low and well protected. The four-wheel well-tank locomotive of the Germans had a wheel base of but 3 ft. 7½ in., permitting its use on very sharp curves. The British armies used four or five types of steam locomotives. The Hunslet, 4—6—0, seemed to have given best satisfaction. The weight on drivers was 12 tons; total weight 16 tons.

Of gasoline tractors the French had several types, the principal ones being the Schneider 0—6—0, and the Crochat (petrol-electric) 0—4—4—0. The Schneider, which was equipped with a 65-H.P., 4-cylinder, 4-speed engine, compared favourably in pulling power with the steam locomotives. In part, at least, the success of this tractor was due to superior workmanship on the motor and clutch, which was of the three-disc type, and the skill of the operators. The four speeds and low centre of gravity made it suitable for work of all character. The Crochat was completely armoured. The German gasoline tractors were of two types, 0—4—0 and 0—6—0. In general construction there was little difference between them, the outstanding features of both being low construction and little side overhang. Lubrication was supplied to all moving parts from local sight feed reservoirs or from a mechanical lubricator in the cab. The planetary transmission was controlled by a hand-wheel in the cab, and the operator could apply the power gradually. No effort on his part was required to hold the power at a certain stage of engagement, as is necessary with the clutch and spring action. Simple engines, low speed, heavy fly-wheels, smooth and positive application of power, were the great points in the German tractors.

The American rolling-stock was heavier and of greater capacity than that of other armies. For long hauls on fine track this was of advantage, but the "soixante" was not intended to be a long haul, heavy-traffic railway. British cars were relatively light and flexible, but included more types than those of the other armies. The German equipment was the lightest of all. Their gondola was made by attaching removable sides and ends to a flat car. One end only of their tank car was provided with roller side-bearings enabling it to run on uneven track. The tank cars of other armies derailed frequently because of lack of flexibility between the trucks.

The "soixante" lines were operated by a simple system of telephone dispatching, adapted from the Manual Block System. The railway was divided into several dispatching districts, each controlling from 25 to 75 km. of track. Control was exercised by telephone through operators stationed along the line at intervals of from 3 to 5 kilometres. At advanced points, where night operation alone was possible, and during extensions, temporary operators equipped with portable field telephone sets kept in touch with the permanent operator next in rear or with a special dispatcher.

The general superintendent of a system was connected by telephone with all the dispatching districts, and all orders for the movement of supplies and personnel were handled through his office. He also arranged for the proper distribution of motor-power and rolling-stock among the several districts under his control in proportion to the relative traffic requirements. (G. R. S.)

*Pioneer Railways in the Middle East.*—In the World War, the development of standard-gauge lines in the western theatre was so high that "pioneer" lines were totally unnecessary. Much work was done in creating new sidings, short loops and the like, but owing to the nearness of the sources of supply, the quantity of labour available and other causes, all this work was rather accelerated normal work than pioneer building proper.

In the eastern theatre of war, too, most of the work done in Russia was rather a speeded-up development of the normal railway system than pioneer work, except in the case of the railway between Murmansk and Ivanka (Zuanka). Work on this line, however, was carried out by the civil authorities and under peace conditions and it can hardly be called a military pioneer railway.

In two theatres, however, the pioneer railways were constructed in immediate connexion with operations, and the work done in these two theatres must be considered in some detail, both as an illustration of military railway principles and as an important element in the history of the World War.

*Mesopotamia.*—In no theatre of war was the maintenance of communications so precarious a matter as in Mesopotamia. The rivers during the flood season became hardly navigable, while the constant silt deposits have not only constricted the beds but even raised them above the level of the country on either side the banks. Consequently, hundreds of square miles of land are, in spite of the protective "bunds," inundated almost every year; and railway construction is hampered or made impossible. Moreover, the climate is subject to great extremes. So intense is the heat during the months of June, July and Aug. that work has to be suspended for several hours each day; while, on the other hand, the mornings and evenings during Dec. to Feb. are so cold that the output of eastern labour is restricted. Again, it was found that, owing to the peculiar nature of the soil, unballasted surface rail-track often

became unworkable after rain. And apart from these difficulties, of course—difficulties peculiar to Mesopotamia—there was also the difficulty, common to all theatres, due to shortage of material and rolling-stock; and the strain thrown upon India was very great.

Railway construction in Mesopotamia began in the middle of 1916. Two railways were decided upon—the one, between Basra and Nasiriya, the other between Qurna and 'Amara. The Basra-Nasiriya line was built on the metre-gauge; the Qurna-'Amara line on the 2 ft. 6 in.-gauge. This question of gauge was a vital and controversial one. No definitive ruling was possible during the war, however; and the gauge of each railway in Mesopotamia was usually determined by some such consideration as the availability of material and rolling-stock. But the decision to convert the Qurna-'Amara line to metre-gauge had important effect. By the end of 1916 there were in the country three unconnected railway lines, totalling 234 m. of track. One, the Sheikh Sa'd-As Sinn line (24 m. of 2 ft. 6 in.-gauge line, opened in Oct. 1916) was built in order to maintain communication between the advanced base on the Tigris and the troops on the Kut front. It was dismantled in 1917 after the Turkish retreat. The Qurna-'Amara line (70 m. of 2 ft. 6 in.-gauge line, afterwards [April 1917] converted to metre-gauge line) was opened for traffic in Nov. 1916. It ran along the right bank of the Tigris and its principal object was to relieve the river transport on the difficult section of the Tigris between Qurna and 'Amara. Almost all the country through which the line had to pass is liable to flooding and the track had to be carried on high banks. Many bridges were also necessary, that at the Majar Kebir spill being 200 ft. wide. The Basra-Nasiriya line (the first metre-gauge line to be opened in Mesopotamia) followed the Euphrates and was 140 m. long. The rails were so laid on the sleepers (mostly of the Indian broad-gauge type) that, by shifting one rail, the line could be converted to a standard-gauge track. Much of the land through which the line had to pass was below flood level and banks had to be constructed. In addition to these three lines, a further 126 m. of track had been authorized in 1916—one line to link up Basra and Qurna, the other to connect 'Amara and Sheikh Sa'd. The latter line (the construction of which was not proceeded with owing to the rapid advance of the British forces) would have been some 86 m. long. Work on the Basra-Qurna line was begun in Feb. 1917. The principal constructional difficulty which had to be overcome was the crossing of the new channel of the Euphrates at Gurmat 'Ali. The river there is between 60 ft. and 70 ft. deep and an ordinary pile bridge was not possible. A floating bridge was brought from India and was placed in position on Dec. 26 1917. This pontoon, however, was not a great success; owing to the rise and fall of the tide the bridge could not be used more than 16 hours daily. The old channel of the Euphrates at Qurna was crossed by a pile bridge 900 ft. long.

In April 1917 the Bagdad-Samarra standard-gauge line (74 m. long)—a well-ballasted track built by the Germans in 1915—fell into British hands. The Turks, when retreating, had damaged the line—had blown up bridges and destroyed stations; but they made no attempt to demolish the track itself; and on May 6 1917 the first British train ran through from Bagdad to Samarra. In June 1918 work began on an extension of this line; and by Sept. 1 connexion between Bagdad and Tikrit was established. In Oct. work began on a further extension—from Tikrit to Shuraimiya, a distance of 30 m.; but when the line reached Baiji, 26 m. beyond Tikrit, the Armistice was signed and any further construction on the line was abandoned. The Sumaiki-Sadiya branch of this line was opened in July 1917.

After the advance beyond Bagdad in July 1917, the completion of the Kut-Bagdad line (already in course of construction) became of vital importance. This line (metre-gauge) reached Hinaidi (4 m. S. of Bagdad) on July 24 1917, the average rate of progress in construction working out at about 1½ m. per day. The line was later extended to Bagdad East, though Hinaidi remained the terminal centre. It was 109 m. long, with crossing stations at 13 points, and afforded great relief to the river traffic; for while the upstream journey from Kut occupied two days, Bagdad could be reached by rail from Kut in about eight hours.

In May 1917 work had been begun on a line from Bagdad to the Diala front. It was (owing to shortage of metre-gauge material) constructed on the 2 ft. 6 in.-gauge—material from the dismantled Sheikh Sa'd-As Sinn line and the abandoned Qurna-'Amara line being used. The line—as far as Baquba—was opened for traffic on July 13 1917. It was later extended to Table Mountain, 65 m. from Bagdad. (Between Baquba and Table Mountain, it should be added, was a branch line [4 m. long and opened at the end of 1917] connecting Abu Jezra and Abu Saida on the Diala river.) The whole of this line was afterwards converted to metre-gauge—or, more accurately, a new metre-gauge line was laid beside the existing track; the section Bagdad-Baquba being opened in Nov. 1917, and the section Baquba-Table Mountain, in June 1918. The line was originally carried over the Diala river at Baquba by a pile-and-trestle bridge. At the end of 1918, however, the pile bridge was replaced by a permanent structure, consisting of four spans of 100 ft. and two spans of 75 ft. on well piers. Towards the end of 1918, an extension of this line to Khaniqin, on the Persian frontier, was completed; later, the line was again extended—to Quretu, 130 m. from Bagdad.

In Aug. 1917 work was begun on the standard-gauge line between Bagdad and Falluja. Owing to shortage of material, however, it was not finished until the following December. One bridge—290 ft. long—had to be built over the Euphrates just outside Bagdad. After the occupation of Ramadi, at the end of Sept. 1917, it became necessary, for the support of the advancing troops, to extend the Falluja line. The original intention was to carry it to Ramadi; but it was, in practice, only extended to Dhibban, 48½ m. from Bagdad, the work being completed by Feb. 1918.

The Bagdad-Hilla line was opened for traffic in May 1918. This line was, originally, to have connected Bagdad with Musaiyib, branching from the existing standard-gauge line to Dhibban at a point 3 m. from Bagdad. Changes in the strategical situation, however, led to the abandonment of the proposed line to Musaiyib, one to Hilla being decided upon instead. The Bagdad-Hilla line—58 m. long—was built of 75-lb. rails on broad-gauge sleepers. In Aug. 1918 a 2 ft. 6 in.-line was opened from Hilla to Kifl, 21 m. away, for the purpose of carrying the harvest from the Hindiya agricultural district to Bagdad.

As the joint result of strategical requirements and the shortage of material, it was not found possible to complete the Bagdad-Basra through line until after the close of the campaign in Mesopotamia. Of the three alternative routes for the through line, that along the Euphrates was eventually decided on; and work on the connecting link between Nasiriya and Hilla was begun in Aug. 1918. The through line is on the metre-gauge; but it will undoubtedly be converted to the standard-gauge later.

It was not, as has been said, until the middle of 1916 that railway construction began in Mesopotamia. At the beginning of 1919, however,—just after the close of the campaign—the railway system in the country consisted of some 1,000 m. of track, 799 m. being main line track, and 200 m. secondary line track. Rolling stock, too, was at first extremely scarce. In July 1917, for example, only 20 standard-gauge engines and 323 standard-gauge waggons were available, together with 57 metre-gauge engines and 979 metre-gauge waggons. But by Sept. 1918 the numbers of standard-gauge engines and waggons available had increased to 38 and 562 respectively, and the numbers of metre-gauge engines and waggons to 145 and 4,158.

Inland water transport was, unquestionably, the first line of communication in Mesopotamia. It is certain however that after the advance beyond Bagdad the railways played the most vital part; and the following figures—showing the total of War Department stores (D.W. tons) carried on the principal lines in Mesopotamia during the two years 1917–8—will make clear the growth of the freight traffic service:—Basra-Nasiriya line (metre-gauge), 542,407 tons; Basra-'Amara line (metre-gauge), 699,526 tons; Kut-Bagdad line (metre-gauge), 572,696 tons; Bagdad-Baquba-Table Mountain and Qizil Robat line (metre-gauge), 403,087 tons; Bagdad-Samarra-Tikrit and Baiji line (standard-gauge), 388,934 tons; Bagdad-Falluja-Dhibban line (standard-gauge), 122,001 tons; Bagdad-Hilla line, 37,551 tons: a total of 2,766,202 tons.

*Sinai and Syria.*—The first steps towards developing a military railway system in Palestine were taken in the early part of 1916. The strategical position at the time seemed to be such as to favour a British offensive; and, as a preliminary to an offensive, certain railway construction was decided on. The doubling of the existing line from Zagazig to Ismailia was essential and, in addition, several short 2 ft. 6 in.-gauge lines on the E. bank of the Suez Canal were necessary. The Egyptian State railways undertook to carry out the work, which had to be completed by the middle of Jan. 1916. A 2 ft. 6 in.-gauge line to the Baharia oasis and a similar line to the Kharga oasis were also laid down, though not by the State railways; the necessary material being obtained by dismantling certain private lines in Egypt. In addition, since an advance into Palestine had been decided on, the construction of a line from Qantara (on the E. bank of the Suez Canal) towards Romani and El 'Arish had to be undertaken. Royal Engineer construction companies were made responsible for the actual laying of the track on this line, the preliminary formation work being carried out by Egyptian labour. A single standard-gauge line only was laid down, the question of the double line being deferred. By Aug. 1916 the line reached Romani (41 km. from Qantara); and, within a month of the British entry into El 'Arish (Dec. 21 1916), it had been extended to that place, which is 155 km. from Qantara. By mid-March 1917 the line was at Rafa, 200 km. from the base, and by June—in which month Gen. Allenby took over command of the E.E.F.—at a point (El Belah) about 13 km. from Gaza. In July the special commission on the Palestine railways, under Brig.-Gen. Stewart, recommended that, in view of the proposed further advance into Syria, the line from Qantara to Rafa should be doubled and at the end of the month the work was begun. During the subsequent advance to Jerusalem the Turkish line from Beit Hanun to Wadi Sarar was captured; and as it was practically undamaged it was, at the end of Nov.,—by which time the main line from Qantara had been extended to Beit Hanun—used for the onward conveyance of supplies. With the capture of Jerusalem (Dec. 9) the Turkish branch line from Wadi Sarar (1·05-metre gauge, like the line Beit Hanun-Wadi Sarar) came under British control and was converted to standard-gauge. Meanwhile, the work on the main line from the base at Qantara had been continued; by March 30 1918 it had been extended to a point some 8 km. N. of Ludd, and by Dec. of the same year to Haifa, 412 km. from Qantara. A branch line from Rafa to Beersheba had been completed by the

end of June 1918 and the conversion of the Turkish line—Ludd to Jerusalem—from 1·05-metre gauge to 4 ft. 8½-in. gauge was also completed. The latter formed part of the original Jaffa-Jerusalem line (completed in 1892); but the section, Jaffa-Ludd, was dismantled by the Turks. The construction of the standard-gauge line from Qantara to Haifa was a remarkable achievement. Most difficult country had to be traversed. From Qantara to Rafa there was nothing but desert; and, in the early days of the line's working, derailments were constantly occurring through the silting-up of the track by sand. Later on, however, this was avoided by covering the banks with brushwood and thorn; and when the line settled firmly on the sand formation no ballasting was necessary, the hard, closely-packed sand serving as ballast. From Rafa northward and towards Beersheba was a fertile plain, but even here the heavy growth of grass and corn on the tracks made large maintenance gangs necessary. Beyond Gaza marshy land was met with and it was found to be almost impossible to build banks during wet weather owing to the spongy nature of the cotton soil. Often, indeed, sand had to be transported to provide a bed for the track, and many culverts and drains were required to combat the effect of rain on the yielding soil. As Ludd was approached the country became hilly and heavy earthwork was necessary; and a sea wall had to be built for a considerable distance S. of Haifa. From Qantara to El 'Arish no bridges were necessary; but from El 'Arish northward wadys and streams of varying size and depth had to be crossed; and, owing to the soft nature of the soil round the wadys, scouring of the bridge foundations had to be most carefully guarded against. Trestle bridges on concrete footings were usually constructed, pile bridges being the exception; but permanent bridges were erected at El 'Arish and over the Wadi Ghuzze at Gaza, and a special swing bridge, capable of being opened in about 10 minutes, was built over the Suez Canal. Water for the use of locomotives on the main line was provided by a pipe-line system—between Qantara and El 'Arish—which was capable of supplying 600,000 gal. a day. On the recommendation of Gen. Stewart's committee in 1917, additional engines and pumps were installed at a cost of £376,000; and though in March 1918 the consumption from the pipe-line was not more than 400,000 gal. a day, it was capable of supplying something like twice that amount. The furthest points from Qantara at which water was drawn for locomotives were at kilometre 194 on the main line and Karm on the Beersheba branch line. Beyond kilometre 194 water was obtained from wells.

Some 15 R.O.D. sections (each consisting of 267 men) and four construction companies (each of 250 men), together with native labour, were employed on the Palestine railways; the construction companies being responsible for purely constructional work, and the Railway Operating Division sections for maintenance work other than sand clearing, the sand clearing being carried out by special gangs. Traffic on the Palestine system was heaviest in 1918. In that year the total of passenger traffic increased from 325,000 in the March quarter to nearly 650,000 in the Dec. quarter; the stores carried increasing from just over 300,000 tons (D.W.) in the first quarter of the year to 400,000 tons (D.W.) in the Sept. quarter.

Throughout the campaign, it should be added, the strain on the resources of the Egyptian State railways was very great. Not only did the State railways undertake much new construction work for the military authorities, but they also had to provide for a greatly increased freight and passenger traffic at a time when their rolling-stock and material were greatly depleted and when even their repair shops were being utilized for the manufacture of bombs and grenades and the repair of ordnance and machine-guns.

A full account, from the technical point of view, of the Syrian and Mesopotamian railways is to be found in the *Railway Gazette* of Sept. 21 1920. (X.)

**LILLY, WILLIAM SAMUEL** (1840–1919), English man of letters, was born at Fifehead, Dorset, July 10 1840. He was educated at Peterhouse, Cambridge, taking his degree in 1862, and subsequently entered the Indian civil service, becoming in 1869 secretary to the governor of Madras. Owing to a breakdown in health, however, he had to return to England, where he devoted himself to literature. Lilly was a convert to Roman Catholicism, and from 1874 was secretary to the Catholic Union of Great Britain. His works include *Ancient Religion and Modern Thought* (1884); *The Claims of Christianity* (1894); *Four English Humorists of the Nineteenth Century* (1895), and *Studies in Religion and Literature* (1904). He died in London Aug. 29 1919.

**LIMAN VON SANDERS, OTTO** (1855– ), Prussian general, was born Feb. 18 1855 at Stolp. After he had attained the rank of divisional commander in the German army he entered the Turkish service in 1913 for a period of five years as chief of a commission for reforming the Turkish army. He was likewise given command of the I. Turkish Army Corps, an appointment to which the Russian Government strongly objected. Liman's appointment was accordingly annulled, but he remained Inspector of the Turkish army. In Jan. 1914 he was promoted to be a Prussian general of cavalry, and in Nov. of the same year, after the outbreak of the World War, he was placed in chief command of the Turkish troops in the Caucasus. In March 1915 he took command of the V. Turkish Army on the Dardanelles, and successfully opposed the attacks of the British forces and the French contingent on the peninsula of Gallipoli. In 1918 he was given the chief command of the Turkish forces in Palestine, where he shared in the disaster which overtook them at the hands of Gen. Allenby's forces and narrowly escaped being captured. After the close of the military operations he was interned at Constantinople at the end of 1918, but was liberated in the course of the following year. He recounted his war experiences in *Fünf Jahre Türkei*.

**LINDAU, PAUL** (1839–1919), German dramatist and novelist (*see* 16.717), published in 1909 a collection of short stories *Der Held des Tages*. A volume of memoirs, under the title *Nur Erinnerungen*, appeared in 1917. He died in Berlin Jan. 31 1919. His elder brother, Rudolph Lindau, died in 1910.

**LINDLEY, NATHANIEL LINDLEY,** BARON (1828–1921), English judge (*see* 16.719), died at Norwich Dec. 9 1921.

**LINDSAY, SIR COUTTS,** 2ND BART. (1824–1913), English artist, was born Feb. 2-1824. He succeeded in 1839 by special remainder to the baronetcy of his maternal grandfather, Sir Coutts Trotter, and afterwards entered the army, where he commanded the 1st Regt. of the Italian Legion during the Crimean War. He subsequently retired from the army and devoted himself to art. Between 1862 and 1874 he exhibited many pictures, including various successful portraits, and in 1877 founded the Grosvenor Gallery, which devoted itself to exhibiting the works of the pre-Raphaelite group and other artists who were at that time considered to be too advanced in style for the Royal Academy. His first wife, whom he married in 1864, was Caroline Blanche Elizabeth, daughter of the Rt. Hon. Henry Fitzroy by his wife Hannah Mayer de Rothschild. She was herself an artist and poet of some distinction. For 30 years before her death she lived in London or Venice, gathering a circle of friends about her which included G. F. Watts, Alma-Tadema and Browning. She collected a number of fine pictures, some of which she left to the National Gallery. She published several volumes of verse, among them *From a Venetian Balcony* (1903) and *Poems of Love and Death* (1907). She died in London Aug. 10 1912. Sir Coutts Lindsay married secondly, in 1912, Kate Harriet Madley, daughter of William Burfield. He died at Kingston May 7 1913, the baronetcy becoming extinct.

**LINDSAY, [NICHOLAS] VACHEL** (1879– ), American writer, was born at Springfield, Ill., Nov. 10 1879. In 1897 he entered Hiram College, O., but left after three years to study art in Chicago and New York. For several winters he was a Y.M.C.A. lecturer, and during 1909–10 lectured for the Anti-Saloon League in his native state. Meanwhile he had begun during the summers a series of wanderings on foot which carried him through many states, reciting or singing his own verses like an ancient minstrel, and delivering an occasional lecture, receiving in return food and lodging. In 1920 he visited England, where he gave recitals. Many of his poems have the true ballad ring.

He wrote *General William Booth Enters into Heaven, and Other Poems* (1913); *The Congo, and Other Poems* (1914); *Adventures While Preaching the Gospel of Beauty* (1914, prose); *The Art of the Moving Picture* (1915, prose); *A Handy Guide for Beggars* (1916, prose); *The Chinese Nightingale, and Other Poems* (1917); *The Golden Book of Springfield* (1920, prose) and *The Golden Whales of California, and Other Rhymes in the American Language* (1920).

**LINSINGEN, ALEXANDER VON** (1850– ), Prussian general, was born on Feb. 10 1850 at Hildesheim. From 1909 to 1914, he was in command of the II. Army Corps, and in Jan. 1915 was given the command of the German Southern Army, which he exchanged in July of the same year for the command of the Army of the Bug. In the following Sept. the German-Austrian south-eastern group (Army Group L) was likewise placed under his command. With these forces he succeeded in repelling Russian attempts to break through in Oct. and Nov. 1915, and in 1916 and 1917. He was in command at the battle of Gartorysk

on Oct. 8 when the German-Austrian troops captured the Russian positions, while the operations which the Russians initiated nine days later resulted in their breaking the Austro-German front on Oct. 20. In March 1918 Linsingen led the advance into the Ukraine, and was advanced to the rank of Generaloberst. In the following June he was appointed chief-in-command in the Mark, *i.e.* in the province of Brandenburg including Berlin. In this capacity he was responsible for the disposition of the troops which had been left in Berlin and neighbouring garrisons for the purpose of preserving order. On the eve of the revolution he and the officers in command under him failed to maintain their authority, and, on Nov. 9 1918, the troops made common cause with the revolutionary workmen, who overthrew the imperial and royal régime and secured the proclamation of the German Republic.

**LINTON, SIR JAMES DRUMGOLE** (1840–1916), British painter, was born in London Dec. 26 1840. He was educated at Cleveland House, Barnes, and afterwards studied art. He frequently exhibited his works and was best known as a water-colour painter. From 1884 to 1899 he was president of the Royal Institute of Painters in Water Colours, and was again elected in 1909, holding the office till his death. He was knighted in 1885. He died at Hampstead Oct. 3 1916.

**LIQUOR LAWS AND LIQUOR CONTROL** (*see* 16.759).—In the following article, the later developments on this subject are dealt with as regards the United Kingdom and the United States, but the article PROHIBITION should also be consulted in this connexion, especially as concerns the United States.

UNITED KINGDOM

1. *Pre-War Legislation.*—Two legislative enactments relating to the sale of intoxicating liquors in the United Kingdom are to be recorded respecting the four years from 1910 to the beginning of the World War.

(*a*) The Licensing (Consolidation) Act of 1910 codified the greater part of the existing licensing laws of England and Wales. The changes introduced by this Act were few and of minor importance. It was designed to bring within one code the complex legislation outlined in 16.763–4. This Act remained the statute law at the opening of 1921, although during the period 1915–21 it was superseded, in many of its main provisions, by the Orders of the Central Control Board (Liquor Traffic); (*b*) The Temperance (Scotland) Act, 1913, appointed 10 A.M. as the opening hour for licensed premises throughout Scotland; strengthened the law respecting clubs supplying liquor; and gave powers of Local Option to Scottish Local Government electors on the three resolutions of "no licence," "limitation of licences by one-fourth," and "no change." Under the terms of this Act, the first local option polls were taken in Scotland in 1920 (*see* SCOTLAND).

2. *Emergency Legislation in 1914.*—The necessity for more stringent measures of control over the sale of drink was manifest in the opening days of the war. Insobriety in the services was too obvious a peril to be disregarded. Steps were at once taken under the first Defence of the Realm Act (Aug. 1914). Competent naval and military authorities were empowered to reduce hours of sale, and, in cases of emergency, to close licensed premises in naval and military areas; the supply (except under doctor's orders) of intoxicants to sailors or soldiers undergoing hospital treatment was prohibited; as was also the bringing of liquor into dock premises used for naval or military purposes. Nearly 500 restrictive orders were made by service authorities during the first ten months of the war. But the question was speedily recognized to be one affecting civilians as well as service men. The Intoxicating Liquor (Temporary Restriction) Act, passed on the last day of Aug. 1914, and intended to apply to the conditions of civil life, was asked for by the service authorities. It gave licensing justices power, upon the recommendation of the chief officer of police, to vary within narrow limits the opening and closing hours of sale. The Act applied also to the supply of liquor in clubs. The ground for action was "the maintenance of order, or the suppression of drunkenness." Within four months restrictive orders were made in 427 out of the 1,000 licensing districts in England and Wales.

3. *The Demand for Further Action.*—As the growth of the army and munition industries drew the vast majority of the adult population into national work, spread camps and munitions works throughout the kingdom, and made efficiency the national watchword, the need for much more drastic action was realized. Lord Kitchener in Oct. 1914, and Lord Roberts a few weeks later, appealed to the public to avoid treating men of the new armies to drink. Sir Edward Henry, the chief commissioner of police for the metropolis, called attention "to the serious difficulties with which the military authorities are at present faced owing to the late hours to which the numerous public houses are kept open." The chairman of the Birmingham justices, announcing an order under the Intoxicating Liquor (Temporary Restriction) Act, said, "the order has been made owing to the accumulated evidence in the hands of the authorities as to the delay in the execution of Government orders, arising from the bad time-keeping and drinking habits of a minority of the workmen employed on such orders." On March 29 1915, a deputation from the Shipbuilding Employers' Federation waited on the Chancellor of the Exchequer to urge "the total prohibition during the period of the war of the sale of exciseable liquors," basing their claim on serious delays in shipbuilding and repairs. The statement of delays submitted by the deputation was forwarded to the King, who, resting his action on the evidence thus furnished, "set the example by giving up all alcoholic liquor himself, and issuing orders against its consumption in the Royal Household, so that no difference should be made, so far as His Majesty is concerned, between the treatment of rich and poor in this question." The Royal example stirred public thought, yet it was seen ere long that only new legislation could effectively meet national requirements. A speech by Mr. Lloyd George at Bangor on Feb. 28 1915 riveted public attention. The "lure of drink," he affirmed, was delaying the output and transport of stores of war. This was true of only a minority of manual workers, but "a small minority of workmen can throw a whole works out of gear." There was an extraordinary consensus of opinion in favour of entrusting the Government with whatever new legislative powers they deemed requisite. Possible remedies for the impairment of efficiency by alcoholism were widely canvassed. These included total prohibition; the prohibition of spirits; the sale of light instead of heavy liquors; a general restriction of drinking facilities; State purchase, to be followed by drastic curtailment of the traffic in drink; and the provision of works' canteens to supply wholesome meals for war workers.

4. *Control Board (Liquor Traffic).*—When the Government plan was announced in the Commons, on April 29, it was seen that neither prohibition nor national purchase was to be adopted. "Control" was the key-word of the policy. A new national authority was to be established, with unprecedented powers. It was further proposed to increase substantially the taxes on intoxicating liquors. The fiscal plan, devised partly to aid revenue and partly to promote sobriety, did not survive hostile Parliamentary criticism. But the "control" proposals, supported by a White Paper "showing the effects of excessive drinking on the output of work on shipbuilding, repairs and munitions of war," were approved by Parliament as the Defence of the Realm (Amendment) (No. 3) Act. The new authority, entitled the Central Control Board (Liquor Traffic), was set up on May 27. The Board, as finally constituted, comprised representatives of the Admiralty, War Office, Home Office and Treasury Departments; men expert in licensing law and public health administration; well-known employers and Labour leaders; and leaders of the temperance movement and liquor trade. Lord D'Abernon served with great distinction as chairman for five years (1915–20). Sir John Baird was appointed chairman in May 1921; in the year preceding his appointment the acting chairman was Sir John Pedder. The secretary of the Board was Sir John Sykes. By the death of Mr. Richard Cross in 1916, the Board lost a member of unusual vigour of mind and long experience in licensing administration.

The Board could take action where, and only where, war material was being made or loaded or unloaded or dealt with in transit, or where men belonging to H.M. naval or military

forces were assembled. Action must be "for the purpose of increasing directly or indirectly the efficiency of labour in such areas, and preventing the efficiency of labour in such areas from being impaired by drunkenness, alcoholism, or excess." It would be a mistake, therefore, to regard the Board's work as a designed contribution to temperance reform. Conversely, the fact that the vast experiment which the Board made in modes of liquor control was entered upon without bias, and dictated solely by concern for the industrial efficiency of the nation, gives it a unique public value.

The first areas were scheduled and restrictions applied in July–Aug. 1915. These areas included most of the seaports of England, Wales and Scotland, for it was speedily established that the intemperance of a minority of ship and shore workers had caused delay in the sailing of vessels laden with stores of war. Restrictive orders for London and the great industrial neighbourhoods of the Midlands and the North followed. Ultimately, the Board's orders came to apply to all the main manufacturing and transport areas; the only parts of Great Britain excluded were certain agricultural districts, and a few of the smaller towns where military orders restricting the sale of drink made action by the Board unnecessary. The procedure was normally this: complaints that drink was delaying war work or efficiency in the services were received from the Ministry of Munitions, the service authorities, or other responsible quarters; a delegation of members of the Board, appointed for the purpose, held a one or two days' conference in the neighbourhood concerned, taking evidence from naval, military, licensing and municipal representatives, the chief constables, employers and trades unionists, deputations from churches and temperance societies, and from the various sections of the local liquor trade; the delegation's report was considered by the Board; where action was found necessary, a restrictive order was prepared to apply to a definite area, usually an extensive one; a statement of the case for action in the area suggested was submitted to the Minister of Munitions; when the area had been defined by an Order in Council an Order was issued by the Board to take effect therein about ten days later. In the areas so defined, the Board was able, during the war emergency period, to vary the restrictions in force, to provide or encourage the provision of industrial canteens for war workers, or to exercise their power to acquire licensed property by purchase and thus directly control the sale of drink.

5. *Methods of Liquor Control.* (*A*) *The Restrictive Code of the Board.*—The most notable changes made by the Board in the hours and customs of liquor sale are summarized below. The main lines of policy were found applicable to all the scheduled areas, but minor deviations were made to meet the requests of naval or military authorities, or the special circumstances of localities. The "Standard Order" comprised the following important divergences from statute law or popular custom:—

(1) Weekday hours for "on" sale (*i.e.* for consumption *on* the premises). England and Wales: hours reduced by two-thirds; from 19½ (London), 17 (large towns), and 16 (other places) to a maximum of 5½, divided between the mid-day and evening meal-time periods; no sale before noon; sale for 2½ hours at mid-day (12–2:30 P.M.); period of non-sale until 6 or 6:30 P.M.; sale resumed for three hours in the evening, ceasing at 9 or 9:30 P.M. Scotland: hours reduced from 12 to a maximum of 5½, divided into mid-day and evening meal-time periods, as in England; a special provision for the industrial areas of the Lowlands and North prohibited sale on Saturdays (the usual pay day) until 4 P.M., sale to continue until 9 P.M.

(2) Sunday hours for "on" sale. England: hours reduced from seven to five. In Wales and Scotland, where a Sunday closing law prohibited ordinary sale or supply from licensed premises, the Board's order brought clubs within the prohibition. In Monmouthshire and the Forest of Dean complete Sunday closing enforced, in keeping with the practice in the adjoining Welsh counties from which there had been a considerable Sunday incursion of drinkers.

(3) Hours for "off" sale, *i.e.*, for consumption *off* the premises. "Off" sale and dispatch of brewed liquors, and wines, ceased one hour earlier at night than "on" sale. "Off" sale and dispatch of spirits (save to meet medical emergencies) limited to the permitted mid-day hours (12–2:30 P.M.) from Monday to Friday, and no "off" sale on Saturday or Sunday. No "off" sale of spirits from railway refreshment rooms.

(4) Additional restrictions on spirits, because of their greater alcoholic strength. Before the war, whisky, brandy and rum might not be diluted, without notice to the purchaser, to a lower strength than 25° under proof; the Board extended this limit to 50° and made dilution to 30° compulsory. To stop the trade in "nips" and small flasks of spirits, the "off" sale of a less quantity of spirits than "a reputed quart" prohibited.

(5) Treating prohibited, to stop the general and pernicious practice of pressing liquor on men in uniform, and the habit of "group drinking" among workmen, a custom to which a considerable amount of intemperance was due. (A "saving provision" permitted treating to liquor as part of a meal.)

(6) The "long-pull," or over-measure of beer, given by a publican to draw trade to his house, prohibited.

(7) Retail sale of liquor on credit prohibited, to stop the practice of running into debt for drink.

(8) Canvassing for liquor orders, elsewhere than on licensed premises, prohibited.

(9) In view of the fact that before the war clubs supplying liquor were not required to conform to the same restrictions as licensed premises, and could supply drink at any hour, it is important to note that the whole code of the Board's restrictions applied to clubs not less than to all classes of licensed premises.

When informed of police-court convictions showing that the restrictive order had been disregarded and the public interest imperilled, the Board was empowered, after due enquiry, to stop the sale or supply of drink in the licensed premises or club concerned for the remainder of the current licensing year. This step was taken in regard to 178 licensed premises and four registered clubs.

In two Scottish neighbourhoods of outstanding naval importance, Glasgow Docks and the Firth of Forth, the Board supplemented the restrictive order by a system of direct supervision, appointing a "supervisor" to assure compliance with the restrictions and to recommend further action as required.

(*B*) *The Industrial Canteen Movement.*—The Home Office investigators, whose reports were included in the White Paper of 1915 mentioned above, stated that in the shipbuilding areas "many of the workmen take insufficient food, which not only increases the temptation to drink, but makes the effect of the liquor taken more injurious, so that the result is to incapacitate the workmen for the strain of heavy work." They emphasized "the need for mess-rooms and canteens in the yards where the men could get good meals in comfort without having to resort to the public houses." "Such accommodation," they said, "is very rarely provided." The need was even more obvious in the munition areas. The answer of the Board was a widespread development of industrial canteens, ranging from the simplest of mess-rooms to "social centres" with extensive recreative as well as culinary provision. A canteen committee under the chairmanship of Sir George Newman was set up to direct the enterprise. Employers were encouraged to erect canteens under a scheme which permitted them to deduct a proportion of the cost from the sum which would otherwise have been payable to the state as "excess profits." Between 800 and 900 canteens were thus provided for over a million employees in transport or munition areas. Over 95% of the canteens were "dry"; where intoxicating liquor was retailed, the supply per person was restricted to one pint of beer served with a meal. The sale of "light beer" of a non-intoxicating strength was encouraged. The Health of Munition Workers' Committee attributed to this industrial canteen movement the improved nutrition of the workers in the industrial establishments affected, increased contentment and efficiency, and "a lessened tendency to excessive consumption of alcohol."

(*C*) *The Direct-Control Areas.*—In three neighbourhoods of supreme importance to the nation at war the Board acquired the licensed premises, and carried on the trade in intoxicants under a stringent control. A group of licensed premises adjacent to the Royal Small Arms Factory at Enfield Lock, N. London, was purchased in Jan. 1916. All the licensed premises in a wide area around the Cromarty Firth were acquired in 1916–8 to enable the Board to repress intemperance at the then base of the Grand Fleet, which at a later date became a base for American naval forces. The largest State Purchase enterprise, and the most famous, was on the Scottish Border, where a huge national explosive factory was erected, surrounded by the new township of Gretna.

Table I shows the number of licensed premises acquired in the three State Purchase areas (from 1916 to 1921), and the number of these licences suppressed after purchase as redundant.

TABLE I.—*Licensed Premises Acquired in the Direct-Control Areas.*

| Area | Breweries | "On" licences | "Off" licences | Total retail licences acquired | Retail licences suppressed after purchase because redundant |
|---|---|---|---|---|---|
| Enfield . . | — | 4 | 1 | 5 | — |
| Cromarty Firth Area . . | — | 28 | 11 | 39 | 19 |
| Scottish Border Area, Gretna (including Annan) . . | — | 20 | 8 | 28 | 16 |
| Carlisle (city) . | 4 | 104 | 12 | 116 | 50 |
| Carlisle (adjacent country districts) . | 1 | 196 | 2 | 198 | 67 |
| Total . | 5 | 352 | 34 | 386 | 152 |

The rapid influx of a new industrial population overwhelmed the normal social life of Carlisle and district. Sixteen thousand navvies were at work at Gretna. The available housing accommodation proved inadequate, and the public houses were packed to excess. "Broken time" at Gretna became a matter of grave concern; of 953 persons convicted for drunkenness in 1916 at Carlisle 788 were Gretna factory workers. The Board's restrictive code had been applied but was extremely difficult to enforce; the abnormal conditions demanded changes more fundamental. Consultations with the local authorities led to the decision to purchase the licensed properties throughout the area, and to institute under State ownership a firmer control of the traffic in intoxicants. The houses first acquired were those adjacent to the national factory; but the problem was speedily seen to be co-extensive with the district over which the industrial workers had spread, and in successive stages the purchase area was extended to a territory of 500 sq. m., flanking both shores of the Solway Firth, with a war-time pop. of 140,000, including the towns of Annan and Gretna in Dumfriesshire, and the city of Carlisle and the town of Maryport in Cumberland. The properties acquired in this Border area numbered five breweries and 342 licensed premises (320 "on," 22 "off" licences). Local advisory committees were set up at Carlisle and Gretna to coöperate with the Board in the work of administration. Sir Edgar Sanders, as general manager of the Carlisle undertaking, rendered unique national service.

The chief changes effected under the State Purchase régime at Carlisle, over and above the Board's usual restrictive code, were these:—

(1) A vast improvement was speedily achieved in the observance of the restrictive code. (2) Redundant and undesirable licences were extinguished; up to June 1921 133 licensed premises were closed, and brewing discontinued at three of the five breweries; all "grocers' licences" were extinguished as soon as purchased. (3) The sale of spirits was stringently regulated. The number of houses selling spirits for "off" consumption was greatly reduced, and throughout the war no sale of spirits ("on" or "off") was permitted on Saturdays. (4) The "on" sale of intoxicants to young persons under 18 was prohibited, excepting the sale of beer with a meal. (5) All display of liquor advertisements outside licensed premises ceased. (6) During the war complete Sunday closing was enforced in the State Purchase area of Cumberland to accord with the practice north of the Border. (7) Certain licensed premises were reconstructed and structural improvements made in others. (8) All private interests in the sale of intoxicants were eliminated, and a weekly wage paid to bar employees irrespective of the quantity of liquor sold. (9) The sale of food and non-alcoholic refreshments was encouraged, and a commission on these paid to the managers of licensed houses. "Food taverns" were established in industrial neighbourhoods, and tea-rooms provided at country inns. In 1920 570,000 meals were served in the Board's "food taverns" at Carlisle. (10) Licensed restaurants with ample recreative facilities were opened at Carlisle, Longtown and Aanan. (11) Provision was made at Carlisle for the meeting of Trades Union Branches and Friendly Societies on unlicensed premises. (12) Substantial economies in the manufacture and sale of liquor were secured as a result of the acquirement of many competing businesses by one organization.

The social results of this new system of administration were seen in a rapid decrease of drunkenness, and a marked improvement alike in public order and in industrial efficiency at the neighbouring national factory. The annual reports of the chief constable of Carlisle testify to the reduction of insobriety. A convincing proof of the social value of the policy of direct control in the Scottish section of the Border area was an official request to the Board from the local authorities of Dumfriesshire asking that the whole of the county should be included in the State Purchase area. Similarly valuable social results were achieved at Enfield and in the Cromarty Firth area.

The value of the assets of the Board's direct-control undertakings—in the Carlisle and Gretna, Cromarty Firth, and Enfield areas—amounted at March 31 1920 to £1,307,448; while the balance of Exchequer issues outstanding, after crediting interest amounting to £89,058, was £646,939; and the accumulated profits amounted to £435,335. The direct-control undertakings had at that date been in existence for about four years, and as the current annual profits were sufficient, after allowing for Exchequer interest, to admit of the Exchequer issues being repaid at the rate of £120,000 per annum, it was possible that the whole capital expenditure would be repaid with interest in about ten years from the commencement of operations.

(*D*) *Investigation of the Effects of Alcoholic Beverages.*—Early in the Board's career it was found essential to obtain reliable data concerning "the physiological action of alcohol, and, more particularly, the effects on health and industrial efficiency produced by the consumption of beverages of various alcoholic strengths." An advisory committee for this purpose was formed under the chairmanship of Lord D'Abernon, and their successive reports on the nature and action of alcohol were ultimately published under the title of *Alcohol: its Action on the Human Organism.* The impartial spirit of this volume, and the representative character of the distinguished men of science who served upon the advisory committee, combine to make the volume the standard authority upon the field which it covers.

6. *The Food Controller's Limitation of Output.*—Within the period under review another series of drastic restrictions on the liquor trade is to be recorded, a limitation of brewing and of the release of spirits and wines from bond. The Output of Beer (Restriction) Act, 1916, caused some reduction in the output of beer; but it was the activity of German submarines in the third year of the war which, by endangering the national food supplies, led to the policy of severe limitation of liquor output adopted by the Food Controller in the early months of 1917. On April 1 1917, brewing was restricted to an output of 10,000,000 standard barrels per annum, compared with 36,000,000 standard barrels, the output for the year ending March 31 1914; and the quantity of spirits and wines to be released from bond was limited by one half. This policy of restriction of output was maintained for three years in varying degrees of stringency. After the Armistice, successive relaxations were made, and the restrictions on output were finally withdrawn in July 1919. The permitted average gravity of beer, and the retail prices of beers and spirits, were fixed by a series of Orders of the Food Controller; this system of control was continued until the passage of the Licensing Act in Aug. 1921.

7. *Effects of the Policy of Liquor Control.*—The relevant statistics point to a remarkable decrease in drunkenness, and in the disease and tragedies which follow alcoholic indulgence. The appended table displays, for the period 1913–20, the number of recorded convictions for drunkenness, deaths from alcoholism and from cirrhosis of the liver, a disease often attribut-

TABLE II.—*Drunkenness and other Alcoholic Phenomena in England and Wales 1913–20.*

| | Convictions for Drunkenness | | | Recorded Deaths from Alcoholism | Recorded Deaths from Cirrhosis of the Liver | Recorded Deaths from Suffocation (Children under one year) | As [illegible] Suicide |
|---|---|---|---|---|---|---|---|
| | Males | Females | Total | | | | |
| 1913 | 153,112 | 35,765 | 188,877 | 1,831 | 3,850 | 1,226 | 1,426 |
| 1914 | 146,517 | 37,311 | 183,828 | 1,816 | 3,999 | 1,233 | 1,385 |
| 1915 | 102,600 | 33,011 | 135,611 | 1,451 | 3,632 | 1,068 | 1,000 |
| 1916 | 62,946 | 21,245 | 84,191 | 933 | 2,986 | 794 | 945 |
| 1917 | 34,103 | 12,307 | 46,410 | 580 | 2,283 | 794 | 935 |
| 1918 | 21,853 | 7,222 | 29,075 | 296 | 1,671 | 557 | 810 |
| 1919 | 46,767 | 11,180 | 57,947 | 369 | 1,567 | 525 | 1,228 |
| 1920 | 80,517 | 15,246 | 95,763 | 591 | 1,763 | 593 | 1,418 |

able to alcoholic indulgence, deaths of children (under one year of age) from suffocation, and cases of attempted suicide. The figures refer to England and Wales. 1913, as the year immediately preceding the outbreak of war, is taken as a pre-war standard. The influence of the restrictions can be clearly traced. The convictions of males for drunkenness show an enormous decrease from 1915 to the close of the war, but the transfer of millions of men from civil to military discipline makes it difficult to determine the part in this reduction which is properly attributable to the new drink policy. Students of the problem have accordingly turned to the statistics for drunkenness among women as a much more reliable index. In comparison with 1913, the convictions of females for drunkenness increased in 1914 by 4%, an indication of what was likeliest to happen as a result of the tension among women whose male relatives were serving with the forces. The influence of the restrictions is reflected in the figures for 1915. Repeated experience shows that in Great Britain the curves of spending power and convictions for drunkenness normally rise together; yet, notwithstanding the great increase in the spending power of women due to the fact that from 1915 to 1918 women were engaged in national industries in very large numbers, and so became regular wage earners, convictions for drunkenness among females actually decreased in 1915 by 7%; in 1916 by 41%; in 1917 by 66%; in 1918 by 80%. The group of "vital statistics" which follows supplies confirmatory evidence. The deaths certified as due to or connected with alcoholism, in comparison with 1913, declined in 1915 by 20%; in 1916 by 48%; in 1917 by 68%; in 1918 by 83%. The deaths certified as due to cirrhosis of the liver, in comparison with 1913, declined in 1915 by 6%; in 1916 by 23%; in 1917 by 41%; in 1918 by 57%. The deaths of children under one year from "overlying" (a form of mortality frequently attributable to parental drunkenness), in comparison with 1913, declined in 1915 by 16%; in 1916 by 39%; in 1917 by 42%; in 1918 by 54%. "The suicidal impulse is the most frequent and most characteristic of the graver disorders of conduct to which the habitual drunkard is prone" (Sullivan); the recorded cases of attempted suicide, in comparison with 1913, declined in 1915 by 33%; in 1916 by 61%; in 1917 by 62%; in 1918 by 67%.

In estimating the significance of these statistics it should be borne in mind that from the autumn of 1915 to the spring of 1917 the Control Board's restrictive code was applied stage by stage to a territory equalling five-sixths of Great Britain, peopled by nineteen-twentieths of the population; and that, in the later months of 1917 and throughout 1918, the Food Controller's restrictions on output were operating side by side with the Board's restrictions on hours and customs of sale. It will be noted that in 1919 and 1920, years marked by some relaxations of the Board's restrictions, and a progressive diminution leading on to complete revocation of the Food Controller's limitation of liquor output, there was a very considerable increase in convictions for drunkenness, and the curve of mortality began to move upwards again.

Apart from statistics, a mass of valuable evidence exists to show that the Board's restrictions led directly to an increase of discipline and health in the services, and a very marked improvement in efficiency in munition and transport industries. Numerous testimonies from the Admiralty and War Office, and from large employers of labour are cited in successive reports of the Board. Chief constables in all parts of the country noted in their annual reports a wonderful improvement in public order. The commissioners of prisons in successive reports pointed to the restrictive Orders as an influential cause in the reduction of crime. Hospital authorities recorded a diminution in street accidents and injuries arising from street brawls. Health visitors testified to the domestic advantages and gains to child welfare which were manifest as soon as the shorter hours for the sale of drink came into force. A mass of evidence respecting the bearing of the restrictive code on industrial and social life, and an examination of the available statistical data, will be found in *The Control of the Drink Trade* by Henry Carter (2nd ed., pp. 237–281).

8. *Changes in Liquor Taxation.*—There were large increases in liquor taxation in the later years of the period under review. At the outbreak of war the duty on beer was 7s. 9d. per standard barrel; on spirits 14s. 9d. per proof gallon. The beer duty was raised to 23s. per standard barrel in Nov. 1914; to 25s. in 1917; to 50s. in 1918; to 70s. in 1919; and to 100s. in 1920. The duty on spirits was raised to 30s. per proof gal. in 1918; to 50s. in 1919; to 70s. in 1920. The Finance Act (1920) practically doubled the pre-war import duties on wines. These heavy increases in liquor duties, which led to corresponding increases in the retail prices of liquor, doubtless had a considerable influence in checking the consumption of liquor in the years immediately following the war.

9. *The Close of the Period of Control.*—The beneficial results of the policy of liquor control were widely recognized, and it was commonly expected that the Government would at an early date, when dissolving the Board, enact new legislation based on the experience gained through what the *Scotsman* had described as "the largest social experiment of our time." The Government were, however, pre-occupied with the terms of world peace. In Nov. 1919 the Prime Minister told a deputation from the Temperance Council of the Christian Churches that a bill dealing comprehensively with the subject "would be introduced before Christmas." No bill was introduced. The King's Speech in 1919 renewed the promise of legislation. In Nov. 1920 a bill was introduced which would have transferred for a limited period the powers and properties of the Board to the Home Office, but the bill did not survive the criticism directed against what was deemed to be a perpetuation of war emergency "control." The Board made various modifications in their code, to meet in some degree the changed conditions. At length, in April 1921, in a second reading debate on a private member's bill, the Government announced their decision; the Board's rule would continue for a while longer, but an effort would be made to reach agreement amongst moderate men of all parties as to the form in which the work done for national sobriety since 1915 could best be expressed in permanent legislation. There was sufficient response to enable the Government, in June, to set up a Round Table Conference of members of the Commons; the terms of reference were "to consider, with reference to the law of licensing, how best to adapt to times of peace the experience gained in time of war." The attorney-general (Sir Gordon Hewart) was chairman of the Conference, which comprised members chosen as representative of the temperance movement, the liquor trade, the clubs associations, and "average public opinion." Agreement was reached, and a bill, incorporating the terms of the agreement, subsequently introduced.

The bill, treated for the most part as a non-controversial measure, passed with exceptional rapidity and ease through all its stages, and received the Royal Assent on Aug. 17 1921. Its main provisions were (1) the appointment of eight hours as the period for the sale and supply of intoxicating liquors on weekdays outside the metropolis; (2) the appointment of nine hours for sale and supply within the metropolis; (3) the actual hours could be fixed by local licensing justices, provided that the first hour should not be earlier than 11 A.M., that there should be a break of at least two hours between the mid-day and evening periods of sale, and that the normal latest evening hour outside the metropolis should be 10 P.M., and within the metropolis 11 P.M.; (4) an additional hour for sale and supply was permitted after the normal evening hour for premises habitually providing "substantial refreshment, to which the sale and supply of intoxicating liquor is ancillary"; (5) further safeguards against the hawking of liquor were provided; (6) credit for "on" sales of liquor was prohibited; (7) the "long pull" was prohibited; (8) the dilution of spirits to 35° under proof, without notice to the purchaser, was permitted; (9) the "*bona fide*" traveller was abolished; (10) all the foregoing provisions were applied to registered clubs as to licensed premises, and were extended to the whole of Great Britain, thus bringing within the scope of the Act those parts of the country to which the Control Board's restrictions did not apply; (11) the properties of the

three State Management schemes, and their administration, were transferred as regards the English areas to the Home Office, and as regards the Scottish areas to the Scottish Office; (13) the Welsh Sunday Closing provisions were extended to Monmouthshire.

With the passage of this Act, the period of control closed. The Central Control Board (Liquor Traffic) came to an end two months later, on transfer of its responsibilities in the State Management districts. The Act was in itself a recognition of the worth of the work done for national sobriety by the Board during the six years of its existence.

Stationery Office); Henry Carter, *The Control of the Drink Trade in Britain*. (H. CA.)

### UNITED STATES

Nowhere is a wider range of experimentation or a greater variety of legislation dealing with the liquor traffic to be found than in the United States. The Federal Congress legislates for the District of Columbia and Federal territory, such as military and naval stations, Indian reservations, etc., located in the several states, and has exclusive control over interstate commerce. The 48 state Legislatures, before national prohibition was adopted in 1919, had almost exclusive independent and sovereign power to deal with the matter. The result was that a great number of statutes were enacted after 1910 for the regulation and control of the liquor traffic. There was, however, no new departure from the general principles of the liquor laws in force in the United States in 1910. The more important state statutes and the Federal legislation leading up to and including the adoption of the Prohibition Amendment to the Constitution in 1919 with its enforcing legislation (Act of Oct. 28 1919, National Prohibition Act, also known as the Volstead Act) are discussed in the article PROHIBITION.

The spread of state prohibition by both constitutional amendment of state constitutions and by enactments of state Legislatures was continuous during the five-year period prior to the adoption of national prohibition. On Jan. 17 1920, when national prohibition went into effect, only 15 of the 48 states had any "wet" area and of the total pop. of all the states 68·3% resided in "dry" areas. The land area under prohibition was 95·4% dry as compared with 4·6% under licence by state law, although this fact is perhaps less significant than the percentage of population. National prohibition provided for "concurrent" power in the Federal Congress and in the state Legislatures for its enforcement so that many of the state Legislatures, since national prohibition went into effect, have taken their own measures for the definition and enforcement of state-wide prohibition, which may be more, but not less, than strict national constitutional prohibition or the enforcement legislation enacted by Congress. Local option within the several states made continuous progress (1910–9) and resulted in the extension of dry territory, all kinds of expedients being employed to protect the population of dry areas, against the influence and practices of contiguous wet areas.

A considerable and interesting effort has been made in many states to provide by legislation for the treatment of inebriety, the prevention of public drunkenness, and the protection of minors and habitual drunkards and persons in an intoxicated condition to whom the sale of intoxicating beverages was prohibited by state and local laws and ordinances. Liquor selling in connexion with dance-halls and places of public amusement and recreation has been increasingly restricted or prohibited by state and local legislation in the interest of public morals.

(S. MCC., L.)

**LISTER, JOSEPH LISTER, BARON** (1827–1912), English physician (*see* 16.777*), died at Walmer Feb. 10 1912.

**LITHOGRAPHY** (*see* 16,785).—The most important development in lithography during the decade 1910–20 was the invention of the mechanical transfer machine. This machine eliminates the pulling-over of the design upon the press plate by hand labour, the process being termed "mechanical transferring." The design or designs are positioned on the metal plate with the aid of photo-lithography. The plate is prepared for the mechanical transfer in practically the same way as for hand transferring from lithographic stones; that is, the plate is first grained to hold water when printing and then counter-etched to secure a clean surface. The plate is next coated with a light-sensitive solution such as bichromated albumen, after which it is placed in the mechanical transferring machine in contact with a negative, representing the picture, or a colour of the picture, and exposed to light. The plate is then covered with ink, and the albumen not affected by the light washed away with water, leaving the image, or images, in hardened albumen. The plate is then etched, gummed up and is ready for printing.

The mechanical transfer machine consists of a metal plate-holder, in which the sensitized printing surface is placed, a negative holder, and an arc lamp. The print of the negative upon the press plate is obtained by either contact-printing or projection, the positioning of the image being controlled by an accurate system of gauges or dials. After one impression has been obtained, the printing plate or the negative is moved to where it is desired, according to the layout, that the next impression should appear.

Another method is to project or contact-print the image of a positive the required number of times upon a large negative. This multiple negative is then placed in a contact-printing frame and exposed upon a sensitized press plate the desired number of times through moving the negative by hand, according to a system of register marks. Still other variations are in use.

**LITHUANIA, REPUBLIC OF.**—Lithuania is on the whole a low-lying country watered by the Niemen ("Niemunas"—name of a heathen deity) and its tributaries. The highest part is in the south and east, where the Baltic hills extend in crescent formation from Gumbinnen in East Prussia through Suvalki (Suwalki) and Vilna to Dvinsk. This chain of hills is broken by two valleys, that of the Niemen flowing through Grodno and Olita to Kovno, that of the Vilya, flowing from Vilna to Janov to its junction with the Niemen below Kovno. In the north-west is situated another triangle of hills, the Telshi-Shavli-Rossieni. Between these two hilly regions lies the plain of the Niemen with its two principal tributaries, the Niaviaza and the Dubissa flowing in from the north. The only other river of importance is the Svienta, flowing south-west to join the Vilya near Janov, and in the north the Muscha, which joins the Aa at Bausk in Latvia.

*Early History.*—For early history *see* LITHUANIANS AND LETTS (16.789), also POLAND (21.902). The union between the kingdom of Poland and the grand duchy of Lithuania was brought about on Feb. 14 1386 by the marriage of the Lithuanian Grand Duke Jogaila (Jagello) to the Polish Queen Jadviga and confirmed by the subsequent pacts of Vilna in 1401 and 1432, of Horodlo in 1413, of Grodno in 1501 and 1512 and, parliamentarily, of Lublin in 1569. Thus was established a political combination in which Lithuania in point of territory was three times the size of Poland. The contracting parties were to retain their names, laws, administrative institutions, financial and military organizations. Through the fact, however, that from 1501 onwards the Lithuanians and the Poles were ruled over by one sovereign and from 1569 onwards had a common legislature, the former, though ever anxious to break away, gradually sank into a state of dependence. The Poles, past-masters in the art of political intrigue, never lost an opportunity of imposing their hegemony. Accordingly the Dual State was involved in a common downfall, and in the three partitions of 1772, 1793 and 1795 to which it was subjected at the hands of Russia, Prussia and Austria, Lithuania fell a prey to Russia and Prussia. But, while the Tsarist régime, unable to denationalize a homogeneous population of a different religion and language, initially conceded a minimum of rights to the Polish nation, in Lithuania proper from the outset an unrelenting system of tyranny was established which was designed to break by force every non-Russian element in the country.

Russia had annexed the six Lithuanian Governments between 1772 and 1795 and united them as the "Litovskaya Guberniia" in 1797, that is to say, before the Treaty of Vienna conceded her the kingdom of Poland in 1815. At the Warsaw Diet of 1818 the liberal-minded Alexander I. still spoke of the reunion of Lithuania with Poland under constitutional forms. But the project lapsed because already then any measure of self-government by extending the power of the Polish "szlachta" (land-owning noble class) in Lithuania menaced Russia's influence in that country which strategically rounded off her north-western frontier. Yet, under the

influence of the Polish Prince Adam Czartoryski, Alexander I. encouraged education and enterprise. The cultural influence of Vilna University produced the poet Mickiewicz and others.

In the closing years of Alexander's reign events in Poland cast their shadow before them, and in answer to political conspiracies Novosiltsov, formerly adviser to the Grand Duke Constantine as governor of Poland, upon his transfer to Lithuania initiated the persecution of liberal thought. Under the new Tsar, Nicholas I., the plan of the reunion of the two states was definitely rejected, his ukase of 1839 making of Lithuania the "Sievero-Zapadny Krai" (North-western Province).

As a result of the Polish rebellion of 1830, in which the peasantry, whether Lithuanian, Polish or White Russian, did not take so great a part as the upper classes, the university of Vilna was abolished in 1832, its faculties being transferred in bulk to Kiev and in part to Kharkov and St. Petersburg; Catholic and Uniate Church property sequestrated from 1836 onwards; the Lithuanian Statute, which had remained the law of the land through four centuries of union with Poland, replaced by the Russian code in 1840, while prominent natives, debarred from public service in their own country, were forced to emigrate or exiled to Siberia. Even the reign of Alexander II. bringing no changes in Lithuania and only slight modifications in the kingdom of Poland, the revolutionary spirit led to the great rebellion of 1863.

This abortive insurrection in which the Polish nobility and intelligentsia were primarily involved, though the Lithuanians also took a prominent part, led to the suppression of the printing of Lithuanian books by the dictator Gen. Muraviov, which measure was only abolished in 1904.

The Tsarist policy was henceforth perfectly consistent in that it strove to make Lithuania a genuine part of Russia and sought to extirpate Polish culture beyond the frontiers of the kingdom. Under these circumstances began in 1864 the great persecution of the "croyance Polonaise," as the Catholic faith was called. However fiercely conducted, it failed, though the Uniate Church with slighter powers of resistance was now completely forced into Orthodoxy, its ceremonial being definitely forbidden and its monasteries dissolved. The attack upon Polish property by the edict of 1865, though never fully applied, prevented the increase of Polish-owned estates for 40 years. The additional taxation of 5% on all incomes derived from land, imposed in 1869 and not repealed until the reign of Nicholas II., together with the suppression of the Polish language in all official matters, served the same ends. By way of reprisal land was taken from Polish owners and given to Russians, and settlements were established for colonization purposes—a measure of this kind taking place as late as 1913—so that proportionately more convicts and political exiles were sent into Lithuania than even into Siberia. The abolition of serfdom without cancellation of the peasants' prerogatives as to pasturage and timber rights served to accentuate class-antagonism. Further, Lithuania was specially excluded from the Zemstvo system which was introduced into Russia in 1864.

An early expression of reviving Lithuanian national consciousness was the appearance of the newspaper "Ausra," which, printed in East Prussia, lived for three years, though even in that short period its editor, banished from Germany, had to take refuge at Prague. It was socially significant that he and his political collaborators were drawn of the stock of newly emancipated peasants.

In Prussian Lithuania a craftier policy allowed greater outward liberty, though the process of German colonization, seconded by persecution, restricted the Lithuanian language which was once dominant in East Prussia to barely five districts (Tilsit 38%, Heydekrug 61·9%, Memel 47·1%, Ragnit 27%, Labiau 30%).

*Period of Popular Representation, 1905–14.*—Russia's defeat in the Russo-Japanese War and the revolution which followed in its wake led, in Sept. 1905, to a measure of reform in the Russian system of government in Lithuania. The first National Lithuanian Assembly, which, however, in the eyes of the Tsar's Government was merely a revolutionary body tolerated for the time being, met at Vilnius (Vilna). It consisted of two thousand delegates who demanded autonomy for the four governments of Vilna, Kovno, Grodno and Suvalki under a Diet at Vilna to be elected by universal, direct, equal and secret franchise. It was the first modern attempt to define Lithuania ethnographically, to respect national minorities and continue the connexion with Russia upon the federative principle.

The Tsar's Government under the electoral statute of 1905 granted the four-class franchise (landowners, peasants, townsmen and workmen) in such wise as to favour the rural population. Only Poles were elected to the first Duma in 1906.

As the imperial ukase which followed the dissolution of the second Duma in 1907 conferred more power upon the great landowners, it was modified as regards Lithuania by a nationality clause which provided that the total of electors of each class should be in proportion to the amount of land possessed by the respective nationalities in the district. This measure, applied by Russian officials, was designed against the Poles and the Lithuanian Nationalists alike, for not even the Progressives who favoured autonomy for Poland contemplated its grant to Lithuania. In the third Duma the five delegates allotted to the non-Russian population of Vilna government were all Poles who joined the Polish party; in Kovno government three delegates were Lithuanians, one was a Pole and one a Jew.

*War Period, 1914–20.*—The outbreak of the World War in 1914 led to a German invasion which, from midsummer 1915 until Aug. 1919, lay heavily upon the land, which was ruthlessly exploited. To further their own purpose, which was the lasting hold over Lithuania, the Germans after the military collapse of Russia allowed the phantom existence of a State. While a Lithuanian conference met at Vilna (Sept. 18–23 1917), and, in negotiations which dragged until March 1918, petitioned the then German Chancellor, Count Hertling, for the restoration of the country's independence under condition of a perpetual alliance between it and the German Empire ("Bundesverhältnis"), the German clerical party caused the "Taryba," or Council of State, which was then unavoidably still largely under the control of their army of occupation authorities, to offer the Lithuanian crown to Prince William of Urach, a younger member of the Württemberg reigning family. On July 11 1918 he accepted under the title of "Mindove II., King of Lithuania," thus strangely choosing the style of a heathen prince of the 13th century who fiercely resisted the Teutonic order.

While the opposition of the German annexationists thwarted this candidature which the Council of State eventually cancelled (Nov. 2 1918), their delegates at the peace negotiations of Brest Litovsk, in March 1918, on the contrary upheld against Trotsky the authority of the Lithuanian Council of State despite the fact that they had previously refused to regard it as the "legal representative of Lithuania." Their last argument rested upon this, that "Germany had recognized Lithuania's independence only on the condition that the conventions to be concluded, among them, of course, the form of constitution and the choice of a ruler, shall correspond to German interests" (*Nordd. Allgem. Zeitung*, Aug. 1918).

By Nov. 1918, the magnitude of Germany's defeat being no longer in doubt, the Taryba, or Council of State, promulgated a provisional constitution under which it became the Lithuanian Parliament. The supreme power was vested in three persons, A. Smetona, J. Staugaitis, and St. Silingas, who on Nov. 5 1918 invited Prof. Voldemar to form the first independent administration on non-party lines and reach an understanding with the national minorities resident within the still indeterminate frontiers, viz. White Russians, Poles, Jews and Great Russians. Alone the Pan-Polish party reverted irreconcilably to the historic solution of union or federation with Poland. The initial difficulties of setting up an administrative machine on national lines were the greater as the troops of the occupying Power, affected by the revolution which had broken out in Germany, engaged in pillage and highway robbery, which a national militia as yet barely armed had to suppress. The German troops were to a large extent composed of men who had been on the eastern front for some time, who had never themselves suffered defeat by the Allies, and were therefore indisposed to admit themselves beaten. They behaved in the most high-handed, brutal and truculent manner. Although Kovno itself was evacuated in June 1919, and shortly afterwards southern and eastern Lithuania, the area Mitau–Shavli–Taurogen remained in their hands until Dec. 13 of that year. In their withdrawal, by a historic disregard of fair play, the Germans not merely refused to put at the disposal of the Lithuanian authorities the necessary means of defence, but under a military convention allowed the Bolshevist troops to march into evacuated zones at a mean distance of 10 kilometres. They were by this procedure, moreover, directly violating the terms of the Armistice concluded with the Entente Powers on Nov. 11 1918. Thus in lieu of the German appeared the Bolshevist menace.

The Voldemar administration resigned on Dec. 26 1918, the

new premier, M. Slezevicius, widening the Cabinet on coalition lines. Prof. Voldemar, whom the precarious situation of the country and the approaching Peace Conference called to Paris, served as Foreign Minister, M. Yčas as Finance Minister, M. Velykis as Minister of War. In Jan. 1919 the near approach of the Bolsheviks to Vilna caused the removal of the Government to Kovno. Owing to this menace of the enemy and disputes over very urgent questions the Provisional National Assembly was elected with difficulty, but in session at Kaunas (Kovno) from Jan. 16–23 1919 it recognized the Council of State ("Taryba") and the Slezevicius Cabinet as the regular Government of Lithuania, which had the confidence of the country. Thereupon, although large stretches of territory were still in enemy occupation, the Taryba voted the provisional constitution, elected A. Smetona President of the State, and composed the statute for the election of the Constituent Assembly by universal, equal, direct and secret franchise according to a proportional system based on d'Hondt's distributive principle which contains elaborate safeguards against the tyranny of the majority. Despite the most painful conditions, national defence began to be organized at first in the form of volunteers and afterwards by regular troops. Under these circumstances the Bolshevist advance reached its culminating point in May 1919, when the Soviet armies occupied Telshi and Shavli in the north and Olita in the south, thus threatening Kovno itself. Until Sept. 1919 fighting took place against the Bolshevist forces, which were successfully cleared out of the northern districts of the country, and until Dec. of that year against the so-called Bermondt troops, and sporadically all through 1920 against Polish units. The Constituent Assembly, or "Seimas," composed of 112 members, met on May 15 1920. The President of the State, the National Council and the Cabinet resigned, and, all power passing to the assembly, the provisional Government gave way to the permanent Government.

Meanwhile the Polish Government's proposal for joint action against the Bolsheviks was rejected pending Lithuania's recognition as an independent state with Vilna for its capital. The state of war with Soviet Russia, however, continued until the Peace Treaty of July 12 1920, whereunder the Lithuanian claim to Vilna and Grodno was recognized by the Bolsheviks and Lithuania received three million rubles in gold and 100,000 hectares of forest land for exploitation.

The Polish war against Soviet Russia continued. The initial victories of the Bolsheviks were followed by defeat and the victorious Poles, under the so-called "rebel" Gen. Zeligowski, on Oct. 9 1920 drove the Lithuanians out of Vilna, which they had temporarily occupied after the retreat of the Soviet armies.

This incident leading to an informal war between the Lithuanians and Gen. Zeligowski's so-called mutineers, the matter was taken up by the League of Nations, which strove to establish the fate of Vilna and other disputed areas by means of a plebiscite. An armistice was concluded with effect from Nov. 30 1920.

In the beginning of March 1921, direct negotiation between Poland and Lithuania under the auspices of the League of Nations, to be followed by arbitration on unsettled points, was proposed in lieu of the plebiscite and agreed to by all parties.

The independence of Lithuania *de facto* was recognized by Sweden, Norway, England, Esthonia, Finland, France and Poland; *de jure* by Germany on March 23 1918, by Soviet Russia on July 12 1920, by Latvia and Esthonia in Feb. 1921 and by the Argentine Republic in March 1921.

*Constitution.*—The provisional constitution adopted by the Constituent Assembly on June 2 1920 describes the State of Lithuania as a democratic republic, over which, until the final constitution is established, the president of the Constituent Assembly (A. Stulginskis) rules as temporary President, whose acts need to be countersigned by the premier.

*Territorial Possessions.*—Ethnographical Lithuania (approximately as defined in the Soviet Peace Treaty of July 12 1920) includes:—

(1) The whole of the former Russian province of Kovno (20,260 sq. km. and 1,657,000 inhabitants);

(2) The province of Vilna, minus the districts of Disna and Vileika (29,818 sq. km. and 1,538,000 inhabitants);

(3) Part of the province of Grodno north of the Niemen river and the narrow hinterland of Grodno city in the south (say 2,000 sq. km. and about 100,000 inhabitants);

(4) The province of Suvalki, minus the southern parts of the districts of Suvalki and Augustovo (Augustow) (10,000 sq. km. and 615,800 inhabitants);

(5) Parts of the former province of Courland between the old German frontier and the Holy Aa river, as also part of the district of Illuxt.

Including the Memel area, to which the people aspire as an outlet to the sea, it may be said that 4,295,000 souls inhabit ethnographical Lithuania. Of these only 1,844,000 residents of Kovno are fully under State control plus from 33 to 50% of the 615,000 persons inhabiting Suvalki province.

The remainder of the Suvalki population is under Polish governance, as also nearly the whole of the 1,471,000 persons inhabiting Vilna province and the 139,000 inhabiting Grodno province. In the Memel area 165,000 persons are under temporary French occupation; in the Polangen district 3,000 under Lettish governance. In the disputed Illuxt area 53,000 persons are also under Lettish rule. Thus not less than 1,143,500 subjects, or just one-half of the total, are temporarily or permanently not under the jurisdiction of the Lithuanian State.

*Religion and Education.*—In the Vilna, Kovno and Suvalki provinces Roman Catholics make up 75·2% of the population, Jews 12·5%, Orthodox 8·9% and Protestants and Calvinists 3·5%. Elementary school education (4 years' teaching) is not yet compulsory. There is a higher training course, but as yet no university. Secondary schools are few, one foreign language being compulsory. The official language being Lithuanian, Russian is almost universally understood. Polish, Yiddish and German are widely spoken.

*Economics.*—In the provinces of Vilna, Kovno and Suvalki 71·4% of the population belong to the rural class, industry and commerce absorbing 12·8%. Of the 82,000 sq. km. in question before the war 40% belonged to the large estate owners, 10% to the Government and the churches, 50% to the farmers. Of the last-named class 30% owned less than 3 hectares, 60% from 10–50 hectares, 3% from 3–10 hectares, 1% from 50–100 hectares, while 17% of all the villagers were landless. An agricultural reform initiated by the provisional Government aims at the distribution of the fallow lands of the large estates and the better exploitation of the land.

*Agriculture.*—Lithuania is essentially an agricultural country in which the soil is richest in the old Kovno Government, north of Suvalki and north-west of Vilna. Grain of all kinds (chiefly rye), clover and potatoes are grown. Flax is mainly grown in the northern districts of Kiejdani, Shavli, Ponevyez and Rakishki.

In 1920 the territory administered by the Lithuanian Government (5,200,000 hectares out of 8,500,000 hectares) yielded:—

| | |
|---|---|
| Rye | 10,000,000 cwt. |
| Wheat | 1,500,000 " |
| Barley | 3,000,000 " |
| Oats | 5,000,000 " |
| Potatoes | 20,000,000 " |
| Peas | 1,200,000 " |
| Flax seed | 700,000 " |
| Harl | 730,000 " |

As regards live-stock raising there were in 1920 in the same area:—

| | |
|---|---|
| Horses | 380,000 |
| Cattle | 865,000 |
| Sheep and Goats | 730,000 |
| Swine | 1,400,000 |

*Forests.*—Twenty-five per cent of the whole extent of Lithuanian territory is covered by forests, 80% of which consist of needle-bearing and 20% of leaf-bearing trees. The country is thickly wooded (the areas under timber comprising some 25·5% of the whole against 85% fifty years ago). The most heavily wooded districts are in the southern and eastern parts (fir, pine, birch, aspen, alder and oak). Sixty per cent of the present output of timber being needed for internal consumption, about 200,000 festmetres are available annually for export. Coal has not been found, but peat may be exploited under favourable economic conditions.

*Manufactures.*—In 1913 there were 5,140 industrial establishments in Lithuania with 33,000 workmen and a yearly productive value of 62 million Russian (gold) rubles. During the war the larger industrial establishments were destroyed.

*Exports and Imports.*—In 1920 were exported farm products, live stock, fowls, timber and flax, valued at 501,297,000 marks, and imported foreign products and machines at 426,328,000 marks.

Lithuania requires primarily manufactured fertilizers and agricultural machinery and salt, sugar, herrings, manufactured articles, etc.

*Towns.*—The towns in order of importance are in political Lithuania: Kovno (Kaunas) with about 60,000 inhabitants, Ponevyez with 20,000, Shavli (Siaulial) with 8,146, Vilkomierz with 8,000. The ethnographical claim in its extreme form would include Vilna (Vilnius) with about 190,000 inhabitants, Grodno (Gardinas) with 51,000, Memel (Klaipeda) with 22,000, Suwalki with 21,000.

*Roads.*—The only first-class roads are: Kovno-Vilkomierz-Dvinsk; Kovno-Mariampol-Suwalki; Mitau-Shavli-Libau; Kovno

were purposely neglected under the Russian régime in the frontier area, Kovno itself being then a first-class fortress.

*Railways.*—The lines which existed under the old Russian Empire were converted by the Germans during their occupation from Russian 5 ft. gauge to German 4 ft. 8½ in. The total length is 720 kilometres. Double lines are: Wirballen–Kovno–Koszedari; Janov–Shavli; Kossedari–Jewie (to Vilna). Single lines are: Koszedari–Janov–Shavli–Murajevo–Lusha (to Mitau); Radzivilishki–Poneves–Jalovka–Kalkuni (which joins the Vilna–Dvinsk double line at Kalkuni); Murajevo (Musheikti)–Ringen (to Mitau with ballasted track for second line); Suvalki–Pinsk–Olita–Daugi (to Orani), which joins a double line at Orani. The following new single lines totalling 288 km. were built by the Germans during their occupation: Shavli–Pozeruni (to Tilsit); Shavli–Meiten (to Mitau); Memel–Bajohren–Skudi (to Prekuln and Mitau).

*Waterways.*—The length of the Niemen from Olita to the German frontier (village of Polejki) is 266 kilometres. The river, which is navigable for 8 months in the year, has been internationalised under the Treaty of Versailles as far as Grodno (extreme point for steamer navigation). Its width varies from 75 to 325 yd. as far as Kovno and thence to the Baltic from 185 to 650 yards. Its average depth is 3 ft. and its average speed of current 2½ m. per hour. The Vilya is navigable from its mouth at Kovno to Janov (40 kilometres). The Niaviaza is navigable from its mouth, northwest of Kovno, to Bobri (25 kilometres).

*Currency, Weights and Measures.*—Alone among the Baltic states Lithuania had as yet no national currency in 1921. Legal tender were the "Ostmark" (originally introduced by the German Military Administration of the Army of Occupation, "Militärisches Verwaltungsgebiet Ober-Ost"), which in Lithuania proper ranked *pari passu* with the German "Reichsmark," and other German fiduciary currency to a total not less than one milliard marks.

The weights and measures were still Russian, but the introduction of the metric system was contemplated in 1921.

*Laws.*—In all cases where special enactments had not yet been made the laws of the former Russian Empire were considered valid.

*Political Parties.*—The Seim (Constituent Assembly) in existence in 1921 was elected in April 1920 by universal, direct, equal and secret franchise. All men and women who were 21 years of age and all soldiers who were 18 years of age were entitled to vote. The Seim comprised 112 members, of whom 59 were Christian Democrats, 29 Popular Socialists, 14 Social Democrats, 6 Jewish party, 3 Polish party and 1 German party. The Peasants' party combined with the Popular Socialist party, while the "Workers' Federation" and the "Yeomen's Union" (these being but the small landowners) formed part of the Christian Socialist governing *bloc*. Legally recognized parties which were not represented in the Seim were: (*a*) the Progressive party (Pajanga); (*b*) the Liberal party (known as the Santara Union); (*c*) "Landlords' Association" (which comprised only large landed proprietors). The Social Revolutionary and the Communist parties were not legally recognized and were unrepresented. The president was chosen by the governing party, the Christian Democrats; the first vice-president by the Popular Socialists; the second vice-president by the Christian Democrats.

The Government which took office in June 1920 was a coalition Cabinet of the Christian Democrat and Popular Socialist parties plus three ministers who did not belong to any party. The Opposition was formed of the Social Democrat and the Polish parties. The prime minister was Dr. K. Grinius (Peasants' Union); Minister of Finance, Trade and Commerce and Communications, E. Galvanauskas (non-party); of Foreign Affairs, Dr. J. Purizkis (Christian Democrat); of War, Dr. Shimkus (Popular Socialist); of the Interior, K. Skipitis (Santara); of Education, K. Bizauskas (Christian Democrat); of Justice, V. Karobis (non-party); for Jewish Affairs, M. Soloveicik (Democrat); for White Russian Affairs, D. Siemasko (non-party); and of the department of Agriculture, Alexa (Popular Socialist).

*Army.*—The serious disadvantage under which the Lithuanian army suffers is the shortage of the officer class, but the sturdy, phlegmatic peasants should, under good leadership, make good fighting material. The army in 1921 was organised in 4 divisions, each division normally containing 3 regiments of infantry, 3 field batteries and 1 squadron of cavalry. The total number of units were, in the infantry, 28 regular battalions, 1 reserve battalion and 3 battalions of Frontier Guards; in the cavalry some 8 squadrons; in the artillery 9 field batteries; in the engineers 1 electro-technical and 1 auto battalion, a pioneer company and a railway operating company plus an aviation corps, or a total of about 1,200 officers and 35,000 men. This was the maximum expansion possible under the conditions prevailing in 1920–1, of a crisis in the political relations with Poland; but the maintenance of this establishment for any length of time appeared to be impracticable, since on this basis the army absorbed close on 60% of the revenue of the State, viz. some 460 million German marks.

*Climate.*—The climate of Lithuania is, on the whole, more moderate than that of other parts of Russia in the same latitude. Winter sets in normally at the end of Nov. and lasts till the end of March. The rivers are frozen from Dec. to Feb. Spring begins at the end of March. June, July and Aug. are considered the summer months. Autumn begins in Sept., light frosts occurring at its close.

**LIVERPOOL**, England (*see* 16.804).—The pop. of the city had increased from 684,958 in 1901 to 753,353 in 1911. The municipal area, which covered 16,619 ac. in 1911, was extended in 1913 so as to include the townships of Allerton (1,589 ac.), Childwall (830 ac.), Little Woolton (1,389 ac.), and Much Woolton (792 ac.), making a total area (exclusive of 2,883 ac. of river-bed) of 21,219 acres. The estimated pop. of this area in 1919 was 781,948 and the ratable value in 1920–1 was £5,114,256. The death-rate per thousand was 17 in 1919—almost the lowest on record for the city—but the death-rate from zymotic diseases remained proportionately high (0·96 per 1,000) and, under the insistence of the Home Office, it was decided to establish an experimental disinfecting station for the disinfection of all imported dangerous wool.

The city in 1921 was divided into 39 wards with 36 aldermen and 111 councillors, and the total number of municipal electors according to the 1920 register was 283,760. The 11 parliamentary divisions are:—the Scotland, Exchange, W. Toxteth, E. Toxteth, Edge Hill, Everton, Kirkdale, Walton, W. Derby, Fairfield and Wavertree. The electors numbered 355,755.

Under the Housing of Working Classes Acts, 1890–1909, 1,510 insanitary dwellings were demolished during 1910–5. During the period 1916–9, owing to conditions created by the war, no proceedings were taken, but in 1920 the Housing Committee were again giving attention to the pre-war schemes for demolition and rebuilding in various insanitary areas and had entered into contracts for the erection of 2,730 houses on the Larkhill Estate and 2,000 at Allerton.

The water-supply up to 1920 was derived in the proportions of 65% from Lake Vyrnwy, Riverton 29% and wells 6%, but, to meet the urgent need of an additional supply, the construction of a third main pipe from Lake Vyrnwy (to be followed by a fourth) was decided upon and the crossing of the Mersey is to be effected by laying pipes in the bed of the river. The average daily supply from all sources in 1919 was approximately 43,000,000 gallons.

Among important buildings completed since 1910 are the prominent Royal Liver building of 17 storeys and a tower 295 ft. high and the Cunard building, both near the landing-stage. The latter, in the Roman Renaissance style of the Farnese Palace at Rome, was opened in 1916. On July 5 1921, the Prince of Wales unveiled the bronze equestrian statue of King Edward VII. by Sir W. Goscombe John, erected on the river front between the Cunard building and the landing-stage.

At Liverpool University the foundation stone of a new engineering laboratory was laid on Oct. 22 1910. The Liverpool School of Tropical Medicine, in the same year, endowed a chair known as the Dutton Chair of Entomology, and in 1911 the cost of building a central hall for the Undergraduates' Union was undertaken by Capt. Gilmour. Sir William Hartley presented a wireless telegraphic installation for the purpose of experiment and research in 1913, and a plant for tests in connexion with the erosion of metals was established. A certificate in architectural design and a diploma in ophthalmic surgery were also instituted.

The work of building the cathedral (*see* ARCHITECTURE), which had practically ceased during the war, was being vigorously carried forward in 1921. The original design has been considerably revised and modified by the architect, Giles Gilbert Scott, A.R.A. Owing to the exigencies of the site on St. James's Mount the building lies north and south, the rubrical "east" thus pointing south. The general plan, which is marked by much individuality, consists of a great central space 200 x 72 ft., formed by a central tower with the crossings of two pairs of transepts; a choir in three bays, and a nave

—the whole to have an interior length of 480 feet. The central tower will be 335 ft. in height, and the principal portal of the cathedral will be at the west side of the tower, not at the traditional "west end." The stone is Woolton red sandstone, which weathers to a greyish pink in a smoky atmosphere. The Lady chapel, 114 ft. long, 35½ ft. wide and 58 ft. to the vaulting, was completed and consecrated in 1910 and has been embellished by the gift of a reredos from designs by Mr. Scott. It was decided in 1912 to proceed with the building of the choir, chapter-house and S.E. transept: the chapter-house with its copper roof was built by 1915 and the walls and vaulting of the choir and transept were completed in 1921.

The Council acquired the Harthill estate of 32½ ac. (1913), Walton Hall estate of 130½ ac. (1913), Walton Wood estate of 62 ac. (1917), and the Princes Park of 44½ ac. (1918); and in 1921 the total acreage of parks and open spaces within the municipal area was 1,386 acres.

The Mersey Docks and Harbour Board were in 1921 carrying out various important schemes of improvement of the port, the expenditure involved being about £10,000,000.

In 1906 the Board obtained parliamentary powers for the construction of new docks at the N. end of their Liverpool estate. The work was suspended during the war but has since been pressed forward. The scheme embraces:—(*a*) the construction of a great vestibule dock 1,070 ft. by 130 ft. to provide a depth of water of 48 ft. at high water of spring tides and having a river lock entrance; (*b*) a lock 645 ft. long and 90 ft. wide (opened in 1921) between the new dock and the adjacent Hornby dock; (*c*) two branch docks (to be called Gladstone dock No. 1 and No. 2) opening out of the vestibule dock and having three-storey sheds on the N. and S. sides. The Board also acquired 340 ac. of foreshore in Seaforth and Waterloo to the northward to meet future developments.

With the object of providing further facilities for the embarkation of passengers on ocean-going and local steamers, parliamentary powers were obtained in 1921 for the extension of the Prince's landing-stage by 500 ft.; and (to improve the cross-river ferry traffic) a small extension of the George's landing-stage at its southern end was in hand in 1921. Considerable progress had also been made with a scheme for electrification of the whole of the dock estate to provide, eventually, not only light but power for all the mechanical appliances. The cable work, including switch gear for the supply of the whole of the northern section of the estate, was practically complete in 1921 and involved the laying of about 40 m. of main cables between Sandon and Hornby docks.

To provide ample accommodation for the rapidly growing oil trade of Liverpool, the Board set apart a large area of land known as the "Parkhill and Dingle Estates" at the extreme S. end of the dock estate, and of this 25 ac. had in 1921 been leased to leading oil companies for the erection of oil storage tanks. Some of these were already in use in 1921 and when all are erected the tanks will provide storage for 140,000 tons of oil. Pipe lines to oil berths in the Herculaneum dock will enable tank steamers to discharge direct into the storage tanks. The reclamation of the foreshore and the extension of the Herculaneum river wall, undertaken in 1921, will provide further berths for oil steamers and barges immediately opposite the oil installation.

To meet the requirements of the East India and Colonial wool trade, of which Liverpool has become the chief centre in the United Kingdom, two immense warehouses have been built: that of Great Howard Street has "dead" storage capacity for 150,000 bales and that in Love Lane (completed in 1920) of 85,000 bales. Important work in connexion with the provision of stone revetments and training banks in the sea channels—the Queen's and Crossby—leading to the port was in progress in 1920. The proposal to construct a bridge between Liverpool and Birkenhead was revived in 1912 but, in 1921, was still being studied.

**LLANDAFF, HENRY MATTHEWS, 1ST VISCT.** (1826–1913), English politician (*see* 16.828), died in London April 3 1913.

**LLOYD, CHARLES HARFORD** (1849–1919), English organist and composer, was born at Thornbury, Glos., Oct. 16 1849. He was educated at Rossall and at Hertford College, Oxford, where he was one of the foundens of the Oxford University musical club, becoming its first president. In 1876 he became organist of Gloucester cathedral, in 1882 organist of Christ Church cathedral, Oxford, and in 1892 precentor and musical instructor at Eton. In 1914 he became organist at the Chapel Royal, St. James's. Dr. Lloyd was well known both as a teacher and as a composer, his best-known work being the cantata *Hero and Leander*, composed for the Worcester festival of 1884. He also wrote much church music. He died at Slough Oct. 16 1919.

**LLOYD GEORGE, DAVID** (1863– ), British statesman (*see* 16.832). After the constitutional conference of 1910 had failed, Mr. Lloyd George took his full share in the party campaign which ushered in the second general election of that year. He was especially sarcastic about the proposal for a Referendum, which was put in the forefront of Unionist policy. "A prohibition tariff against Liberalism," he called it. After the general election of Dec. 1910, which showed that the campaign of the Liberals against the Lords' veto had merely enabled them to maintain the somewhat precarious position established by the general election of the previous Jan., Mr. Lloyd George left the prosecution of the Parliament bill, and the subjugation of the Lords by means of a threat of promiscuous swamping, to the Prime Minister and other colleagues; and he devoted himself to the enthusiastic forwarding of his social programme, which was to show Labour that he and his party could and would do more to raise the condition of the workers than their professed advocates. His budget, which, owing to a realized surplus of £5,600,000, did not raise taxation, provided £1,500,000 for sanatoria for consumptives and £250,000 for the payment of members—a cause dear to the heart of Labour. This latter provision was carried in Aug. after a somewhat perfunctory Unionist protest in debate, by a majority of nearly a hundred.

But his principal contribution to social reform was in his National Insurance bill, providing insurance for all workers by means of contributions from employers, employed and the State. By it there was set up not merely unemployment insurance, administered under the Board of Trade, but National health insurance, which imposed a somewhat complicated card and stamp system on all employments, including even that of domestic service. In order to work the system, the coöperation of the doctors was essential, and the terms offered were hardly attractive. Mr. Lloyd George soared to uncommon heights of eloquence in pressing his scheme upon Parliament and the country, appealing earnestly for a measure which would relieve undeserved misery, help to prevent much wretchedness, and arm the nation until it conquered "the pestilence that walketh in darkness and the destruction that wasteth at noonday." Though benevolently received at first, the bill soon met with the banded opposition of the doctors, who protested that the terms offered the profession were absurdly inadequate; and it was far from popular with either the employing or the employed class, both of whom resented the liabilities imposed upon them, and the cumbersome process of stamp-affixing. This general unpopularity cost the Government some seats at by-elections; but Mr. Lloyd George stood firm, and the bill duly became law. But the doctors held out even after the bill was passed. The negotiations, carried on for more than a year, produced no agreement, and it looked as if the Act would break down through a boycott by the medical profession. But owing to Mr. Lloyd George's mingled diplomacy and tenacity, the minority in favour of acceptance slowly grew, and a sufficient number of panel doctors were registered to bring the medical benefit into effect on the appointed day early in Jan. 1913. Thereafter the opposition to the Act gradually died away, as its benefits to all parties became evident. A year later, in Feb. 1914, Mr. Lloyd George could claim that, out of 22,500 general practitioners in Great Britain, over 20,000 were on the panels.

In the discussions of the two bills going forward in the years 1912–4 under the Parliament Act, the Irish Home Rule bill and the Welsh Church bill, Mr. Lloyd George did not take a prominent part, though he was heartily in favour of both. Indeed he had been throughout one of the principal promoters of disestablishment in Wales, and, when he did speak, advocated it with almost apostolic fervour; but the conduct of the measure was in the hands of Mr. McKenna. This cause appealed to him not merely on its religious, but also on its social, side. It was, however, another social change, that affecting the land, to which, after National Insurance, he devoted his principal attention from the autumn of 1913 down to the outbreak of the World War. He even accused his opponents of dragging the red herring of Ulster across the trail of his projects of land reform. His earliest political campaign in Wales had been aimed against the landed interest; and he had made a further move in that direction in the taxation of land values in his budget of 1909. Though the Prime Minister, Mr. Asquith, formally disclaimed the notorious specific of advanced land reformers, the single tax on land, he sanctioned

an unofficial committee of inquiry which Mr. Lloyd George desired to institute in order to investigate rural grievances. The first essential condition of every social reform, Mr. Lloyd George said at Aberdeen in Nov. 1912, was change in the land system, which was still in its essence feudal. The first purpose of the land, he said, should be the provision of sustenance and shelter for the cultivator. The movement attracted a considerable amount of public support; and he found it a convenient subject to which to direct public attention after the shock to confidence produced in the spring of 1913 by the Marconi revelations, which showed, in the general estimation, a reprehensible carelessness in the private financial operations of the Chancellor of the Exchequer (*see* ENGLISH HISTORY). He advised purists to recall the manner in which landlord parliaments had bartered away the common land. The Liberals, he said at Sutton-in-Ashfield in Aug., were about to march against the central position where land monopoly was entrenched. During the autumn he made many eloquent speeches in different districts of England and Wales in support of his movement, denouncing agricultural conditions, bad wages, atrocious housing, damage to crops by game, insufficient prospect of small holdings; and also promising relief to harassed leaseholders in towns. At Swindon on Oct. 22 he detailed a ministerial scheme, which should recast the whole conditions of land monopoly. The main provision was the establishment of a Ministry of Lands, with comprehensive powers for the supervision of everything connected with land, and with a number of roving or local commissioners by whom in a general way these powers would be exercised. The Unionists scoffed at the idea of these hordes of despotic officials; and the course of events in 1914 prevented the scheme from ever seeing the light as a Government bill. But the spirit in which Mr. Lloyd George pursued his campaign was shown in a speech at Pwllheli in December. The landlord, he said then, was no more necessary to agriculture than a gold chain to a watch; a breath of liberty must be brought into the villages.

To realize the promises of these social campaigns Mr. Lloyd George required ever-increasing millions from the national purse. Indeed he may fairly be charged with having turned the Treasury from a department to control and limit expenditure into a spending department. Between the time when he took over the Exchequer in 1908 from Mr. Asquith and his last budget before the war, that of 1914, the national revenue and expenditure increased by about £55,000,000, reaching in 1914 nearly £210,000,000 in all. Besides the social expenditure, the other main item of increase was, of course, the navy estimates; and Mr. Lloyd George, in an interview published on the first day of 1914, declared that Liberalism would be false to its trust if it did not seize the opportunity of what he asserted to be the improvement in Anglo-German relations to diminish expenditure on armaments. Happily, though many Liberal associates responded, the common sense of the Cabinet and of the public prevented any such suicidal operation, and the navy estimates laid before the House were the highest on record. To meet the increased expenditure Mr. Lloyd George, who had been content to mark time in his budget for 1913, made, in 1914, new proposals which carried to a further pitch the principles of the budget of 1909. He had to meet a deficit of £3,330,000, which he increased to £9,800,000 for further larger grants for social purposes, such as education, health and insurance. To procure this heavy additional sum he took £1,000,000 from the Sinking Fund and then fell back once more on income tax, supertax and death duties. There were to be increases of the higher grades of income tax, which was to rise to 1s. 4d.; supertax was to begin with incomes of £3,000, rising to the same maximum of 1s. 4d.; and the rates of death duties were to be raised from all estates over £60,000, rising to a maximum of 20% for a million. There was also to be a national system of valuation for local taxation, including the taxation of site values. An outcry from Liberals no less than Conservatives caused him to abandon the extra penny on the income tax, so that the maximum would be only 1s. 3d.; and therefore to postpone many of the grants for social purposes for a year. But, with some modifications, the rest of the budget passed, not without difficulty, into law.

With all these schemes of social betterment in his head he was eager for short-cuts in the matter of Irish Home Rule. At Huddersfield on March 21 he violently attacked the House of Lords and the province of Ulster, denounced the doctrine of "optional obedience," and dwelt on the necessity of settling the Home Rule controversy in order to open the way to deliverance from social wretchedness. At the Mansion House in July he insisted that in view of the threatened war between capital and labour at home and between Nationalist and Orangeman in Ireland, it was the duty of responsible men of all parties to work for peace; and he himself took part in the abortive Buckingham Palace Conference, and impressed his opponents with the sincerity of his desire for an agreed settlement.

The sudden approach of the World War threatened an even more complete end to his social Utopias. Accordingly, in spite of the fact that he had made in 1911, at the time of the Agadir incident, a spirited declaration that Great Britain was determined at all hazards to maintain her place among the Great Powers, he was slow to realize her peril and her duty in the last days of July, and clung, down to a late hour, to the policy of neutrality. When once, however, he was convinced, by the German violation of Belgium, that honour and justice and human liberty demanded British intervention in arms, he reverted to his position of 1911, and was from the beginning to the end the most resolute of all British ministers to prosecute the war to a triumphant conclusion.

As Chancellor of the Exchequer it was his duty to provide at once against a financial collapse. Ever since the budget of 1909 there had been a coldness between him and the natural friends of the Exchequer, the bankers and merchants of the City of London; but he and they buried the hatchet at once, and he had their advice and aid in the measures which were promptly taken. He availed himself liberally of the assistance of his friend, Lord Reading, in this connexion, with excellent results. On Nov. 17 1914 he introduced the first war budget. He had to meet a deficit of nearly £340,000,000; and he determined to follow the precedents set by Pitt and Gladstone and to raise a considerable portion by taxation. Accordingly he doubled the income tax and supertax; added an extra ½d. a half-pint on beer; and raised the tax on tea by 3d. a pound. He calculated that in a full year his new taxation would provide over £65,000,000, and for the current year he raised £2,750,000 by a partial suspension of the Sinking Fund. To meet the remainder of the deficit he announced a War Loan of £350,000,000 at 3½% issued at 95. Moreover, in order to further the recruiting campaign he made eloquent appeals this autumn to those sections of the people with whom he was peculiarly associated, to Welshmen at the Queen's Hall in London and at Criccieth, and to the Nonconformists at the City Temple. He dwelt on his own record as a man of peace; but insisted that peace could not have been had this August without national dishonour. If treaties could be disregarded as "scraps of paper," why should any regard be paid to bank-notes and bills of exchange? He appealed to the great principles of Duty, Patriotism, Sacrifice. Peace at any price was not a Christian principle. The only way to establish peace on earth was by making the way of the peace-breaker too hard for rulers to tread.

Early in the next year, 1915, Mr. Lloyd George attended a conference of finance ministers in Paris, where it was agreed that each of the Allies should bring to the common cause that which they were most competent to supply, without reference to any principle of equal sharing by all. This was one of the first of those services to the cause of more intimate cooperation among the Allies which he was to make peculiarly his own in subsequent years. There was no change of taxation in his budget this spring. He bent his whole energies this year to the increase of munitions of war, wherein British supplies were lamentably deficient. He first sounded the note on March 9 in introducing a new and drastic Defence of the Realm bill, whose object was the mobilization of industrial resources, and which gave Government wide powers of commandeering factories capable of turning out munitions. He called a conference of trade-union representatives on March 17 with a view to preventing strikes and stoppage of work and

removing all restrictions on output; and announced that Government would limit the profits of employers. He pointed to drink as one of the great drawbacks to increased output. "We are fighting," he said, "Germany, Austria and drink; and as far as I can see the greatest of these three deadly foes is drink." The regulation of drink was relegated to a Board of Control with wide powers. But, in the face of a minimizing speech from Mr. Asquith at Newcastle, Mr. Lloyd George enlarged in the House of Commons on the absolute necessity of an enormously increased output of munitions, and of munitions of a different kind. Public opinion strongly supported him, with the result that, in the Coalition Ministry which Mr. Asquith formed in May, a new department of munitions was created, with Mr. Lloyd George as Minister of Munitions.

He flung himself with ardour into this new work; appealed for and obtained the coöperation of eminent men of business and experts, divided up the country into 10 munition areas, went in person to the great centres of trade and manufacture, Manchester, Liverpool, Cardiff, Glasgow, and urged the imperious necessity of setting to work as one man, of removing all limiting restrictions, of planting the flag on the workshops. He was indefatigable in conferences with the unions to persuade men to consent to abrogate the Eight Hours' Act and to consent to labour dilution, and to suspend all hampering rules, promising that all should be restored in their integrity after the war. He had a considerable measure of success, owing largely no doubt to the confidence felt by the working-men in a minister who had devoted himself so whole-heartedly to social betterment. He took special powers in the various Munitions Acts to deal summarily with labour difficulties in the factories. Meanwhile, all over the country, shops that had previously turned out utensils of peace were converted into factories of munitions; new factories were rising, sometimes in the most secluded and unlikely spots, and volunteers, men and women, were pressed into the service. The heartening orations which Mr. Lloyd George had made since the war broke out were collected into a shilling volume in the autumn under the title "Through Terror to Triumph." In this winter and in the spring of 1916 there were troubles on the Clyde, where the very small leaven of revolutionary feeling was concentrated; but the strong measures, including the arrest of six ringleaders, which Mr. Lloyd George and his Munitions Ministry took, brought appeasement before long.

His absorption in his new and engrossing work did not leave Mr. Lloyd George much leisure for dealing with other aspects of the critical situation; but he made a strong speech in May in favour of the second and comprehensive Military Service bill of 1916, in which he said that he would rather be driven out of the Liberal party and indeed out of public life than have on his conscience that he opposed a bill calculated to supply the men who, in the opinion of the military authorities, would make all the difference between defeat and victory. No country, he maintained, had saved itself from great military peril without resort to compulsory service. A call was also made by his ministerial colleagues on his powers as a peacemaker after the Dublin rebellion had convinced Mr. Asquith that the system of Irish government had broken down and that there was a unique opportunity for a new departure. He was authorized to put himself in communication with all Irish parties and endeavour to promote a settlement. Accordingly in June he came to a preliminary arrangement with both Nationalists and Ulstermen, on the basis of bringing the Home Rule Act into immediate operation, and of introducing an Amending bill to cover only the period of the war and a short interval after it, during which the Irish members were to remain at Westminster and the six Ulster counties to continue under the Imperial Government. Neither southern Irish Unionists nor English ministers were happy about these proposals; and some small changes made to conciliate them were taken by Mr. Redmond as a ground for abandoning the negotiations, though Mr. Lloyd George maintained that the arrangement was still one that might well be accepted.

Meanwhile Mr. Lloyd George's relations to the war had become still more intimate and responsible. On the sudden death of Lord Kitchener, it was felt necessary to instal in the War Office a statesman on whose determination and energy both the nation and the Allies could rely; and Mr. Lloyd George had now come to fill so large a space in the civilian administration of the war that no other choice would be acceptable. He took Lord Derby, the hero of the voluntary recruiting campaign, as his Under-Secretary. The spirit in which he proposed to administer his office was shown in an interview which he granted in Sept. to an American journalist. Britain, he said, had only begun to fight. The British Empire had invested thousands of its best lives to purchase future immunity for civilization. After all these sacrifices "the fight must be to a finish—to a knock-out"—a view which, when it was challenged, the House of Commons warmly supported. Desiring to promote the war in this spirit, he showed justifiable anxiety both about the number of exemptions allowed under the Military Service Acts and about the unsatisfactory results of recruiting in Ireland. But what gave him the keenest anxiety was the defective constitution and limited authority of the War Committee of the Cabinet. It was too large, it did not meet sufficiently often, it was subject to the over-ruling of the Cabinet, and its chairman, Mr. Asquith, was overburdened with other duties, including the leadership of the House of Commons, and had hardly the temperament of a resourceful and enterprising controller of war. Public opinion, in the press and in the Parliamentary War Committees, was becoming mobilized in this sense. Accordingly, on Dec. 1 Mr. Lloyd George wrote to Mr. Asquith demanding, on threat of resignation, that the conduct of the war should be placed in the absolute control of a small committee of four, sitting day by day, including himself but not including Mr. Asquith. In the negotiations which followed and in which Mr. Lloyd George made some concessions in order to win Mr. Asquith if possible, it became clear that the result would be to transfer the main conduct of the war from Mr. Asquith to Mr. Lloyd George. This was eventually effected by the formation of a Ministry under Mr. Lloyd George, with Mr. Bonar Law as his partner, and with the support not only of the Ministry but of the Labour party, and a large contingent of the Liberals, while Mr. Asquith and his immediate friends remained outside but did not oppose.

Mr. Lloyd George's advent to supreme power was well received, as his reputation as a War Minister had steadily augmented from Aug. 1914 onwards; and by constituting a War Cabinet of four persons in permanent session with full powers, and transferring the leadership of the House of Commons to Mr. Law in order to devote himself to the conduct of the war, he strengthened the good impression of the public. They welcomed also the evidence of determination given by the creation of new departments—Food, Labour, Shipping, Pensions, National Service; by the assumption by Government of control over shipping and mines, and by the appointment of business men and experts to some of the more important posts. They welcomed too his firm reply to the German Chancellor's peace overture: "We shall put our trust in an unbroken army rather than in a broken faith"; and his decision to summon the Prime Ministers of the Dominions to a series of special meetings of the War Cabinet. His popularity was increased by the discovery in Jan. 1917 of a conspiracy in a Derby family of anarchists to murder him and Mr. Henderson, his Labour colleague in the War Cabinet. Three of the family were found guilty at the Central Criminal Court and sentenced to substantial terms of penal servitude. Sympathy was again roused later in the year when it was suggested by a portion of the press that he—one of the most courageous of men—had left London to avoid an air-raid. The offenders apologised and withdrew, agreeing to indemnify the Prime Minister for his costs.

The successive measures taken by the Government in the next two years and a half to carry out its policy of subordinating everything to the prosecution of the war to a victorious conclusion, and of marshalling the whole of the resources of the nation for that one purpose, are detailed in the article on ENGLISH HISTORY. So far as the work was done in Parliament it was carried through mainly by Mr. Bonar Law. Mr. Lloyd George adhered closely to his programme of concentrating his own energies on the day-

by-day conduct of the war in the War Cabinet, and in the War Councils of the Allies of which he was so keen a promoter; and he spoke comparatively seldom in the House of Commons save at critical moments, or in order to give Parliament from time to time an authentic statement of the progress of the national cause. But he took upon himself the duty of heartening and inspiriting the nation, and made, as occasion served, eloquent appeals to his countrymen, sometimes by letters and messages, sometimes by speeches in the City of London or in big towns. In these he constantly sounded that note of sacrifice which had been the text on which he had preached in the first of his great war orations, in the City Temple in the autumn of 1914. Thus in Carnarvon in Feb. 1917 he appealed for support to the Government in men, money and labour, in the sacrifices of conveniences and even of comforts. In order to win, Britons must endure more. In the past the sacrifices had been too much relegated to the trenches. He appealed to housewives to see, each one in her own home, that not an ounce of food was eaten beyond the amount laid down by Lord Devonport, the Food Controller. Those who were doing nothing should do something; those who were doing something should do more and all should do their best. Everyone who had got enough land to grow a potato or a cabbage must use it for that purpose. If train services were inconvenient and fares increased, people should remember that the limitation of railway facilities helped the army in France. At Dundee in July he urged the cheerful acceptance of restrictions which, he declared, could not yet be regarded as privations. In a message to the nation at the beginning of the critical last year of war, he wrote:—

> The sacrifices which the men—and the women also—are making at the front we all know. Despite all that they have gone through, they are still facing frost and mud, privation and suffering, wounds and death, with undaunted courage, that mankind may be freed from the tyranny of militarism and rejoice in lasting freedom and peace. No sacrifice that we who stay at home are called to make can equal or faintly approach what is daily and hourly demanded of them. So long as they are called upon to endure these things let us see to it that we do not take our ease at the price of their sacrifice.

He appealed during this year to Labour men to surrender the pledges given them about recruiting, to farmers to concentrate on potato-growing, to women to abandon a life of ease and come upon the land, and to munition workers to remember their exemption from the dangers of the front and not imperil the national cause by wanton strikes.

At the same time he never failed to proclaim that victory could be won if all did their best and maintained a stout heart. At the Guildhall in Jan. 1917 he told his hearers that the feeling of the Allies at their recent conference in Rome was that if victory was difficult defeat was impossible. The Allied peoples were looking more and more to Great Britain. She was to them like a great tower in the deep: the hope of the oppressed and the despair of the oppressor. While there was much, he told the people of Carnarvon in Feb., in the existing state of affairs—especially the "piratical devices" of the German submarine—to cause anxiety, he had never had any doubt of ultimate victory; neither had he any doubt that, before we reached it, there were many broad and turbulent rivers to cross which the nation must help to bridge. Even at the period when the losses from submarines were greatest, he refused to be daunted and reassured the country by his confidence in the Admiralty's plan of defence, and in the adequacy of the food supplies. He constantly declared that British difficulties were declining while those of the enemy were augmenting. He welcomed, in April, the entry of the United States into the war as not merely a vindication of the character of the struggle as a great fight for human liberty, but also as an assurance that the war would be effective and successful and would result in a beneficent peace. In her, he said in Oct., the Central Powers had to deal with a country of infinite resources that had never yet been beaten. He set her advent against the defection of Russia, which was a bitter disappointment to him, as he had hailed her revolution as a sure promise that the Prussian military autocracy would, before long, be overthrown, and as he clung, till the establishment of Soviet government in Oct., to the hope that the demoralization of her armies was not beyond repair. Still, although his war plans and those of the Allies, which had been based on the assumption that the Germans would have to retain large forces on the eastern front, were ruined by her cessation of fighting, he could point in Dec. to the number of battles fought during the year on the western front in which the Germans had been beaten, and to the prestige which British arms had won by the capture of Bagdad and Jerusalem.

The critical situation produced by the rapid and victorious German advance in March 1918 called forth all his energy. He had already largely coördinated Allied military operations by means of the Supreme War Council at Versailles; he now, through his colleague, Lord Milner, secured a unity of military command at the front. He sent immediately across to France a large portion of the home defence force—it was complained with some justice that he should have reënforced Sir Douglas Haig with these troops some weeks earlier; he effected a further drastic comb-out from essential industries; he introduced in Parliament a man-power bill of excessive stringency; he sent his most capable and vigorous colleague, Lord Milner, to the War Office; he was urgent with the American authorities to hurry up as many of their troops as possible into the fighting line. The situation was saved, owing mainly to the skilful strategy of Gen. Foch and to the magnificently efficient fighting machine into which Sir Douglas Haig had converted his armies. Accordingly, Mr. Lloyd George could assure the Empire, in a message on the fourth anniversary of the war in Aug., that although the battle was not yet won, yet, thanks to the extraordinary bravery of all the Allied armies, the prospects of victory had never been so great. All that was wanted was to "hold fast."

Mr. Lloyd George was reproached by his critics with too great a disposition to encourage and strengthen the various subsidiary fronts, such as Mesopotamia, Palestine, Salonika and Italy, at the expense of the western front, where the struggle must mainly be decided; and in this and other respects to overrule, on questions of what may be called the higher strategy, the decisions of his military advisers. If that be so, he might plead the example of Chatham; and at any rate the eventual and dramatic success of what were called derisively "side-shows" contributed not a little to the downfall of the Central Powers. He was also charged with reducing his colleagues to ciphers, and acting as a dictator rather than a first minister. The loyalty with which he was served by eminent men who had been formerly in sharp antagonism to him is sufficient to show that his colleagues recognized that he assumed no more authority than was inevitable when the State was in danger. But undoubtedly the system of a Supreme Council of the Allies represented by their Prime Ministers, which he helped to establish in war and which continued for a while in peace, tended to enhance his authority and position, and in particular to reduce the importance of his Foreign Minister. Moreover, it was impossible for him and his colleagues not to realize that it was preëminently in him, after Lord Kitchener's death, that the British nation and Empire trusted to bring them safely through the war. He never contemplated, or allowed the country to consider conceivable, any other termination of the war than a fight to a finish. He would not palter either with any of the insincere or inadequate German overtures, with President Wilson's early formula of "peace without victory," with the Russian phrase "no annexations and no indemnities," or with Lord Lansdowne's negotiated peace; he insisted on eliminating the doctrine of the "freedom of the seas" from President Wilson's Fourteen Points. He steadily pressed for the war aims originally laid down by Mr. Asquith, though, an idealist himself, he expressed them in terms agreeable to idealists, such as President Wilson and the loftier spirits among the Labour men. On the publication of Lord Lansdowne's letter he made his position clear. It was not the extreme pacifist, he said, who was the danger, but the man who thought there was a halfway-house between defeat and victory. To end a war entered upon to enforce a treaty, without reparation for the infringement of that treaty, merely by entering into a new and more comprehensive treaty, would indeed be a farce in the setting of a tragedy. "To stop

short of victory," he wrote in Aug. 1918, "would be to compromise the future of mankind." He was as good as his word. Hostilities were closed with each of the enemy allies in succession—Bulgaria, Turkey, Austria-Hungary and Germany—by what was virtually a surrender, and a surrender on terms implying severe defeat. It was in keeping with the character of a man who, a lay preacher himself, regarded the war as a sacred, religious duty, that, after reading the terms of the Armistice from his place in the House of Commons on Nov. 11, he should ask Parliament to come, with Chancellor and Speaker at their head, to render thanks to God at St. Margaret's.

In spite of his bitter partisan sallies in the past, Mr. Lloyd George was a great conciliator, as he showed over and over again both in his dealings with Britain's Allies, and in his interventions in Labour disputes; and therefore it is not unnatural that he should appreciate highly the value of government by Coalition. Owing to it he had the satisfaction, even during the war, of promoting social welfare by means of a comprehensive Education bill; and of settling on a wide basis the question of reform, including the extension of the franchise to women—an extension of which he was always a warm advocate, though the militants had, in the past, unfairly flouted him as a renegade. It was his firm belief that by Coalition it would be possible to settle the Irish question. The convention which he set up in 1917 gave hope of success but its report was not sufficiently unanimous; and his vacillation in first promising, and then refusing, to introduce a Home Rule bill after the convention in 1918, together with his attempt to force conscription upon Ireland, contributed to the spread of Sinn Fein disaffection; though there was a plausible justification at the time for each of his actions. Coalition also helped towards that great constitutional development of the Imperial War Cabinet, with its corollaries of imperial preference and conservation of the essential raw materials of the Empire, for which, even apart from the war, Mr. Lloyd George's Ministry will always be honourably remembered.

Hence, when a general election, long overdue, and now rendered inevitable by the passage of a reform bill, was impending on the termination of hostilities, Mr. Lloyd George, with the cordial assent of Mr. Law, determined to maintain the Coalition, and to ask the country to return candidates pledged to support the Government in the negotiations of peace and in the problems of reconstruction that must immediately arise. As he wrote to Mr. Law, the Government had had a unity both in aims and in action which was very remarkable in a Coalition Government. This was, it may be pointed out, the less surprising, as the platform of social reform united Mr. Lloyd George and his followers among the Liberals not merely to the moderate Labour leaders but to Mr. Law and the great majority of his party, who inherited the Disraelian tradition of *Sybil* and of the social measures of the 1874 Government. It was a policy of this character that the joint leaders put forward in their manifesto, and they invited candidates who agreed with their aims to pledge them their support. This was surely not unreasonable, as they could not rely upon organized parties; but the Liberals who followed Mr. Asquith, and the Labour party as a whole, though they both claimed independence of the Coalition and stood practically as opposition candidates, denounced the practice as unfair, and nicknamed the pledge a "coupon." The result was an overwhelming vote of confidence in the Coalition, and the absolute rout of the pacifists, the discomfiture of Mr. Asquith and the Liberals who refused to follow Mr. Lloyd George, and the comparative failure of an ambitious effort by the Labour party.

This enormous majority gave Mr. Lloyd George a position of exceptional strength and authority at the Peace Conference of 1919 at Paris, which he attended as the principal British plenipotentiary. He established a new precedent by taking to the conference with him not merely some of his principal colleagues, but also the Prime Ministers and other representatives of the Dominions and of India; who, as representing peoples whose fighting strength had contributed materially to the victory, were obviously entitled to have their share in arranging terms of peace and to sign the treaty ultimately agreed upon. At the conference he was one of three principal figures, along with President Wilson and M. Clemenceau; and his remarkable powers of conciliation were often required to harmonize the very divergent points of view of these eminent men. He strongly supported the President's idealistic scheme of a League of Nations, having himself always regarded the war as one to end war. At the same time he sympathized with M. Clemenceau's resolve to obtain security for France, though he refused to consent to the annexation, with that object, of German populations, either to France herself or her *protégé*, Poland. But he was ready to protect France in another fashion by signing along with President Wilson a separate Treaty of Alliance with her, whereby Great Britain and the United States agreed to come to her assistance in the event of an unprovoked attack on her by Germany. The agreement with England was, however, only to come into force after the ratification of that with the United States—a ratification which was never accorded. He insisted also on German disarmament and German reparations—which latter should only be limited by German ability to pay. Further, he pressed for the due trial of war criminals, and, among them, for that of the most responsible of all, the Emperor William. He signed the Treaty of Versailles on June 28, and obtained its prompt acceptance by the House of Commons. The King in Aug. conferred on Mr. Lloyd George the Order of Merit in recognition of his preëminent services, "both in carrying the war to a victorious end and in securing an honourable peace."

But the signing of the treaty with Germany, and of the treaties with the other enemy Powers, by no means settled finally the issues between the Allies and their late foes. Mr. Lloyd George had on frequent occasions in the next two years to attend meetings of the Supreme Council at Paris, San Remo, Spa, Lympne and occasionally in London, in order to deal with difficult questions arising—to take a few of the most critical points—now out of the provisions relating to German reparations or disarmament, now out of those providing for the future of Silesia. In regard to some of these matters the points of view of France and Britain were so different that even Mr. Lloyd George was hard put to it to find an acceptable formula; and in regard to Silesia he dexterously managed in the summer of 1921 to avoid an open breach by referring the whole matter to the League of Nations. One provision of the Treaty of Versailles, which both Mr. Lloyd George and the British public considered important—namely, that which provided for the trial of Emperor William—proved abortive; as the Government of the Netherlands maintained its right of asylum, and refused to surrender him to the Allies. One foreign question, indirectly connected with the treaty, occasioned Mr. Lloyd George great trouble. He strongly condemned the Soviet Government of Russia, and the principles upon which it was based; but he gradually extricated British troops from their commitments to various Russian generals who were waging civil war upon it; and, as it established its position, yielded to the desire of the Labour party for the reopening of trade with Russia, but on the conditions of a release of all British prisoners and a cessation of foreign revolutionary propaganda.

The immediate prospect of the Peace Conference in Paris and the probability that international complications arising out of the war and of the peace would necessarily weigh heavily on the Prime Minister for many months, if not years, caused Mr. Lloyd George, when he made a partial reconstruction of his ministry after the general election, to continue the arrangement by which Mr. Bonar Law led the House of Commons. But, after the close of the conference, he himself was more frequently in his place in Parliament than during the last three years; and the rank and file after a while began to question whether this war arrangement should not come, with other war arrangements, to an end. On this point, however, Mr. Lloyd George remained firm; though he gratified constitutionalists by restoring, after the Treaty of Versailles, the old form of Cabinet Government, only with the addition of a permanent secretariat.

His principal domestic preoccupations during the years immediately following the peace were the industrial unrest, which continued with practically no intermission for two years and a

half, and which demanded, again and again, his personal intervention; the social reforms promised in the joint manifesto, which were to make Britain, in his own words, "a land fit for heroes to live in"; the difficulties of finance and of controlling the extravagant expenditure which war habits had generated; and finally the settlement, if possible, of Ireland and the Irish question. He laid down his policy on the labour upheaval in the debate on the Address in 1919. The Government would welcome a general investigation into the whole causes of industrial unrest; one individual trade could not be considered without reference to the rest. A great increase in some essential ingredients like coal or transport might easily destroy the chances of restarting British export industry. Every demand which was put forward by any body of workmen would be examined fairly and carefully by the Government with the view of removing any legitimate grievance; but the Government were determined to fight Prussianism in the industrial world, as they had fought it on the continent of Europe, with the whole might of the nation. He had at once to deal with a threatened strike of coal-miners, and his was the energy which promptly set up the Sankey Commission to avert a coal-miners' strike in the early spring of 1919, and got the Commission to issue a preliminary report in three weeks. He sought also at once a wider remedy. He called an Industrial Conference of masters and men, and persuaded it to set up a provisional joint committee. He addressed this body at its first meeting, terming it a peace congress, and saying that with so much of the world in pieces, Britain might have to save civilization. It was necessary to find the legitimate boundary between wages and hours on the one side and adequate production on the other. The huge war debt must be met by saving or by increasing productivity. Employers and workmen should come to an understanding by some sort of dead level of talk. Though the committee came to an agreement on the basis of a legal 48-hour week, minimum time rates of wages of universal application, and the creation of a permanent industrial council, half masters half workmen, to advise the Government on industrial questions, the article on ENGLISH HISTORY shows that this well-intentioned effort was of no avail to calm the unrest.

To take one or two instances of his methods. Of the railway strike in Aug. 1919 he said that he could recall no strike entered into so lightly, with so little justification and with such entire disregard of the public interest. He pointed out that the State was running the railways at a loss due mainly to the enormous increases in the wages of railway workers since the beginning of the war. He took strong measures and succeeded in stopping the strike after 10 days, though promising hardly any further concession than was previously offered. He declined absolutely to adopt the final report of the Sankey Commission and concede the nationalization of the coal industry. The Government had never, he said, committed themselves blindfold to whatever the Commission might recommend, and they had definitely decided that they could not undertake the State management of the mines. In the great coal dispute of the autumn of 1920, he insisted that there must be guarantees as to output before there could be an advance of wages, and that wages and output must advance together. He treated the refusal of Irish railwaymen in that year to carry munitions of war, which was backed in a half-hearted way by the English railwaymen, as a challenge to the whole constitution of the country and was prepared to close the Irish railways rather than submit.

A speech which he delivered at the City Temple on Sept. 17 1919 shows his general views of reconstruction. He appealed for brotherhood between nations and brotherhood between classes. He sketched in broad outline the fundamental changes which he wished to see in the political, social and industrial conditions of the United Kingdom. Slums would have to go, and he hoped that the great armaments would disappear, as also the wretched misunderstandings between Ireland and the rest of the United Kingdom. He looked forward to seeing waste in every shape and form disappear. But these changes could only be effected by patient work, in the spirit of comradeship of classes, a passionate desire to see justice done to all classes. He pleaded not only for the League of Nations, but for fair play between employers and employed. If workmen merely considered how much they could extort from employers at the cost, perhaps, of the community, or if employers only asked at how low a price they could buy off labour, the result would be disastrous. In this spirit, while prices were high and the fictitious boom in trade born of war was still in existence, he started the Ministry of Health and the Ministry of Transport on large lines, encouraged Dr. Addison in a great housing scheme, for the reason that, as he said, adequate housing would make happy homes, which were the surest guarantee against agitation and unrest; he promoted legislation guaranteeing a minimum price of wheat and security of tenure to the farmer, and a minimum wage and better hours to the labourer; and he encouraged Mr. Austen Chamberlain to continue to lay the same, or greater, burdens on the taxpayer in peace, as that patriotic citizen had borne in patience during war.

Then in the late autumn of 1920 there came without warning a sharp depression in trade, and prices suddenly fell. This at once rendered acute the question of expenditure about which there had been many sporadic protests already. Mr. Lloyd George pointed out that the depression was universal, that it was desirable to remove Government control from trade as soon as possible, and that public and private economy were necessary on the strictest lines. He had already addressed a strong letter to the spending departments, but with little result; and in the previous year he had pointed to armaments as the only item on which considerable reductions could be made. But the public thought that there were other possibilities of reduction, especially in the grandiose schemes of Mr. Fisher, Dr. Addison and Sir Eric Geddes, the Ministers of Education, Health and Transport. This opinion was forcibly brought home to Mr. Lloyd George in the spring of 1921 by the rapid growth of an "Anti-Waste" party, unaffiliated to any of the historical connexions, which defeated Government candidates in by-election after by-election; and by the formation of a growing "cave," in the ministerial ranks, of members who announced that they held themselves free to vote against the Government on questions of expenditure. Reluctant as Mr. Lloyd George, always a social reformer rather than an economist, was to abandon his cherished policy, he recognized that it was necessary to bow to public opinion. The greater part of Mr. Fisher's scheme was postponed; Sir Eric Geddes reduced the dimensions of his railway bill; Dr. Addison's proposals were so mutilated that he resigned; the agricultural policy was reversed; the abandonment of control of mines was advanced by four months in order to save the subsidy, and incidentally the greatest strike of recent times was precipitated. But the movement for a severe reduction of expenditure still gathered force.

There was nothing nearer to Mr. Lloyd George's heart than to effect an Irish settlement, and he carried through Parliament in 1919–20 a Home Rule bill creating two self-governing Parliaments, one at Dublin and one at Belfast, with a Federal Council as a link between them making for the unity of Ireland. He explained to Parliament that the measure rested on three basic facts:—(1) three-fourths of the Irish people were bitterly hostile and rebels at heart; (2) N.E. Ireland was alien in race sympathy and tradition from the rest; (3) severance of the United Kingdom and Ireland would be fatal to both. The first of these facts was abundantly illustrated in 1919–21. The Sinn Feiners of the south kept up a ruthless campaign of assassination against soldiers, police and well-affected civilians, sparing neither age nor sex. Mr. Lloyd George reënforced both soldiers and police, and backed them up strongly, even palliating unauthorized and severe reprisals which newly recruited police without sufficient discipline committed during several weeks. But though he assured Parliament and the public, at intervals, that he had murder by the throat, the campaign was still continued; and Sinn Fein held such a control of southern Ireland that it captured in 1921 without contests the whole of the seats for the southern Parliament except those allotted to Trinity College, and then its members refused to come and take the oath. But the northern Parliament, where the Unionists had a large majority, was

opened with great *éclat* in the spring by the King in person, who adjured Irishmen to "forgive and forget." The words chimed in with a great yearning in the public mind for peace. Mr. Lloyd George seized the occasion, asked Mr. De Valera, the Sinn Fein leader, and Sir James Craig, the Ulster Prime Minister, to come and see him, and a truce to bloodshed was arranged pending negotiations. Mr. Lloyd George's subsequent offer of "Dominion Home Rule," with certain safeguards, the Sinn Fein rejections of it during August and September, and its acceptance in December, are dealt with in the article on IRELAND.

Mr. Lloyd George also held further sessions in the summer of 1921 of the Imperial Cabinet, or Conference, as some prefer to call it. The decisions mainly affected the treaty with Japan, the renewal of which was approved, and the Pacific question. While the Dominion Premiers were still in session with British ministers in London, President Harding issued an invitation to a Conference on Disarmament at Washington, which was accepted. The Imperial Cabinet suggested a preliminary Pacific Conference which the Dominion ministers might attend, but the United States would not agree.

Mr. Lloyd George lost in the early spring of 1921 two valuable colleagues, Lord Milner and Mr. (afterwards Lord) Long; and he suffered a still greater loss in the sudden break-down in health of his partner in Government, Mr. Bonar Law, with whom his relations had been peculiarly intimate and cordial. But he arranged that the newly elected Unionist leader, Mr. Austen Chamberlain, should occupy exactly the same position as his predecessor. He was as convinced of the necessity of Coalition as ever, though there were some signs of disaffection on both wings, and the "Anti-Waste" movement was proving a disintegrating force. His own astounding vitality appeared to have suffered no diminution. There was no sign of weariness or lack of grasp in his prompt action after the King's speech at Belfast, in spite of the fact that he had been uninterruptedly in high office for nearly 15 years, had been in the forefront of political strife almost the whole time, had carried the country with safety and success through the greatest war in history, and had survived an amount of abuse from different quarters that would have crushed any but a very exceptional personality. Though public confidence in him was not so general in the summer of 1921 as it had been at the close of the war, no statesman had yet arisen who could seriously be put in competition with him for the post of Prime Minister. (G. E. B.)

**LOCHEE OF GOWRIE, EDMUND ROBERTSON,** BARON (1845–1911), British jurist and politician. Born in Scotland Oct. 28 1845, and educated at Oxford, he became a fellow of Corpus Christi College in 1872; he was called to the English bar, and became well known as a jurist, filling the posts of examiner in jurisprudence at Oxford, professor of Roman law at London University, and reader in law to the council of legal education. He was Liberal member for Dundee from 1885 until he was raised to the peerage in 1908. In 1892 he became a civil lord of the Admiralty, and in 1906 was secretary to the Admiralty. His writings include a book on *American Home Rule*, and numerous articles on legal and constitutional subjects in the *E.B.* He died at Canterbury Sept. 13 1911.

**LOCKE, WILLIAM JOHN** (1863– ), English novelist and playwright, was born March 20 1863 in Georgetown, Demerara, the eldest son of John Locke of the Colonial Bank Service. He was educated at Trinidad and St. John's College, Cambridge. On leaving the university he became a schoolmaster until in 1897 he was appointed secretary to the R.I.B.A. He became a corresponding member of many European architectural societies; but it is as a writer of novels that he is best known. Of these the chief are: *At the Gate of Samaria* (1895); *Where Love Is* (1903); *The Morals of Marcus Ordeyne* (1905); *The Beloved Vagabond* (1906); *Stella Maris* (1913); *The Wonderful Year* (1916); *The Rough Road* (1918); *The House of Baltasar* (1920) and *The Mountebank* (1921), several of which have been reproduced on the film. Besides original plays, such as *Mr. Cymic* (1899), *The Lost Legion* (1909) and *The Man from the Sea* (1910), he dramatised *The Morals of Marcus*, produced at the Garrick theatre (1906), and *The Beloved Vagabond*, produced at His Majesty's theatre (1908).

**LOCKROY, ÉDOUARD** (1838–1913), French politician (*see* 16.854), died Nov. 22 1913.

**LOCKWOOD, WILTON** (1861–1914), American painter (*see* 16.855), died at Brookline, Mass., March 20 1914. In 1912 he was elected a member of the National Academy of Design.

**LOCKYER, SIR JOSEPH NORMAN** (1836–1920), English astronomer (*see* 16.855), died at Sidmouth Aug. 16 1920. In 1912 he became president of the British Science Guild, which owed its existence to a suggestion made by him in his presidential address to the British Association in 1903.

**LODGE, HENRY CABOT** (1850– ), American statesman and author (*see* 16.860), as a member of the Committee on Foreign Relations of the U.S. Senate supported (1914) the repeal of the Panama Canal toll exemptions clause as desired by President Wilson. Although he believed that under the Hay-Pauncefote Treaty the United States had full right to discriminate in favour of American shipping, he felt that a mistake had been made in refusing Great Britain's request for arbitration of the question. He was opposed to woman suffrage and in Aug. was "blacklisted" by the National American Suffrage Association. In Jan. 1915 he opposed the ship purchase bill for the acquisition of shipping which the President had asked Congress to pass, on the ground that it would lead to endless foreign complications because of conditions arising out of the World War. In Feb. he also opposed the treaty negotiated by Secretary Bryan with Colombia, in which it was proposed to pay Colombia $25,000,000 and to express regrets for incidents attending America's recognition of the independence of Panama and acquisition of the Panama Canal Zone. He construed this as a criticism of the administration of President Roosevelt when the Canal Zone was acquired. In 1916 he assailed the suggestion of an American embargo on arms, declaring that such action would place America on the side of the Central Powers. In Jan. of the same year he offered a resolution calling for armed intervention in Mexico. He was an unpledged delegate-at-large from Massachusetts to the Republican National Convention, 1916, and served as chairman of the Committee on Resolutions. The same year he was elected vice-president of the American Society of International Law. In July he supported the navy bill, calling for an appropriation of $315,000,000, and declared that America needed a fleet both in the Atlantic and Pacific oceans as the Panama Canal was "vulnerable." In Oct. he publicly charged that the President had added a "postscript" to the second "Lusitania" note, informing the German Government that the strong words in the first note were "not to be taken seriously" and had withdrawn it when members of the Cabinet threatened to resign. Later he accepted, somewhat perfunctorily, the President's denial of such action. He opposed prohibition and urged moderate taxation of individual incomes and of excess war profits of corporations. In 1918 he opposed the Overman bill, bestowing special war powers on the President, on the ground that it might lead to autocracy. Senator Lodge had long been a sharp critic of President Wilson's policies and his antagonism became more personal after the meeting of the Peace Conference. In Dec. 1918 he advocated postponement of the question of a league of nations until after the signing of the treaty, insisting that the two should be considered separately. In the same year he was elected Republican floor leader of the Senate and, as such and as chairman of the Foreign Relations Committee, his position was one of great influence. When the President submitted to the Senate the Treaty of Peace, Senator Lodge became the leader of the opposition. He assailed the President for usurping power and ignoring the Senate whose responsibility in the matter, he declared, was as great as the President's. Under his leadership 14 reservations were carried through the Senate, "all designed to protect the safety, independence and sovereignty of the United States. They did not nullify the treaty. They simply Americanized it"; these, he maintained, constituted the irreducible minimum which the President must accept, if the treaty was to be ratified

by the Senate. The President refused to accept the reservations, a prolonged deadlock ensued, ending in rejection of the treaty as submitted by the President. At the Republican National Convention in 1920 Senator Lodge served as permanent chairman. He was one of the four U.S. delegates at the Washington Conference on the Limitation of Armament, in 1921.

**LODGE, SIR OLIVER JOSEPH** (1851– ), English physicist (*see* 16,860). Subsequently to 1910 Sir Oliver Lodge became increasingly prominent as a leader in psychical research and a strong believer in the possibility of communicating with the dead. Amongst his later publications are *The Survival of Man* (1909); *Reason and Belief* (1911, 3rd ed.); *The War and After* (1915); *Raymond, or Life and Death* (1916), a memoir of his son killed in the World War, with an account of communications thought to have been received from him since; *Christopher: a Study in Human Personality* (1918), etc. In the early part of 1920 he made an extensive lecturing tour in the United States, having just previously retired from his post as principal of the university of Birmingham.

**LODZ-CRACOW, BATTLES OF, 1914.**—Under this heading an account is given of the offensive operations of the Central Powers in the eastern theatre of war in Nov. 1914, succeeding the Vistula-San battles, which had ended in their retreat through Poland and West Galicia to the verge of Silesia. The battle-front was enormous, extending as it did from the country N. of Warsaw, across western Poland and past Cracow into the Carpathians. But this front was held in very unequal density, and, in this event, the execution of the general plan led to the focussing of the German operations upon the manufacturing town and rail centre of Lodz, while the Austrian centre of gravity lay at and to the S. of Cracow.

Having decided to break off the battles of Warsaw and Ivangorod, the Central Powers instantly formulated a new plan of campaign, regrouping their troops and placing them in readiness for a new offensive. The Russian IV. and IX. Armies had kept in touch with the Austro-Hungarian I. Army after the battle of Ivangorod, but the Russian I., II. and V. Armies soon lost all contact with Hindenburg's army, owing to his rapid retreat and the destruction of all communications. By Nov. 3 these three armies had reached the line Kovel (Kowel)–Klodawa–Uniejow–Zdunska Wola–Belchatów–Checiny, where they lay without attacking until Nov. 8. It may be assumed that the Grand Duke Nicholas left them in this section to recover and prepare for a great new offensive through Silesia into the interior of Germany.

The Russian III. and VIII. Armies pursued the Austro-Hungarian Armies very cautiously in their retreat in Galicia, while the Russian XI. Army was being formed under Lt.-Gen. Selivanov for the second siege of Przemysl.

Hindenburg, who on Nov. 1 had taken over the supreme command of the whole German E. front, resigning the command of the IX. Army to Gen. von Mackensen, commander of the XVII. Corps, proposed to meet the Russian attack by sending the German IX. Army from the Silesian frontier by train to the Posen–Thorn area and pushing off the German I. Corps and XXV. Res. Corps of the German VIII. Army—then fighting in East Prussia—to meet it there.

With this force—consisting of 5½ corps and 2 cavalry divisions—he intended to make an enveloping attack on the Russian I. Army, which was advancing on the N. wing, and to entrust the direct protection of the Silesian frontier to Landsturm formations, the Posen and Breslau garrisons, Frommel's newly formed cavalry corps (German 5th and 8th and Austro-Hungarian 7th Cavalry Divs.) and Gen. von Woyrsch's army detachment, consisting of 3 infantry divisions which had been left in the area of Czenstochowa and Zarki.

On the right bank of the Vistula Zastrow's German corps, consisting of the war garrisons of the Vistula fortresses and of Landsturm, was to simulate a strong attack on N. Poland from Soldau, while the main reserve of the Thorn fortress pushed forward up the Vistula towards Plock (Plotsk).

The Austro-Hungarian I. Army, having the Cracow fortress as a support for its S. flank, had by Nov. 8 established itself on the line Zarki–Komoléw–Bydlin–Proks–Krzeszowice. In conjunction with Woyrsch's army, which was under the Austro-Hungarian Army Higher Command, it was to intercept the expected impact of the Russian IV. and IX. Armies. The Austro-Hungarian IV. Army was to join up with the I. Army, cross the Vistula either within or to the E. of the Cracow fortress area on Nov. 10 or 11, according to the stage reached in the battle, and fall on the flank of the Russian IX. Army attack. The S. wing of the I. Army was to join in this attack at discretion.

In Galicia no important Russian offensive was expected in the near future. Confirmation of this view was provided by the very slight pressure exercised upon the retreating Austro-Hungarians by the Russian III. and VIII. Armies, and also by some intercepted radio telegrams. On the one hand, the Russians were exhausted after the heavy fighting on the San and the successful attacks by the II. and III. Austro-Hungarian Armies at Chyrow; on the other, the siege army raised for Przemysl had absorbed a large part of their mobile forces.

In case of an attack, the Austro-Hungarian Army Higher Command intended to answer by a counter-advance in western Galicia—in touch with the IV. Army—and on the Carpathian ridge. This it hoped to be in a position to carry out even after the original front had been weakened. In the Silesian frontier defence, N. of Woyrsch's army, there was a large, inadequately defended gap which the German Supreme Command ardently desired to see filled. The Austro-Hungarian Army Higher Command therefore withdrew the II. Army Command with the IV. and XII. Corps from the front, added a Hussar regiment, and sent them all by train through Silesia to Woyrsch's N. wing, to be placed under his command. In the deployment area this army was also joined by Hauer's cavalry corps, consisting of the 2nd and 9th Cav. Divisions.

The remaining army groups of the II. Army—including the VII. Corps, 17th and 34th Infantry Divs., 38th Honved Infantry Div., 1st, 5th and 8th Cav. Divs., 103rd and 105th Landsturm Bdes., and the 1st, 2nd and 17th Landsturm territorial brigades—were placed under the III. Army Command and, in conjunction with this army, had to prevent a Russian advance over the Carpathian ridge. The direct protection of western Galicia was left to the XI. Corps (Field-Marshal-Lt. von Ljubičić).

In Oct. an army group was formed under Gen. von Pflanzer in order to defend the eastern Carpathians and drive the Russians out of Austria-Hungary. On this group fell the task of defending the Carpathians E. of the Verecke pass, and of protecting the reconquered portions of Bukovina.

In accordance with this plan of operations big battles now developed, during Nov. and Dec., in Russian Poland, at Cracow in western Galicia, and on the Carpathian ridge.

Mackensen's attack on the Russian I. and II. Armies led to the two battles of Lodz (Nov. 17–Dec. 15), the Austro-Hungarian IV. and I. Armies' operations to the battle of Cracow (Nov. 12–26), to which was added in Dec. the battle of Limanowa-Lapanow in western Galicia (Dec. 3–12).

In the second half of Dec. a Russian counter-offensive set in, leading to the battle of Jaslo.

*First Battle of Lodz (Nov. 17–Dec. 1).*—The advance of the German IX. Army from the Thorn–Posen area between the Warta and the Vistula began on Nov. 11. On the N. wing the XXV. and I. Reserve Corps advanced on Wloclawek, the XX. Corps and the 3rd General Reserve Div. from Hohensalza on Kutno, the XVII. Corps from Gnesen through Kolo towards Leczyca, and the XI. Corps from Wreschen (Wrzesznia) through Konin towards Dabie.

Before the front a screen was provided by von Richthofen's cavalry corps—formed from the 6th and 9th Cav. Divs.—which had been brought up from the W. and was driving back the Russian cavalry through Lubomin and Blem. In the space between the XI. Corps and Gen. Woyrsch's N. wing the formation of the Posen and Breslau corps was screened by German Landsturm and by Frommel's cavalry corps, which had been winning battles against Novakov's Russian cavalry corps.

Frommel's corps had to push forward on Lodz, the Posen corps on Sieradz and Lask. The Breslau corps was not yet ready.

It was anticipated that the II. Army would come in by the middle of Nov. from the area N. of Czenstochowa, and that towards the end of the month 8 German divs., released by the breaking-off of the Ypres battle, would have come up by train. The Zastrow corps and the Westenhausen brigade of the Thorn fortress garrison had also begun to advance on Nov. 11, the Zastrow corps being reënforced by Hollan's cavalry corps (2nd and 4th Cav. Divs.), likewise brought from the west.

The Russian I. Army had on Nov. 9 advanced its front to Wloclawek. The rest of the front remained more or less stationary. Their preparations were apparently not complete. They also assumed the German and Austro-Hungarian forces to be so thoroughly beaten that they could begin the offensive at their leisure. Their great distance from the drafting base, too, made very thorough preparations essential.

On Nov. 12 the German N. wing came up against the Russian front quite unexpectedly on the line Wloclawek–Lubraniec. After a brief but heavy battle, the Siberian V. Corps and the Russian 79th and 50th Divs. were overthrown, Wloclawek taken, and the Russian I. Army forced to retreat to the line Plock–Gostynin–Kutno–Ozorkow, where it established itself afresh, prepared for a stubborn resistance. To withdraw from this position would mean losing the Vistula crossing at Plock, and with it the possibility of bringing the corps on the N. bank of the Vistula over to the S. bank by the shortest way. On the 15th Mackensen overran this line also. In the battle of Kutno on Nov. 16 the resistance of the Russian I. Army was broken, and it withdrew to a sort of bridgehead position S. of Plock. Mackensen left only the one reserve corps under Lt.-Gen. von Morgen to protect him in rear against the Russian I. Army, and pushed forward with his main force on the line Leczyca–Lowicz.

The Russian situation had become critical, for the I. and II. Armies had been torn apart. As the right wing of the II. Army was in danger of being surrounded, the Grand Duke Nicholas led the army back to the line Strzykow–Lutomirsk, which it reached on the evening of Nov. 17. Here, together with the IV., II. Siberian and XVII. Corps and the I. Corps, brought up to the right wing from Lask, it was to intercept Mackensen's blow, aimed in the direction of Lodz. The Russian V. Army, consisting of the XIX., V., I. and IV. Siberian Corps, was also brought up, instead of being sent to march towards Silesia, as was originally intended. At the same time the advance of the Russian corps still engaged on the right bank of the Vistula was diverted towards Plock, Wyszogrod and Warsaw for the purpose of making a thrust at Mackensen's left flank.

On Nov. 17 the German corps crossed over the Lowicz–Leczyca line, and, after the Russian II. Army's right wing had been thrown back on Brzeziny, and Brzeziny itself had been taken by the XX. Corps on Nov. 19, advanced concentrically on Lodz. As in the meantime Lask had been taken by the Posen corps, a close ring was, on the 20th, formed round the Russian II. and V. Armies, consisting of 14½ divisions, which stretched in a long course of 90 km. from Tuszyn through Bukowiec, Nowosolna, Lutomirsk and Lask to Grebuszow, leaving only a gap of 20 km. open to the south-east.

The middle of Nov. also saw the beginning of the enveloping attack on Nowo-Radomsk by the IV. Army, Woyrsch's army and Böhm's army, by which the Russian IV. and IX. Armies were prevented from sending any of their forces to the dangerously situated Russian II. and V. Armies.

On the 21st, when Mackensen's victory over these two armies seemed to be assured, there arrived Russian reënforcements, coming from Lowicz and Warsaw by way of Skiernewice, which pressed forward on the German rear up to Brzeziny.

Although Plock had fallen on Nov. 11, and Gen. von Morgen, who had fetched the main reserve of the Thorn fortress garrison across the Vistula for his own use, was holding out against the numerically superior Russians, the diversion of Russian forces to Lodz could not be prevented.

To repulse the Russian forces advancing from Warsaw and Skiernewice (the II. Corps, 55th Infantry Div., Russian 5th and Caucasian Cav. Divs.) Richthofen's cavalry corps, the Guard Reserve Division and the XXV. Res. Corps reversed their front. The German ring had to be opened. On the 23rd the right wing fell back on Zdunska Wola, the left on Nowosolna. When the XX. Corps gave way on Nov. 24, the XXV. Res. Corps, with the 3rd Guard Res. Div. and Richthofen's cavalry corps, became cut off and surrounded by the triumphant Russians, who had trains in readiness for transporting their prisoners. But in the night of the 24th–25th, Lt.-Gen. Schäffer-Boyadel, commanding the XXV. Res. Corps, succeeded by means of a vigorous attack in breaking through to the N. and joining up with the left wing of his own front, taking with him all the surrounded units and 10,000 prisoners.

The effort to encircle the two Russian armies had not succeeded, and the hope of annihilating the Russian armies in the bend of the Vistula had therefore once more to be deferred.

By the end of November, after the arrival of the Schäffer-Boyadel group, Hindenburg had organized a strong connected front on the line Dobrzyków–Zychlin–Piatek–Zgierz–Szadek–Zdunska Wola–Widowa–Rusiec, at which point a junction was made with Böhm's army. Against this front the Russians battered in vain.

Meanwhile in the latter half of November the battle of Cracow was being fought N. of Cracow and E. of Czenstochowa.

*Battle of Cracow.*—At the Austro-Hungarian Army Higher Command the attack by the Russian V., IV. and IX. Armies was expected on Nov. 15 on the front of Woyrsch's and Dankl's armies. Woyrsch was to hold his own position at all costs, and to échelon Böhm's army in rear of his N. wing for a subsequent counter-attack. Dankl's army was also to maintain its front and be ready on the morning of Nov. 16 to advance to the attack from its N. wing in conjunction with the Archduke Joseph Ferdinand's army.

The Archduke was instructed to execute a surprise assault on Nov. 16 on the flank of the attack which the Russian IX. Army was expected to deliver on Dankl's army front. To this end one group—consisting of the XIV. Corps, with 4 infantry divisions, under Field-Marshal-Lt. Roth—was to attack by way of Pietrzejowici; a second group—the VI. Corps, with 2 infantry divisions, under Field-Marshal-Lt. von Arz—was to attack at Slomniki; the XVII. Corps was to be in readiness at Wieliczka to gain the N. bank of the Vistula at Niepolomice and Szczurow on the 17th, and to join in the attack by Field-Marshal-Lt. Roth's group. On Nov. 16 the line Nowo Brzesko–Prossowice–the heights E. of Slomniki was to be reached.

In fact, however, the Russian IV. Army came within artillery range of Woyrsch's army and the left wing of the I. Army on Nov. 15. The Russian advance had, it is true, an appearance of great caution, and only minor artillery battles and skirmishes between advanced detachments took place on that day. Still more hesitatingly did the Russian IX. Army advance its right wing to the line Wolbrom–Skala. The left wing was meantime being technically strengthened in the Wawrzencayce–Smardzowice position, facing the Cracow ring of forts, which it had reached on Nov. 14.

Again, on Nov. 16, no particular battles were fought by Woyrsch's army and the deploying II. Army. The right wing of the Russian IX. Army, on the other hand, made a vigorous attack on the Austro-Hungarian I. Corps of Dankl's army, but was repulsed. Neither had the somewhat premature attack by the right wing of Dankl's army (X. and V. Corps) and the whole of the IV. Army any success that day.

On the morning of Nov. 17, the II. Army advanced to the attack with the 35th Reserve Div., while Woyrsch's main body and Dankl's N. wing (consisting of the II. Corps, the Tschurtschenthaler group and the 12th Infantry Div.) were repulsing strong Russian attacks. The right wing of the I. Army gained some ground. The IV. Army came up against strong Russian positions but, towards evening, had managed to work its way up to the heights S. of Gorzyce and to Smardzowice. The XVII. Corps achieved the crossing of the Vistula in the course of the day.

For Nov. 18 the Army Higher Command had ordered an enveloping attack by the II. Army on the right wing of the Russian IV. Army at Nowo-Radomsk, an assault on Szczekociny by Woyrsch's S. and Dankl's N. wing, and the capture of Skala by Dankl's S. wing and the Archduke Joseph Ferdinand—who were also to gain ground in the direction of Proszowice. But this day again brought only partial success. The 16th and 31st Infantry Divs. of the II. Army reached Kocin by dint of heavy fighting, and Hauer's cavalry corps encountered a Russian cavalry division N.W. of Nowo-Radomsk and forced it back.

On the 19th only local successes were obtained. The attacks on the S. wing of the Austro-Hungarian I. Army (X. Corps) by the Russian XIV. Corps were repulsed by the 24th Infantry Div. The X. Corps in the end captured the Russian trenches at Saspow and the N. wing of the I. Army also gained ground. The V. Corps made an enveloping attack in the direction of Jangrot, thus enabling the 33rd Infantry Div. to take the heights N. of the Suloszowa church. The I. Corps and the Tschurtschenthaler group stormed the heights 2 km. W. of Wolbrom and also those E. of Kielkowice and Zerkowice. The II. Corps advanced as far as Lgota Murowana.

In the meantime violent attacks on the Landwehr corps of Woyrsch's army had been made by the Russian grenadier corps, and were only repulsed after the left wing division of the II. Army (16th Infantry Div.) had made its enveloping attack on the line Cykarzew–Kruszyna.

Of the remaining divisions of the II. Army the 35th Infantry Div. reached the area round Miedzno, and the 31st Infantry Div. went as far as Brzeznica. The IV. Army attack made no particular progress, except that the XVII. Corps, attacking just N. of the Vistula, won its way to the Kotowiec hollow.

On Nov. 20 the N. wing of Woyrsch's army made a successful advance. The Prussian Landwehr corps took Radostków and drove back the Russian 1st Grenadier Div. through Mykanów; and the 35th German Reserve Div. under Lt.-Gen. Schmettau, advancing to the N. of the Landwehr corps, also gained ground. In the II. Army the 31st Austro-Hungarian Infantry Div. approached to within about 8 km. of Nowo-Radomsk on both sides of the Brzeznica–Nowo-Radomsk road and Hauer's corps reached Dobryszyce.

On Nov. 21 the Russian grenadier corps opened a strong counter-attack, and forced the 31st Infantry Div. to fall back on Brzeznica. Hauer's cavalry corps was also forced to retire to Wiewiec and Chorzenice. Woyrsch's army front remained as it was; and in the next few days his army went on the defensive, joining up W. of Szczerczow and Widawa with the N. wing of the German IX. Army which, in consequence of the events at Lodz, had also had to be brought back.

Further S., the N. wing and centre of Dankl's army gained a certain amount of ground, but there were no successes worth recording. Neither did the Archduke Joseph Ferdinand's army reap any particular advantages up to Nov. 22. The Austro-Hungarian XVII. Corps did, indeed, drive the left wing of the Russian IX. Army back across the Szreniawa, but the Russian XXI. Corps, which had been fetched over from the S. to the N. bank of the Vistula, prevented any further advance.

*The Russian III. Army at the Battle of Cracow.*—After the fighting on the San and the battle of Chyrow had been broken off, Field-Marshal Ljubičić led the XI. Corps (11th and 30th Infantry Divs.) back through Jaslo and Neu Sandec to join the N. wing of the III. Army. To him and to Field-Marshal-Lt. Nikić's group (consisting of half of the 41st Honved Infantry Div., the 1st and 11th Landsturm Bdes. and the 6th and 10th Cavalry Divs.), which had been assigned to him by the IV. Army Command, the protection of W. Galicia was entrusted. The IV. Army was to deliver the flank assault towards the N. and the main body of the III. Army was to retire to the Carpathian ridge. At the same time Ljubičić was to prevent the withdrawal of any portion of the Russian III. Army to the N. bank of the Vistula.

Of Radko Dimitriev's army, 8 divisions strong, only the XXI. Corps (3rd and 45th Infantry Divs.) and a few cav. divs. had reached Tarnow and the Dunajec up to the middle of November. These were followed, at a great distance, by the cavalry only of Boroević's army. Radko Dimitriev's main body was at Jaslo, Krosno and Dynow.

Screened by the Austro-Hungarian 4th Cavalry Div., the transfer of the XI. Corps to the Brzesko–Tymowa area was completed by Nov. 19. Here Ljubičić proposed to hold up the Russians. If necessary, he would be able to fall back on the Raba, or, possibly, on a position stretching from Kolko through Bloto (E. of Niepolomice), Targowisko and Dobczyce to the Kamienik heights S. of Dobczyce—and finally on a technically prepared position in the Wieliczka–Dobczyce area, where the strongest resistance could be offered.

On Nov. 17 the cavalry were already engaged. At Strzelce the Austro-Hungarian 10th Cavalry Div. drove the Russian 7th Cavalry Div. back towards Rylowa and Borzecin, but were themselves forced to retreat when parts of the Russian 44th Infantry Div. came on to the field at Borzecin. On the S. wing W. of Grybow, actions were fought between the 9th Dragoons of the 14th Cavalry Div. and the Russian cavalry.

On Nov. 18 the advanced guards of the XI. Corps had forced back some Cossack sotnias at Tymowa, and on the 19th the 30th Infantry Div. reached the area E. of Tymbark, the 11th Infantry Div. and Nikić's group the areas E. and W. of Brzesko respectively, while the 5th Cavalry Div. stopped a Russian column advancing from Zacliczyn. The gap of about 80 km. which had been formed between the XI. Corps and the III. Army's N. wing was protected by the 4th Cavalry Div. and a mixed detachment at Neu Sandec and on the Dunajec. But, as the 4th Cavalry Div. was forced by a Russian cavalry corps to retire on Alt Sandec on Nov. 19, the road now lay open on Ljubičić's flank and also in the direction of the IV. and I. Armies' communications. The closing of this gap therefore called for instant attention.

The protection of the area was entrusted to the commander of the 11th Cavalry Div., Field-Marshal-Lt. von Nagy, to whom were allotted the 6th and 10th Cavalry Divs. and also a few auxiliary battalions and the Polish legion.

On learning through a radio telegram that the Russian XXV. Corps had asked the XXI. Corps to come in on both sides of the Vistula, Ljubičić decided to deliver an attack in a N.E. direction, at the same time covering himself against Wojnicz and Zacliczyn, with the aim of preventing the Russian XXI. Corps from attacking on the N. bank of the Vistula.

Radko Dimitriev's intention was to group his army on the Dunajec as soon as possible and let the XXI. Corps go to the help of the hard-pressed IX. Army on the N. bank of the Vistula. The bridging preparations on both sides of the mouth of the Dunajec and numerous intercepted messages pointed clearly to the early execution of this project.

When Ljubičić attacked on Nov. 22 he already encountered fairly strong Russian forces. Nikić went into action at Brzesko with but slight results. The 11th Infantry Div. attacked the Russian XI. Corps E. of Brzesko, while the 30th Infantry Div. engaged a column of the Russian IX. Corps advancing from Tarnow. Heavy battles also took place on Nov. 21 and 22, for Nikić's group and the 11th Infantry Div. had renewed their attacks, in order to delay the Russian XXI. Corps in their crossing of the river. But the Russians had meanwhile brought up the whole of the IX. and XI. Corps, as well as parts of the X. Corps, thus securing the safe withdrawal of the XXI. Corps. If this corps could not be prevented from reaching the opposite bank, however, the Austro-Hungarian Army Higher Command intended that it should at least be harried during the crossing and prevented from taking part in the IV. Army's battle. Ljubičić had therefore hurriedly to transfer Nikić's group to the N. bank of the Vistula, where, in conjunction with the Austro-Hungarian XVII. Corps, it was immediately to advance against the Russian XXI. Corps. Portions of the XI. Corps were also to make preparations to cross over if necessary. But the preparations were not called for, as Radko Dimitriev, on Nov. 23, launched an attack on the whole of Ljubičić's front (the 11th and 30th Infan-

try Divs. and the 1st and 11th Landsturm Bdes.). Although it proved possible to repulse all the Russian attacks—with the exception of one at Brzesko, where an infantry regiment's position was crushed in—and although the Austro-Hungarian troops were offering a most stubborn and enduring resistance, Ljubičić decided, in view of the numerical superiority of the Russians (they had 2 corps, 1 reserve division and 2 cavalry divisions), to retire on Nov. 24 to Bochnia-Muchowka.

On the N. bank of the Vistula, similarly, no real success was achieved. The E. wing of the IV. Army had certainly obtained some fine results up to this point, but a new situation seemed to have been created on the N. bank of the Vistula by the bringing into action of the Russian XXI. Corps, which made furious onslaughts on the Austro-Hungarian XVII. Corps.

Meanwhile the Russians had apparently intended to break through on the inner wings of the I. and IV. Armies at all costs, but all their attacks were in vain. On the S. wing of the I. Army they threw themselves on the V. and X. Corps' front without any result. Von Arz achieved some minor successes with counter-attacks by the IV. Corps on the N. wing of the IV. Army, but was not able to push through to Skola.

When the Russian III. Army came into action on both banks of the Vistula, and particularly when it advanced against Ljubičić on the S. bank with a force more than twice as strong as his, the right flank of the Austro-Hungarian IV. Army seemed to be dangerously involved. There were already 2 corps fighting against Ljubičić, and 2 divisions of the Russian X. Corps were still coming up. Should Ljubičić be forced to retreat, a repercussion on the right wing of the IV. Army was inevitable.

In the meantime Brussilov had pressed hard upon Boroević's army in its retreat to the Carpathian ridge, and the Russian XXIV. Corps had pushed forward on Homonna.

The danger attaching to Radko Dimitriev's advance led the Austro-Hungarian Higher Command to decide definitely on a new plan of operations. Ljubičić's group was in no case to be exposed to a check, but was to yield gradually to the Russian pressure and fall back on the last-prepared position—Wieliczka, Dobczyce and the Kamienik height. In accordance with this retreat the Archduke Joseph Ferdinand was to take back Kritek's (17th) and Roth's (14th) groups, which were heavily engaged on the right wing, and Arz's group was to refuse its flank. The consequent shortening of the IV. Army's front, however, enabled Kritek's group to move back to the S. bank of the Vistula, thus placing Ljubičić's group in a position to offer an obstinate resistance on the line mentioned.

Up to this point the decision had been sought N. of the Vistula, but Conrad von Hötzendorf, whose one anxiety had been to resume the offensive, now planned a blow to be delivered from the S. against the left flank of that part of the Russian III. Army which was advancing against Ljubičić.

This flank attack was to be carried out by the XIV. Corps (3rd and 8th Infantry Divs.), the 13th Landwehr Infantry Div. and the German 47th Reserve Div. (Lt.-Gen. von Besser) from the Mszana–Tymbark area in the direction of Bochnia. The Austro-Hungarian formations were brought up by train from the IV. Army supply area through Cracow and Sucha to Chabowka. The 47th Reserve Div. came up by train to Cracow from the western theatre of war. Further, the orders issued by the Austro-Hungarian Supreme Command contained instructions to General von Woyrsch to prevent any withdrawal of troops from the Russian IV. Army front opposed to him, and to associate himself with the attack just begun by Mackensen on Lodz and Lowicz, as soon as the German division should have arrived on the field from the western front.

The Austro-Hungarian I. Army was to maintain a strictly defensive attitude. Under its command were placed the left wing of the IV. Army, Arz's group with the 17th and 27th Infantry Divs., and also the Honved infantry div.

The IV. Army was to give way before the Russian pressure and be drawn back gradually to the ring of forts round Cracow. Ljubičić's group, to which Kritek's Corps (the XVII.) was to be added, went to its command area with Nagy's cavalry group.

On Nov. 25 the whole IV. Army front and Ljubičić's group were sharply engaged, and on the 26th Ljubičić, to avoid exposing his group to the approaching great Russian attack, retired to the line Niepolomice–Szarow–Gdow–Dobczyce, the 11th Infantry Div. being hard pressed by the Russians in the retreat.

The IX. Army also began its retreat on Nov. 26, but without being molested by the Russians. Even the XVII. Corps, on the right wing, reached the W. bank of the Kosielniki brook, N. of Niepolomice, without interference, and was able to begin placing its reserves on the S. bank of the Vistula during the night.

On the 27th the Russian pursuit began to make itself felt. Vigorous attacks were made on Ljubičić's centre and N. wing, and he retired before them by order of the IV. Army Command to the prepared position near Cracow:—Rybitwy–Prokocim–Soboniowice–Siepraw–Kamienik–Lubien. By the evening of the 27th the entire XVII. Corps had arrived on Ljubičić's right wing.

North of the Vistula the IV. Army had by the evening of the 28th come in behind the ring of forts.

To the S. of Ljubičić's group, in the meantime, Nagy was to have repulsed a Russian cavalry corps concentrated at Neu Sandec. As, however, the 10th Cavalry Div. was involved in difficult fighting on Ljubičić's right wing, Nagy could not get his whole force together and had to limit himself to obstructing a possible Russian line of advance at Tymbark with the 6th and 11th Cavalry Divs., a group of the Polish volunteer legion and 2 Landsturm battalions. But, on being attacked there by infantry detachments and the Russian cavalry corps in superior numbers on Nov. 27, he withdrew to a strong position, which he was able to hold, on the Dobra heights. During the retreat of the IV. Army the 106th Infantry Div., and 1st and 11th Landsturm Bdes., as well as the 45th Landwehr Infantry Div., were drawn in to reënforce the fortress garrison, while the German 47th Reserve Div. was detraining at Cracow. On the left wing of the IV. Army the VI. Corps, between Kosciol and Zieloniki, formed a link with the I. Army. One brigade of this corps came to Olkusz behind the right wing of the I. Army. On Nov. 28, the XIV. Corps sent off the 13th Landwehr Infantry Division.

The Russian III. and IX. Armies made their way slowly and cautiously up to the ring of forts, coming to a halt N. of the Vistula in an arc from Niepolomice by Point 320 (W. of Wierzno), and Michalowice to Skala. South of the Vistula the Russian XI. and IX. Corps were pursuing Ljubičić's group.

Meanwhile, on the Austro-Hungarian I. Army's front, the N. wing of the Russian IX. Army and the IV. Army had been fairly quiet, whereas Woyrsch's and Böhm's armies went through some fierce fighting in connexion with Mackensen's army.

On Nov. 26 the N. wing of the Austro-Hungarian II. Army (Hauer's cavalry corps) had attacked in the direction of Szczerczow, in order to relieve Mackensen's right wing, which was fighting at Wola Wiezowa. At the same time the IV. and XII. Corps of this army were fighting hard, on both sides of the road leading from Dzialoszyn to Nowo-Radomsk on the line Koscielec–Struza, against the Russian Grenadier Corps and XVI. Corps.

Hauer's attack and the advance of the German general reserve brigade, to the N. of it, were successful. Hauer's cavalry drove the Russians out of the Sosnia hollow, and the general reserve brigade took possession of Nowa Wies and Leczyska. But on the arrival of Russian reënforcements the attack came to a standstill before Szczerczow.

The Russians, who were concerned above all to prevent Mackensen's S. wing and the Austro-Hungarian II. Army from advancing on Piotrkow and Nowo-Radomsk respectively, had actually detrained 2 new divisions (7th and 10th Infantry Divs.) and set them on the march towards Belchatow—as became known from a captured report. In view of these reënforcements, which threatened the N. wing of the II. Army, Woyrsch and Böhm had to divert some of their forces towards the north. The 16th Infantry Div. of the XII. Corps—which was replaced by the 35th Reserve Div.—was withdrawn from the front and sent to Brzeznica on the Nowo-Radomsk road under the protection of the Austro-Hungarian 35th Infantry Div. The main forces of the IV. Corps remained in its position N. of this road, but it bas-

talions of the 31st Infantry Div. were taken back to Pajeczno as reserve. This section was added to the 16th Infantry Division.

Farther N., meanwhile, the Russian 7th Infantry Div.'s action had made itself felt from Belchatow. On Nov. 30 the general reserve brigade had to retire to the Sosnia, while Hauer, being also involved, fell back behind the Krasowa and on Rusiec. On the adjacent right wing of Mackensen's army, the 48th Res. Div., which had rolled up from the western front, had meanwhile engaged the Russian V. Corps. On Nov. 30 the Russians—presumably only in order to prevent a withdrawal of forces—arranged for another vigorous attack by their IX. and IV. Armies against Woyrsch's S. wing and the Austro-Hungarian I. Army, but this met with no success whatever.

The actions fought during the retreat in the last days of Nov., S. of Cracow in W. Galicia, together with the events which took place N. of the fortress in the zone of Dankl's and Woyrsch's armies, may be said to have brought the battle of Cracow to a close. No strategic success for the Central Powers had resulted from it. New operations were therefore begun on both wings of the front, which resulted in the second part of the battle of Lodz in the N. (Dec. 1–15), the action at Belchatow by the II. Army, and the victorious battle of Limanowa-Lapanow, S. of Cracow (Dec. 3–14), following on the regrouping ordered by the Austro-Hungarian Army Higher Command on Nov. 26.

*Second Battle of Lodz* (*Dec. 1–15*).—The numerous attacks delivered by the Russian I., II. and V. Armies in the end of Nov. against Mackensen were one and all fruitless. But when the expected German reënforcements rolled up from the W. (II. and XIII. Army Corps and III. and XXIV. Res. Corps) and from E. Prussia (German 1st Infantry Div.), there was a revival of the offensive idea on the part of the Germans.

The III. Res. and XIII. Corps were sent to the extreme N. wing to Lt.-Gen. von Morgen's group (I. Res. Corps) which was being hard pressed by the Russian I. Army. The II. Corps was to reënforce Mackensen's S. wing.

When the German 1st Infantry Div. had arrived on Gen. von Morgen's front, his group made a successful counter-attack, the Russian I. Army's right wing being surprised and thrown back on to the line Ilow–Kiernoznia–Bielawy.

Simultaneously the German II. Corps entered the area N. of Lask to reënforce Frommel's cavalry corps and the Posen fortress garrison in their struggle with the Russian XIX. Corps. The 48th Res. Div. of the XXIV. Res. Corps had already been sent into action with the main body of the Breslau fortress garrison, N.E. of Widawa, against the Russian 7th Infantry Division.

Dec. 1 was the date fixed by Mackensen for the concentric attack on Lodz by the IX. Army. His N. wing alone—Gen. von Morgen's group—was to push forward N. of the Bzura in an easterly direction. Böhm's army was to support this attack by a blow on Piotrkow. The strong pressure by the II. Corps with which the attack began was rewarded at the end of the day by the capture of Dobran and Pabianice.

After the arrival of all the German reënforcements—of which the 25th Res. Div. had come up to Wloclawek on Nov. 30, while the III. Res. Corps was on its way thither by train—the German IX. Army had 21 infantry and 5 cavalry divs. as against the Russians' 26 infantry and 2 cavalry divisions.

While Gen. von Morgen's attack could make only very slow progress against the strong and technically well-constructed enemy positions, the concentric advance on Lodz proceeded rapidly. The German XI. and XVII. Corps came through some particularly segere fighting with conspicuous success. On the S. wing a successful push was also carried out by the German II. Corps and the 48th Reserve Div., in conjunction with the left wing of Woyrsch's army, against the Russian XIX. and V. Corps and a group of cavalry.

Little of importance had happened meanwhile to the Austro-Hungarian I. Army. Its task, which was also that of the centre and S. wing of Woyrsch's army, consisted mainly in preventing the shifting of Russian troops from the IV. and IX. Armies towards Lodz. The two armies could both solve this task either by attacking vigorously along the whole front, or by transferring reserves to the N. wing of the II. Army, thus enabling it to inflict more damage by its attack on Piotrkow.

The Austro-Hungarian Higher Command decided in favour of the second alternative. It extended the left wing of Dankl's army to beyond Zarki, and transferred the German 15th Reserve Bde. promptly from there to Böhm's N. wing. The 27th Infantry Div. was at the same time withdrawn from the VI. Corps on the N. wing of the IV. Army and sent to Sieradz on Dec. 4.

But the Russians had already in the last days of Nov. taken from the front the III. Caucasian Corps, which had greatly distinguished itself in the battle of Ivangorod and had been fighting during Nov. on the left wing of the Russian IV. Army against Dankl's N. wing, and brought it up through Nowo-Radomsk to the S. wing of their V. Army, in readiness for an advance against the II. Corps, which had been put in on Mackensen's S. wing, and the 58th Res. Division.

Böhm's attack on Piotrkow, however, which set in on Dec. 1, caught the III. Caucasian Corps while it was being shifted and forced it into an engagement at Belchatow. Thus it could not play its ordained part in the decisive battle of Lodz.

In this engagement the Russians had on the field the III. Caucasian Corps, parts of the XVI. Corps, the Guard Cavalry Corps, the 13th Cavalry Div. and 2 Cossack divs. Böhm's forces consisted at first only of the IV. Corps, the German Guard Res. Bde. and Hauer's cavalry corps.

After initial Austro-Hungarian successes the numerical superiority of the Russians began to tell. Böhm had therefore to await the arrival of the 27th Infantry Div.—which was to be placed on the N. wing on the road leading from Widawa to Piotrkow—and the 15th Reserve Bde., and then to renew the attack, strengthened by these new forces.

In the meantime the decision at Lodz had been reached on Dec. 6. Yielding to the constant pressure of the German II. and XI. Corps, the Russians evacuated Lodz during the night of the 5th–6th, and retired to the line Brzeziny–Podwiaczyn–Bedkow.

This retreat, however, brought no relief to Böhm's army. On the contrary, the Russians concentrated new forces at Piotrkow and employed them in violent counter-attacks against Böhm, forcing him, on Dec. 7, to close down the attack on Piotrkow and place himself on the defensive. In case of an attack being delivered from Piotrkow against Mackensen's right army wing, however, Böhm planned a flank assault from his position.

In Mackensen's army—now that Lodz had been taken and the Russians pursued up to the new line of resistance at Brzeziny–Bedkow—the interest of the German Supreme Command was focussed on the N. wing of the German IX. Army, General von Morgen's group. Before the capture of Lodz the German VII. Corps had already been withdrawn from the front at Zgierz, and sent to Piatek to coöperate in the attack on the very strong front at Lowicz–Ilów. By Dec. 6 the 25th Reserve Div. was also able to join in the attack from Gabin and the III. Res. Corps had finished detraining at Wloclawek.

On Dec. 7 the XIII. Corps, being now assembled, was ordered to make an encircling attack on the N. wing of the Russian I. Army and succeeded in forcing it back a little way on the 8th. On the same day the III. Res. Corps also came into the battle, attacking N. of the XIII. Corps; the XVII. Corps advanced along the Piatek–Lowicz road and reached the Sobota–Bielawy area. On Dec. 9 the grouping was completed and the general attack by von Morgen's group, starting from the N. wing, could now be launched in full force. There were 4½ German corps as against 6 Russian in the attack (III. Res. Corps, XIII. Corps, 1st Infantry Div., XVII. and I. Res. Corps against V. Siberian, II. Caucasian—brought from East Prussia—VI. Siberian, I. Turkestan, and VI. Corps and one infantry div. each of the IV. and VIII. Siberian Corps).

An extremely violent bombardment set in on Dec. 11 along the whole front. On the right wing the XVII. Corps, supported by parts of the I. Res. Corps, penetrated the Russian infantry position N. of Lowicz. On the 12th the heights at Ilów and N. of it were taken by the III. Res. Corps and the hamlet of Wiejce was stormed by the XIII. Corps.

By the 15th the Russians had been beaten back to the Bzura, in spite of their gallant counter-attacks. On the same day and during the night they were forced by further very heavy German attacks to retire to the E. bank of the Bzura, leaving Lowicz in the hands of the XVII. and I. Res. Corps.

*Battle of Limanowa-Lapanow (Dec. 5-12).*—According to the plan drawn up for the battle of Limanowa-Lapanow Field-Marshal-Lt. Roth, commander of the XIV. Corps, was to attack the Russian III. Army in flank and rear on Dec. 2 with the 3rd and 8th Infantry Divs., the 13th Landwehr Div. and the 47th Reserve Div. from the area of Mszanadolna-Chabowka, E. of Lapanow. In the meantime, Ljubičić was to maintain his position, and, in proportion as the XIV. Army attack progressed, to go over to the attack likewise, starting from his right wing. The 6th and 10th Cavalry Divs. and the 11th Honved Cavalry Div., which had also been placed under Roth's group, were to cover the proceedings in the direction of Neu Sandec.

At the beginning of Dec., before the envelopment by Roth's group could take effect, Ljubičić's 4th Infantry Div. and 3rd Cavalry Div.—reduced to less than half their strength—were opposed by 4 infantry divs. and 3 to 4 cavalry divisions.

The forces which Roth had assembled for the flank attack were by no means up to their full establishment. The 3rd and 8th Infantry Divs. and 13th Landwehr Infantry Div. could be counted in all at 9,000 rifles, and the three cavalry divs. at 1,500. Only the German res. div., with a strength of 14,000 rifles, was up to its full establishment.

On Dec. 3 the 3rd Infantry and 13th Landwehr Infantry Div. began their advance from Dobra to the N. and, after some difficult combats with the Russian cavalry, reached the line of Wisniowo and the heights N. of Wilkowsko. At Wisniowo Ljubičić's right-wing division (the 30th) joined up with the 13th Landwehr Infantry Div. and began to advance likewise in the course of the day (Dec. 3).

Meanwhile, the 8th Infantry Div. had gone forward, with the XI. Honved Cavalry Div., along the road to Tymbark and driven back the Russians in the direction of Neu Sandec. The VI. Cavalry Div. had advanced to the Widoma height, to give direct protection to Roth's right flank, and had driven the Russian infantry in front of them.

By Dec. 5 the flank attack was in full swing. The German 47th Res. Div. had pushed forward beyond Rzegocina and Trczina, the 8th Infantry Div. up to Zbydniow and Tarnawa. Ljubičić's left wing had to deal with heavy Russian counter-attacks. The 13th Landwehr Infantry Div. came up to the Russian positions at Gora Sv Jana.

The Russians now realized the threatening nature of the attack by Roth's group. The Russian VIII. Corps (15th and 16th Infantry Divs.) was sent off from the Dukla area, on the W. wing of Brussilov's army, in the direction of Roth's right flank. At the same time the front of the IX. and XI. Corps at Wieliczka and Dobczyce was drawn back to Bochnia, and parts of the XXI. and X. Corps were transferred to the S. wing of the III. Army.

On the N. wing of the Austro-Hungarian IV. Army, Kritek's group, the XVII. Corps (15th and 16th Infantry Divs.) pressed forward S.W. of Niepolomice up to the line Grabie-Ksiaznice without encountering any important resistance. Roth's group and the XI. Corps had fought their way through Lapanow and S. of it as far as Ksiaznice-Sobolow-Raybrot.

To all appearances Radko Dimitriev was expected to offer a determined resistance on this line until the shifting of the XXI. and X. Corps had been completed. The flank attack delivered at this moment by the Russian VIII. Corps, which had come up from Neu Sandec and was fighting vigorously on the line Limanowa-Raybrot, made itself very unpleasantly felt. It was opposed at Limanowa by Nagy's 3 cavalry divs. (6th and 10th Cavalry Divs., 11th Honved Cavalry Div.) which heroically repulsed all the onslaughts.

On the whole front of the Austro-Hungarian IV. Army violent fighting had broken out everywhere. The Higher Command had been informed in good time of the shifting of the Russian VIII. Corps, and taken measures to counter it. An order was issued on Dec. 5 to transfer the 55th Landwehr Infantry Div. from Cracow and the 39th Honved Infantry Div. from the right wing of the I. Army by train to the S. wing of the IV. Army. Von Arz, commanding the VI. Corps, was to take over the command of both divs. At the same time Boroević's army was to carry out a relief offensive towards the N., by which the Russians were to be prevented from transferring yet more of their forces from the Carpathian front to Radko Dimitriev's army.

Boroević therefore proceeded to reinforce his left wing. At Muszyna Leluchow he concentrated a group, under Gen. Szurmay, consisting of half of the 38th Honved Infantry Div. and one combined Honved infantry div.—in all 20 battalions, 3 batteries and one squadron. These he had brought up by train from the Uzsok pass.

On Dec. 7 Szurmay was to take the offensive at Neu Sandec conjointly with the 4th Cavalry Div. and Col. von Weiss's brigade, which were holding the crossings S. of Neu Sandec and W. of Alt Sandec respectively.

On Dec. 8 the whole front of Boroević's army was to begin the advance on Bartfa on both sides of the Ondava and Laborcza valley. The remaining half of the 38th Honved Infantry Div. stayed behind in the Uzsok pass under Col. Czermak.

Meanwhile, on the right wing of the IV. Army, Field-Marshal-Lt. von Arz, who had been placed under the Roth group, had taken over the command of the 3 cavalry divs., the 13th and 45th Landwehr Infantry Divs., the 39th Honved Infantry Div. and the Polish Legion, and received in addition a combined brigade sent up from the I. Army. The 15th Infantry Div. was brought into the Wieliczka area.

The IV. Army attack went forward with great vigour in an easterly direction on Dec. 8. On the N. wing the 110th Landsturm Bde. and 106th Landsturm Infantry Div. made a sortie on Kocmyrzów from the ring of forts. Kritek stormed Zakrzów (S.W. of Niepolomice), and the XIV. Corps gained ground by attacking in the direction of Bochnia. On the S. wing Arz, with the 13th and 45th Landwehr Infantry Divs., made a furious attack on the right wing of the Russian VIII. Corps by way of Rzegocina and the S. of Raybrot and stormed the Kobyla height S.E. of Raybrot, while the 3 cavalry divs. and those parts of the 39th Honved Infantry Div. already engaged had to contain the left wing of the VIII. Corps at Limanowa. The following day brought yet more successes, but on Dec. 10 the Russians were able to put parts of the XXI. and X. Corps into the field against the Austro-Hungarian XIV. Corps, which gradually found itself faced by superior numbers.

Strengthened by these new additions to their forces, the Russians, on Dec. 10, started an embittered counter-offensive along the whole front, during which the XIV. Corps lost all the advantages it had won on the previous day, and had to retire. On the N. wing Kritek repulsed all attacks, but had to withdraw his right wing to Jaroszowka in conjunction with the XIV. Corps. On the S. wing also the fighting broke out afresh with great violence. Arz was forced to surrender the Kobyla height, and the Hussars of the 10th Cavalry Div. and 11th Honved Cavalry Div. won undying laurels at Limanowa, where they repulsed all the Russian attacks in a fine fight. The vigorous Russian counter-offensive had brought the Austro-German offensive to a standstill. The Army Higher Command was obliged to bring up new forces with which to repeat the attack.

Meanwhile, in the I. Army an XVIII. Corps had been formed from 2 Landwehr divs. Both this corps and the 6th Infantry Div., advancing on Boroević's left wing, were to be brought up. At 11 A.M. the battle, raging with the same intensity along the whole front, and particularly on the S. wing, had reached its climax, and by the afternoon the crisis seemed to have been overcome. Although Arz had to retreat on Mlynne and to the W. of Limanowa, Roth's centre and left wing held their ground.

With the arrival on the field of the combined brigade of the X. Corps N. of Limanowa during the afternoon, and the encircling attack by half of the Honved infantry div., coming from Zalesie, which completely surprised the Russian left wing, the Russian power of attack was crippled here also, and the battle on the S.

wing decided in favour of Arz. Similar merciless attacks against the centre and N. wing recoiled without any result. The arrival of the combined brigade and the advance of Szurmay's group, reinforced by the 6th Div., on Neu Sandec in rear of the VIII. Corps had sufficed to turn the scale.

On Dec. 12 the Russian VIII. Corps fell back before Arz who occupied Chomranice and Marcinkowice. Szurmay drove the Russians out of Neu Sandec and found touch with the Arz group.

On Dec. 13 the Hungarian 39th Honved Infantry Div. pressed forward through Jakobkowice to Michalczow, where the Russian 15th Infantry Div. was lying, in order to ease the attack in front of the main body of Roth's group. The 45th Landwehr Infantry Div. had meanwhile taken the Russian positions in the Lososina valley, and the 13th Landwehr Infantry Div. had again seized the hotly disputed Kobla height. These victories by Arz's and Roth's groups, together with the rapid advance of the III. Army —which by Dec. 14 had reached the area S. of Jaslo, Krosno and Lisko,—decided the battle of Limanowa–Lapanow.

The effect of the Austro-German victory at Lowicz, coinciding with this, and of the earlier one at Lodz, was to cause the Russians to retreat on Dec. 15 on their whole front.

By evening on Dec. 15 the IV. Army had reached the area of the mouth of the Szreniawa and Zacliczyn, while the III. Army remained in the area it had already occupied and joined up with the Szurmay group S. of Zacliczyn.

General Tanassy's sortie from the Przemysl fortress on Bircza, with 19 battalions and 12 batteries, which took place at the same time, was intended to threaten the retreating Russians in rear, establish communications with Krautwald's group which had pushed forward to the area S. of Lisko, and at least prevent any more troops being taken from the siege army to strengthen the Russian Carpathian front.

The heroic defenders of Przemysl were actually able by the 17th to reach the heights at Cholowicze, S. of Cisowa, at Struzyna, and the Szybewice height, and even to seize a Russian *point d'appui*. But when it became certain on Dec. 19 that coöperation was impossible, owing to the distance between themselves and Krautwald's group, and as at the same time a new Russian attack was threatening the foreground position of the fortress, Kusmanek drew the sortie groups back inside the ring of forts.

North of the Vistula the I. Army had advanced as far as the Szreniawa, Woyrsch's army and the II. Army up to the Pilica and Piotrkow. The German IX. Army was heavily engaged in the Bzura–Rawka sector.

On Dec. 15 the Austro-Hungarian 27th Infantry Div. took Piotrkow, and parts of Woyrsch's and Böhm's armies crossed the upper reach of the Pilica. On Dec. 17 Woyrsch pressed forward to the Nida, Dankl to the Nidzica. The IV. Army came up to the Dunajec, Szurmay took Tuchów, and Boroević's army reached the line Jodlowa–Frysztak–Odrzykon–Korczyna and the area N.W. of Lisko.

*The Russian Counter-Offensive in Western Galicia.*—While practically no opposition was encountered in the pursuit of the Russian IX. and IV. Armies in the bend of the Vistula and of the Russian III. Army N. of the river, Boroević's army had to do some hard fighting against the Russian VIII. Army, particularly on its left flank at Lisko. Protected in the W. by the Dunajec and their strong positions on the Nida, the Russians on Dec. 18 began a counter-offensive in western Galicia directed against the IV. and III. Armies. During their retreat they had again brought up reënforcements to eastern Galicia and also parts of the siege army from Przemysl (60th Reserve Div.) which they used against the III. Army.

Krautwald's group, which had pushed on in the direction of Lisko, was the first to break off the offensive. The W. wing and centre of the III. Army succeeded by hard fighting in holding the line Tuchow–Jodlowa–Brzostek until Dec. 20. On Dec. 21 an extremely violent attack was launched along the whole front in western Galicia, culminating in the battle of Jaslo (Dec. 21–25), which caused the retreat of Boroević's army (the III.). Although the Austro-Hungarian VI. Corps came into action on the W. wing, and the X. and XVIII. Corps on the E. wing, the Russian offensive could not be checked. By Dec. 25 the W. wing of the III. Army (IX. Corps) had retired on Gorlice, the centre (III. and VII. Corps) on Zmigrod and Dukla, and the E. wing (X. and XVIII. Corps) on to the Carpathian ridge to the E. of Lisko. At the end of Dec. the IX. Corps was incorporated with the Austro-Hungarian IV. Army, where Arz took over the command of the VI. and IX. Corps and the Szurmay group and intercepted all attacks against the right wing of the IV. Army on the Luzna–Gorlice–Malastow front.

The III. Army continued its retreat as far as the line Konieczna–Alsópagony–Alsókimes–Rosadomb–Radoszyce and the heights N. of Cisna.

In the gap between the two armies in the Malastow–Konieczna area, the 4th and 6th Cavalry Divs. and the Honved Cavalry Div. prevented the break-through by which the Russians were attempting to outflank the S. wing of the IV. Army.

The Russian counter-offensive brought the campaigns of 1914 to a close. During the latter half of Dec. active fighting in the bend of the Vistula died down. Mackensen's victory-hardened troops, indeed, took Skierniewice, Lubocz and Inowlodz, but at the end of Dec. his front settled down to a war of positions, which lasted throughout the winter, over the whole bend of the Vistula, until the spring offensive in Galicia.

On the Carpathian front there was no respite, for the actions fought by the III. Army during the retreat developed into new battles of gigantic proportions, by which the Austro-Hungarians hoped to achieve the relief of Przemysl, while the Russians were exerting themselves to break through into Austria-Hungary across the Carpathians and crush the Austro-Hungarian army, as a fighting factor, out of existence.

Although the battles of 1914 had given the Russians possession of the whole of eastern and central Galicia, the Central Powers for their part could point to their great success in bringing the Russian "steam-roller" to a standstill before the gates of Germany and, in addition, to having repeatedly seriously beaten the Russian colossus in battle and taken the initiative from him by repeated offensives which were distinguished by the rapid and effective shifting of forces. (E. J.)

**LÖFFLER, FRIEDRICH** (1852–1915), German biologist, was born at Frankfort-on-the-Oder June 24 1852 and educated at the universities of Würzburg and Berlin. He early began the study of parasitic diseases, and his description of the bacillus of diphtheria, published in 1884, was the originating cause of the modern anti-toxin treatment. He died in Berlin April 8 1915.

**LOGUE, MICHAEL** (1840– ), Irish ecclesiastic, was born at Kilmacrenan, co. Donegal, on Oct. 1 1840, of peasant stock. He was ordained priest in 1866 at Paris, where he had been professor of belles lettres and theology at the Irish College. In 1879 he was consecrated Bishop of Raphoe, was made Archbishop of Armagh in 1887, and was raised to the cardinalate in 1893. Though completely in sympathy with the nationalist aspirations of his Roman Catholic fellow-countrymen, Cardinal Logue maintained a correct and loyal attitude during the World War, and on June 19 1917, when numbers of the younger clergy were beginning to take part in the Sinn Fein agitation, he issued an "instruction" calling attention to the teaching of the Church as to the obedience due to legitimate authority, warning the clergy against belonging to "dangerous associations," and reminding priests that it was strictly forbidden by the statutes of the National Synod to speak of political or kindred affairs in the church. In 1918, however, he placed himself at the head of the opposition to the extension of the Military Service Act to Ireland, priests being allowed to denounce "conscription" from the altar on the ground that the question was not political but moral. He reprobated the campaign of murder against the police and military begun in 1919, and in his Lenten pastoral of 1921 he vigorously denounced murder by whomsoever committed, though the force of this denunciation was weakened by an almost equally vigorous attack on the methods and policy of the Government. The cardinal was much respected by people of all classes and creeds. In earlier life he was a keen student of nature and an excellent yachtsman.

**LONDON, JACK** (1876–1916), American novelist, was born at San Francisco Jan. 12 1876 and educated at the university of California. He was a born adventurer, going to sea at the age of 17 and serving before the mast as A.B. He went with the first rush to Klondike in 1897 and tramped across the States and Canada, being in gaol more than once as a vagabond. In 1904 he went to Japan as war correspondent and in 1914 to Mexico in the same capacity. In 1906 he started on a voyage round the world in a 50-ft. ketch-rigged yacht and disappeared for two years. His novels, for the most part published first in London, reflect his wild adventurous life, the best known being *The Son of the Wolf* (1900); *The Call of the Wild* (1903); *Moon Face* (1906); *Martin Eden* (1909); *South Sea Tales* (1912), and his last, *The Little Lady of the Big House* (1916). He died at Glen Ellen, Cal., Nov. 22 1916.

See *The Book of Jack London* (1921), by his wife Charmian London.

**LONDON** (*see* 16.938), the capital of the British Empire, was still in 1921 the largest city in the world, surpassing its nearest competitor (Greater New York) by at least one and a half million souls. The Metropolitan Police District has a radius of 15 m. from Charing Cross (area about 692 sq. m.), but it does not include the City of London (area 658 ac.), which has its own police force. The area of the administrative county of London, which coincides with that within the registrar-general's tables of mortality, is about 117 sq. m.; by the Representation of the People Act of 1918 it included the whole of the Metropolitan Parliamentary Divisions, as well as the 28 Metropolitan Boroughs and the City. The London main drainage area is 148·6 sq. m. in extent. Water London has an area of 561·4 sq. m.

The multiplication and electrification of suburban railways and the extraordinary development of the motor-omnibus and the private motor-car have greatly increased the extent of what may be called the practicable area of suburban London. An interesting development is the Hampstead Garden Suburb, at Golders Green, on the N. side of London, in which every house stands in its own garden and the number of houses is limited to eight to the acre. The pre-war rents varied from 3s. 3d. a week to £350 a year. About 2,000 houses have been erected.

The Unemployment (Relief Works) Act of 1920, largely designed for the benefit of ex-service men, enabled entry to be made upon land for new roads at seven days' notice. Under this Act no fewer than nine great arterial roads had been taken in hand in 1921 by highway authorities with the assistance of the Ministry of Transport (which absorbed the old Road Board). These were the Eltham Bye Pass, the Shooters Hill Bye Pass, the South Circular Rd. (through Woolwich, etc.), the North Circular Rd. (through Willesden, Hendon, etc.), the Western Avenue (through Hammersmith), the Eastern Avenue (across the Lea Marshes), the new Cambridge Rd. (starting at Tottenham), the Barking Bye Pass, and the new Chertsey Rd. The Croydon Bye Pass and the Brentford Bye Pass were begun somewhat earlier. There were in 1921 over 2,200 m. of streets in the county of London, maintained and kept in good order at a total cost of at least £3,000,000 per annum. Street improvements of more than local importance are generally carried out by the London County Council.

The only new bridge over the Thames is Southwark bridge, which was opened for traffic on June 6 1921. It has five arches and is 13 ft. wider than the old one.

The Woolwich tunnel, connecting N. and S. Woolwich and consisting of an iron tube 327 yd. long and 11 ft. in diameter, was opened in 1912 at a cost of £85,862. It is intended as a supplement to the free ferry (still used by vehicles), which is subject to interference from fogs. In 1920 the daily average of passengers using this tunnel was about 28,000, not far short of double the number using the Greenwich tunnel. Blackwall tunnel is traversed daily by about 2,000 vehicles. Rotherhithe tunnel was closed from 1915 to 1918, but its daily average in 1919 was about 1,500 vehicles.

*Architecture.*—During 1920–21 comparatively few additions of importance were made to the architectural glories of London; but it is, perhaps, more strange that the interminable series of aerial bombardments to which it was subjected during the World War left practically no trace on any buildings of public interest. There was really almost nothing to show that London was besieged from the air for four years. The fine old Flemish windows in the chapel of Lincoln's Inn were indeed shattered by a Zeppelin bomb on Oct. 13 1915; but this loss is, perhaps, counterbalanced by the discovery of an unknown Elizabethan façade near St. Bartholomew's church, brought to light by the concussion of another bomb in the same year.

Such new buildings as call for mention here were mainly erected in connexion with schemes of improvement initiated before the World War. The extensive clearances made in and to the N. of the Strand in 1899–1905, chiefly to provide a new approach to Holborn, opened up the view of St. Mary-le-Strand and St. Clement Danes, and created the handsome crescent of Aldwych and the broad new thoroughfare of Kingsway. Among the edifices already erected in the former are Australia House (1911–18), the imposing London headquarters of the Commonwealth of Australia; the Marconi House, and the Gaiety theatre (elevation by Norman Shaw). The Bush House, close by, designed by Harvey Corbett, architect of the Bush building in New York, illustrates (with some restrictions as to height) the merits of American commercial architecture. The substantial buildings of Kingsway belong mainly to the domain of architectural engineering. Prominent among them are the Kodak building and the large office of the Public Trustee (1916). The Wesleyan Central Hall in Westminster is a huge domed building by Lanchester and Rickard (1911), with a fine staircase. Not far off is the Middlesex Guildhall, a Gothic building by J. S. Gibson (1913). The new Ministries of Education, Health, Trade and Works were designed by J. M. Brydon in an Italian Renaissance style and completed in 1919. Across the river, at the other end of Westminster bridge, stands the new London County Hall, designed by Ralph Knott in a Renaissance style. It is one of the largest buildings of modern times, having nine storeys and a river façade of 750 feet. In the City is the new General Post Office (1910), a reënforced concrete building by Sir Henry Tanner. The Royal Automobile Club in Pall Mall was built in 1911 by Mewes & Davis, in a somewhat florid French Renaissance style. Among commercial buildings of importance are the large extension of Selfridge's store by Sir J. Burnet (1921); the extension of Whitcley's in Queen's Rd., Bayswater; the new offices of the Port of London Authority (by T. E. Cooper) and the Metropolitan Water Board (by H. Austen Hall, 1920).

*Monuments and Memorials.*—On Nov. 11 1920, the second anniversary of the Armistice after the World War, in the middle of the roadway of Whitehall, was unveiled the Cenotaph, commemorating in dignified simplicity the "Glorious Dead of 1914–18." It was designed by Sir Edwin Lutyens. Other war memorials include one to Edith Cavell (by Frampton) near Trafalgar Sq., one to London's soldiers (by Sir Aston Webb) in front of the Royal Exchange, and the Monument of Belgium's Gratitude (by J. Rousseau and Sir R. Blomfield) on the Victoria Embankment. In front of Buckingham Palace is the elaborate National Memorial to Queen Victoria, designed by Sir Aston Webb, the sculptures by Sir Thomas Brock. To provide a suitable background for this monument the façade of the E. wing of Buckingham Palace was rebuilt by Sir Aston Webb, while the Mall was widened to provide a "triumphal avenue" to the massive Admiralty arch. Near Westminster Abbey has been erected a replica of St. Gaudens' famous Chicago statue of Abraham Lincoln; and a replica of Houdon's statue of George Washington has been set up near the National Gallery. On the top of the Green Park arch is a fine group of Peace in her quadriga, by Adrian Jones (1912). On the Horse Guards Parade are statues of Lord Wolseley (by Goscombe John) and Lord Roberts (by H. Bates); and similar monuments to Lord Kitchener and Lord Fisher are to follow. Statues of Florence Nightingale (1913) and Captain Scott, the Arctic navigator (1915), have been erected in Waterloo Place; and here, too, is the monument to Edward VII., by Bertram MacKennal (1921).

*Communication.*—The terminal railway stations were, of course, a favourite target of the German airmen during the war; considerable damage was done to Liverpool St. station on June 13 1917, and St. Pancras also was injured slightly on Feb. 17 1918. The new Waterloo station, begun before the war, was nearly completed in 1921. The Central London railway had been extended to Liverpool St. and Ealing (in conjunction with the G.W.R.) The Bakerloo tube ran to Queen's Park, where a junction was effected with the L. & N.W.R. for through running to Watford. The Metropolitan District trains reach Hounslow, Uxbridge, East Ham and Barking. No new "tubes" had been opened, but various schemes of extension were in the air. The Underground group of companies (popularly known as the "Traffic Combine"), formed by the amalgamation of the Metropolitan District, the London Electric, the City and South London and Central London railways, and the London General Omnibus Co., had greatly improved facilities for through traffic between the associated companies. Its headquarters are at Electric Railway House, Broadway, Westminster. Fares had been standardized and, though necessarily higher than in pre-war days, were (judged by the average fare paid per passenger) cheaper than in New York, Paris or Berlin.

The total mileage of tramways in Greater London in 1921 was 350. Horse traction for trams had disappeared. The annual number of passengers approached 700 millions. There were no tramways in the City or West End.

The great majority of motor omnibuses belong to the London General Omnibus Co., and are included in the above-mentioned "Combine" and in one system of numbered routes. Improved new vehicles have been introduced, carrying from 46 to 54 passengers (as compared with 34 on the old type). They carried 860 million passengers in all in 1919. During the busiest traffic period at least 300 to 400 omnibuses pass certain points hourly. In summer motor-omnibuses run to points 30 m. from the centre of the metropolis. A notable feature has been the great increase in motor chars-à-bancs running to places of interest within a radius of 50 m. or more from London.

Hansoms are now rarely seen, and the horse-drawn four-wheeler carries on a precarious existence only in the service of railway passengers with bulky luggage. The general service is maintained by motor vehicles ("taxicabs"), all provided with automatic taximeters. Of the 13,794 hackney carriages licensed to ply for hire in 1919, less than 2,000 were horse-drawn. Probably 75% of the entire traffic of the London streets is now carried on by motor.

London was in 1921 in regular communication with the continent of Europe by air. There were four daily services to Paris, one to Brussels, and one to Amsterdam, all starting from the Croydon aerodrome. About 400 passengers were dealt with weekly, and the number was steadily increasing. These services connect with air-services to various other points in Europe and even (*via* Spain) to Africa (Casablanca).

*Post Office.*—The buildings of the General Post Office were greatly extended, and an underground tube railway was constructed for the conveyance of postal packets of all kinds, extending W. to Paddington and E. to Whitechapel. The eight postal districts were subdivided into delivery office areas, each with its distinctive number, so that postal addresses are now completed with such formulae as W.C.1, N.W.3, S.E.25, and so on. In addition to the General Post Office and the head district offices there were 105 local delivery offices.

*Telephones.*—In accordance with the agreement of 1905 the State took over the whole business of the National Telephone Co. on Jan. 1 1912. Telephone call offices for public use are now found at nearly all post offices and railway stations, and at many shops, public libraries and the like. The London telephone area is 640 sq. m. in extent, containing 83 exchanges with an average of about 1,000,000 daily calls. Its headquarters are at 144A, Queen Victoria Street. From certain offices trunk calls may be made to any part of the country; and London is also in telephonic communication with various Continental towns.

*Population and Public Health.*—The pop. of Greater London in 1911 was 7,251,358 and in 1921 7,476,168; that of the county was 4,521,685 in 1911 and 4,483,249 in 1921; of the Outer Ring 2,729,673 in 1911 and 2,992,929 in 1921; of the City 19,657 in 1911 and 13,706 in 1921. Greater London increased by 10·2% between 1901 and 1911 and by 3·1% between 1911 and 1921, but the county of London had decreased by 0·3% and 0·9%.

The statistics for the metropolitan boroughs are as follows:—

| | Area in statute ac. | Population 1911 | Population 1921 | Increase (+) or Decrease (−) |
|---|---|---|---|---|
| Battersea | 2,163 | 167,743 | 167,693 | − 50 |
| Bermondsey | 1,503 | 125,903 | 119,455 | − 6,448 |
| Bethnal Green | 760 | 128,183 | 117,238 | −10,945 |
| Camberwell | 4,480 | 261,328 | 267,235 | + 5,907 |
| Chelsea | 660 | 66,385 | 63,700 | − 2,685 |
| Deptford | 1,564 | 109,496 | 112,500 | + 3,004 |
| Finsbury | 587 | 87,923 | 76,019 | −11,904 |
| Fulham | 1,706 | 153,284 | 157,944 | + 4,660 |
| Greenwich | 3,859 | 95,968 | 100,493 | + 4,525 |
| Hackney | 3,287 | 222,533 | 222,159 | − 374 |
| Hammersmith | 2,287 | 121,521 | 130,287 | + 8,766 |
| Hampstead | 2,265 | 85,495 | 86,080 | + 585 |
| Holborn | 405 | 49,357 | 42,796 | − 6,561 |
| Islington | 3,092 | 327,403 | 330,028 | + 2,625 |
| Kensington | 2,290 | 172,317 | 175,686 | + 3,369 |
| Lambeth | 4,083 | 298,058 | 302,960 | + 4,902 |
| Lewisham | 7,015 | 160,834 | 174,194 | +13,360 |
| Paddington | 1,357 | 142,551 | 144,273 | + 1,722 |
| Poplar | 2,331 | 162,442 | 162,618 | + 176 |
| St. Marylebone | 1,473 | 118,160 | 104,222 | −13,938 |
| St. Pancras | 2,694 | 218,387 | 210,986 | − 7,401 |
| Shoreditch | 658 | 111,390 | 104,308 | − 7,082 |
| Southwark | 1,131 | 191,907 | 184,388 | − 7,519 |
| Stepney | 1,767 | 279,804 | 249,738 | −30,066 |
| Stoke Newington | 863 | 50,659 | 52,167 | + 1,508 |
| Wandsworth | 9,107 | 311,360 | 328,656 | +17,296 |
| Westminster, City of | 2,503 | 160,261 | 141,317 | −18,944 |
| Woolwich | 8,282 | 121,376 | 140,403 | +19,027 |
| City of London (County Corporate) | 678 | 19,657 | 13,706 | − 5,951 |

The proposed new "London health area" would contain more than 9,000,000 souls.

The birth-rate sank from 24·3 per 1,000 in 1914 to 17·9 in 1917, but it had climbed again (according to the estimates of the registrar-general) to 26·5 in 1920. The death-rate curve for the same period was 13, 18, 12·4. Both birth and death rates are below the figures for 1910–4 (28·5 and 16·5 respectively). The comparative death-rates for the different boroughs were about the same, and London maintained its relatively favourable position in comparison with other large towns.

*Sanitation.*—The general regulations as to public health remain much as they were in 1910. The Act of 1891 was supplemented by the Housing Acts of 1909 and 1919, and various Diseases of Animals Acts. Many of the provisions of the National Insurance Acts of 1911–20 are administered by an Insurance Committee of 80 members, one-fifth of whom are appointed by the County Council. The mileage of the main sewers had increased to about 370 m., the cost of construction (to March 1919) to £12,608,000, and the annual cost of maintenance to about £500,000 (1918–9). The total annual cost, including debt charges and the work of the Metropolitan Borough Councils, was nearly £1,000,000 (1918–9).

*Hospitals.*—The powers of the Metropolitan Asylums Board were further defined by sundry orders of the Ministry of Health, and its scope and services increased. The activity of the London County Council, which controls the asylums for acute or recoverable cases of insanity, was especially notable in the improved treatment of tuberculosis and venereal diseases and in the campaign against infant mortality. The growing share of woman in the medical life of London is illustrated, *e.g.* by the existence of several hospitals wholly run by women. The so-called "Unit System," adopted from America, will (it is hoped) prove of great benefit.

*Water Supply.*—Under the Metropolitan Water Board Act of 1915 the Board was completing in 1921 a reservoir at Littleton, with a capacity of 6,350,000,000 gallons. The existing storage reservoirs for unfiltered water had an area of nearly 2,000 ac. with a capacity of 13,000,000 gallons. The total supply in 1919-20 was 100,079,000,000 gals. of water, being a daily average of 273,400,000 gallons (about 40 gallons per head of population). The total income on revenue account for 1919–20 was £3,158,391, and the expenditure £4,143,258, leaving a deficiency of £984,867, which was met by precepts levied on the contributory authorities. In 1916 the Metropolitan Water Board decided to save coal by chlorinating raw

**LONDON, JACK** (1876–1916), American novelist, was born at San Francisco Jan. 12 1876 and educated at the university of California. He was a born adventurer, going to sea at the age of 17 and serving before the mast as A.B. He went with the first rush to Klondike in 1897 and tramped across the States and Canada, being in gaol more than once as a vagabond. In 1904 he went to Japan as war correspondent and in 1914 to Mexico in the same capacity. In 1906 he started on a voyage round the world in a 50-ft. ketch-rigged yacht and disappeared for two years. **LONDON** (*see* 16.938), the capital of the British Empire, was still in 1921 the largest city in the world, surpassing its nearest competitor (Greater New York) by at least one and a half million souls. The Metropolitan Police District has a radius of 15 m. from Charing Cross (area about 692 sq. m.), but it does not include the City of London (area 658 ac.), which has its own police force. The area of the administrative county of London, which coincides with that within the registrar-general's tables of mortality, is about 117 sq. m.; by the Representation of the People Act of 1918 it included the whole of the Metropolitan Parliamentary Divisions, as well as the 28 Metropolitan Boroughs and the City. The London main drainage area is 148·6 sq. m. in extent. Water London has an area of 561·4 sq. m.

The multiplication and electrification of suburban railways and the extraordinary development of the motor-omnibus and the private motor-car have greatly increased the extent of what may be called the practicable area of suburban London. An interesting development is the Hampstead Garden Suburb, at Golders Green, on the N. side of London, in which every house stands in its own garden and the number of houses is limited to eight to the acre. The pre-war rents varied from 3s. 3d. a week to £350 a year. About 2,000 houses have been erected.

The Unemployment (Relief Works) Act of 1920, largely designed for the benefit of ex-service men, enabled entry to be made upon land for new roads at seven days' notice. Under this Act no fewer than nine great arterial roads had been taken in hand in 1921 by highway authorities with the assistance of the Ministry of Transport (which absorbed the old Road Board). These were the Eltham Bye Pass, the Shooters Hill Bye Pass, the South Circular Rd. (through Woolwich, etc.), the North Circular Rd. (through Willesden, Hendon, etc.), the Western Avenue (through Hammersmith), the Eastern Avenue (across the Lea Marshes), the new Cambridge Rd. (starting at Tottenham), the Barking Bye Pass, and the new Chertsey Rd. The Croydon Bye Pass and the Brentford Bye Pass were begun somewhat earlier. There were in 1921 over 2,200 m. of streets in the county of London, maintained and kept in good order at a total cost of at least £3,000,000 per annum. Street improvements of more than local importance are generally carried out by the London County Council.

The only new bridge over the Thames is Southwark bridge, which was opened for traffic on June 6 1921. It has five arches and is 13 ft. wider than the old one.

The Woolwich tunnel, connecting N. and S. Woolwich and consisting of an iron tube 327 yd. long and 11 ft. in diameter, was opened in 1912 at a cost of £85,862. It is intended as a supplement to the free ferry (still used by vehicles), which is subject to interference from fogs. In 1920 the daily average of passengers using this tunnel was about 28,000, not far short of double the number using the Greenwich tunnel. Blackwall tunnel is traversed daily by about 2,000 vehicles. Rotherhithe tunnel was closed from 1915 to 1918, but its daily average in 1919 was about 1,500 vehicles.

*Architecture.*—During 1920–21 comparatively few additions of importance were made to the architectural glories of London; but it is, perhaps, more strange that the interminable series of aerial bombardments to which it was subjected during the World War left practically no trace on any buildings of public interest. There was really almost nothing to show that London was besieged from the air for four years. The fine old Flemish windows in the chapel of Lincoln's Inn were indeed shattered by a Zeppelin bomb on Oct. 13 1915; but this loss is, perhaps, counterbalanced by the discovery of an unknown Elizabethan façade near St. Bartholomew's church, brought to light by the concussion of another bomb in the same year.

Such new buildings as call for mention here were mainly erected in connexion with schemes of improvement initiated before the World War. The extensive clearances made in and to the N. of the Strand in 1899–1905, chiefly to provide a new approach to Holborn, opened up the view of St. Mary-le-Strand and St. Clement Danes, and created the handsome crescent of Aldwych and the broad new thoroughfare of Kingsway. Among the edifices already erected in the former are Australia House (1911–18), the imposing London headquarters of the Commonwealth of Australia; the Marconi House, and the Gaiety theatre (elevation by Norman Shaw). The Bush House, close by, designed by Harvey Corbett, architect of the Bush building in New York, illustrates (with some restrictions as to height) the merits of American commercial architecture. The substantial buildings of Kingsway belong mainly to the domain of architectural engineering. Prominent among them are the Kodak building and the large office of the Public Trustee (1916). The Wesleyan Central Hall in Westminster is a huge domed building by Lanchester and Rickard (1911), with a fine staircase. Not far off is the Middlesex Guildhall, a Gothic building by J. S. Gibson (1913). The new Ministries of Education, Health, Trade and Works were designed by J. M. Brydon in an Italian Renaissance style and completed in 1919. Across the river, at the other end of Westminster bridge, stands the new London County Hall, designed by Ralph Knott in a Renaissance style. It is one of the largest buildings of modern times, having nine storeys and a river façade of 750 feet. In the City is the new General Post Office (1910), a reënforced concrete building by Sir Henry Tanner. The Royal Automobile Club in Pall Mall was built in 1911 by Mewes & Davis, in a somewhat florid French Renaissance style. Among commercial buildings of importance are the large extension of Selfridge's store by Sir J. Burnet (1921); the extension of Whitcley's in Queen's Rd., Bayswater; the new offices of the Port of London Authority (by T. E. Cooper) and the Metropolitan Water Board (by H. Austen Hall, 1920).

*Monuments and Memorials.*—On Nov. 11 1920, the second anniversary of the Armistice after the World War, in the middle of the roadway of Whitehall, was unveiled the Cenotaph, commemorating in dignified simplicity the "Glorious Dead of 1914–18." It was designed by Sir Edwin Lutyens. Other war memorials include one to Edith Cavell (by Frampton) near Trafalgar Sq., one to London's soldiers (by Sir Aston Webb) in front of the Royal Exchange, and the Monument of Belgium's Gratitude (by J. Rousseau and Sir R. Blomfield) on the Victoria Embankment. In front of Buckingham Palace is the elaborate National Memorial to Queen Victoria, designed by Sir Aston Webb, the sculptures by Sir Thomas Brock. To provide a suitable background for this monument the façade of the E. wing of Buckingham Palace was rebuilt by Sir Aston Webb, while the Mall was widened to provide a "triumphal avenue" to the massive Admiralty arch. Near Westminster Abbey has been erected a replica of St. Gaudens' famous Chicago statue of Abraham Lincoln; and a replica of Houdon's statue of George Washington has been set up near the National Gallery. On the top of the Green Park arch is a fine group of Peace in her quadriga, by Adrian Jones (1912). On the Horse Guards Parade are statues of Lord Wolseley (by Goscombe John) and Lord Roberts (by H. Bates); and similar monuments to Lord Kitchener and Lord Fisher are to follow. Statues of Florence Nightingale (1913) and Captain Scott, the Arctic navigator (1915), have been erected in Waterloo Place; and here, too, is the monument to Edward VII., by Bertram MacKennal (1921).

At the election of 1919 (postponed during the World War) there were returned 68 Municipal Reform (or "Moderates"), 40 Progressive, one Independent, and 15 Labour members.

The Representation of the People Act, 1918, rearranged the boundaries of all the London parliamentary boroughs, except the City of London. It provided that the Administrative County of London should be divided into 61 parliamentary constituencies, the City of London returning two members, the others one each (*see* UNITED KINGDOM). The boundaries of the county electoral divisions are coterminous with those of the parliamentary constituencies.

*Ecclesiastical Divisions.*—To the suffragan bishops must be added those of Willesden (1911), Woolwich (1918) and Kingston (1914). Leading Nonconformist churches were Westbourne Park chapel, Westminster chapel, Christ church (Westminster), King's Weigh House chapel, the Scottish National church, and St. Columba's (Presbyterian). There were in 1921 eight Christian Science churches in London proper, and as many more in extra-London. The headquarters of the Church Army are at 55 Bryanston Street. To the French churches should be added the Huguenot Episcopal church in Shaftesbury Avenue. The Dutch church in Austin Friars is of great historical interest. The church of the Theosophical Society in Tavistock Sq. is a striking building by Sir E. Lutyens. The Catholic Apostolic church in Gordon Sq. is one of the largest and most striking ecclesiastical edifices in London. The number of ecclesiastical parishes is now 633.

*Finance.*—Apart from provisional and temporary measures during the World War there have been no important modifications of the financial government of London since 1911. For the year 1919–20 the total sum raised by the General Rates was £22,104,510, an increase of about 6½ millions over that of 1906–7. The rate for 1920–1 showed an increase of about 10 millions over 1906–7. The total local expenditure of London for 1917–8 (the latest year available) was £30,528,746; the chief items were London County Council £13,512,674; Metropolitan Borough Councils £5,555,217; Board of Guardians £3,427,456; Metropolitan Water Board £2,645,073; Metropolitan Police £2,679,002; City Corporation £1,314,696; Metropolitan Asylums Board £1,330,557. The average rate for 1919–20 was slightly under 10s. in the £, and the estimated rate for the first half-year of 1921–2 about 7s. 10½d. (equal to an annual rate of 15s. 9d.). In 1920 the total ratable value of immovable property in the county of London was £45,638,701 (an increase of 2·3% since 1909).[1] In 1921, however, it rose to £48,708,752 (9·2% over 1909). A penny rate produces over £200,000 (1921–2). The Equalization Fund produces about £1,217,000; but rates still vary from 22s. 10d. in Poplar to 11s. 6d. in Westminster and 10s. 6d. in the City. The estimated income of the London County Council for 1920–1 was £27,535,033; that of the City Corporation in 1919–20 was £211,272. The debts of the London local authorities on March 31 1918 were as follows: London County Council £47,549,550; Metropolitan Asylums Board £1,191,783; Metropolitan Police £74,345; Metropolitan Water Board £39,255,555; Central (Unemployed) Body £1,200; City of London Corporation and Metropolitan Borough Councils £16,190,366; Guardians and Sick Asylum managers £2,048,448 (total £106,311,247, a decrease of 8 millions since 1908). The aggregate capital expenditure by the London County Council and its predecessors down to March 31 1919 was £98,576,171.

*History.*—The history of London after 1900 was largely the chronicle of an interruption or arrest of its normal growth in population, extent, wealth and progress generally. According to the estimates of the registrar-general the increase in population from 1911–20 was relatively small. Between 1911 and 1920 the assessable value increased only by about 2½%, as compared with an increase of 12½% in 1901–11, and of 20% in 1891–1901. The tonnage of shipping entering and clearing the port had not yet regained in 1920 its pre-war figure, though the inflation of values showed an increase in terms of money. With the exception of relatively unimportant extensions no new tubes or tramways had been constructed; new schemes of improvement and extensions in streets, housing, water-supply and the like had been suspended, or only just resumed. The death-rate, which had decreased steadily down to 1912, jumped from 13·6 per 1,000 in that year to 19·2 in 1918, and the birth-rate decreased in a similar proportion. This "arrest," however, had by no means been due to stagnation, because probably no similar period had taken London's citizens more emphatically out of the category of the happy people who have no history and into the realm of excitement and adventure. On May 31 1915, London was startled by the first hostile attack it had experienced for nine centuries; and from then till May 1918 it was the persistent target of German airmen (*see* AIR-RAIDS). In all it was reached 25 times by hostile air-ships (seven raids) and aeroplanes (eighteen raids). No fewer than 922 bombs were dropped within the county of London, of which 355 were incendiary and 567 explosive; 524 persons were killed and 1,264 injured. The material damage has been estimated at over £2,000,000, or about one-fifth of that occasioned by the great fire of 1666. East London suffered most severely. Practically no buildings of historic or artistic value were seriously injured. London's defence, which was increasingly successful, consisted partly of barrage fire from anti-aircraft guns and partly of British "counter-planes." An "apron barrage" of wire trailed from balloons was also tried. Tube stations, church crypts and so on were used as refuges between the "warning" and "all clear" signals. On June 13 1917, a bomb fell on a County Council school at Poplar, killing and injuring a number of children. On March 7 1918, a single bomb destroyed four four-storey houses in Paddington, wrecked two, and seriously damaged twelve others. The greatest financial damage was done by the raid of Sept. 7 1915, when City property to the value of over £500,000 was destroyed by fire. (For particulars of damage done elsewhere than in Poplar by the air raid of June 13 1917, *see* 30.97.)

The war-time restrictions included the great diminution of the lighting of the streets after nightfall; an airship patrol to see that the shading of all lights was properly carried out; the patrolling of voluntary "special constables," taking over many of the duties of the regular police; the multiplication of "flag-days," when little flags were sold in the streets for benevolent purposes usually directly associated with the war; the occupation of the public parks and other open spaces by hutments for one kind or another of Government service, or by allotments cultivated by private citizens for the increase of the national food-supply; the limitation in the transport services, including the closing of several suburban stations; the restriction of private motoring; the queues outside the provision shops; the commandeering by Government of many of the leading hotels and of numerous large private houses, the latter chiefly as hospitals and convalescent homes; the closing of a certain proportion of places of entertainment, and the temporary abandonment or transference elsewhere of some of the chief annual fixtures in the sphere of sport; the closing (total or partial) of the British Museum, National Gallery, and other public collections; the protection of historic buildings by sand-bags, the temporary removal of their treasures, and the substitution of wood for stained glass; the arrangements for the accommodation and support of many thousands of Belgian refugees; the setting apart of the Alexandra Palace and other large institutions as internment camps; the appearance of women as omnibus and tramway conductors (an outward and visible sign of the enormous part played by women during the war in providing substitutes for male labour). Aliens, of course, had to submit in London to the general restrictions, but London never became a "prohibited area."

During the war London and its neighbourhood became the seat of a very extensive production of munitions of all kinds, employing great numbers of women as well as men. One of the unhappy incidents of their activity was the explosion of a munition factory at Silvertown on Jan. 19 1917, followed by a disastrous fire and the loss of 69 lives (400 casualties in all).

Among other London incidents directly connected with the war may be mentioned the anti-German riots of 1914; the execution of Sir Roger Casement at Pentonville on Aug. 13 1916; the execution in the Tower of Carl Lodz (1914), Müller (1915), and other spies and traitors; the march of American troops through London on Aug. 15 1917; the burial of the Unknown Warrior in Westminster Abbey (Nov. 11 1920), the great memorial services in St. Paul's Cathedral in honour of Nurse Cavell (1915); to celebrate America's coming into the war (1917); to render thanks for the restoration of peace (July 6 1919); and the remarkable scenes of rejoicing in the London streets on the proclamation of the Armistice on Nov. 11 1918.

[1] The retardation of growth in ratable value was largely due to the reduction of assessment of licensed premises in 1910.

Among events not due to the war were the death of Edward VII. at Buckingham Palace in 1910, the coronation of George V. at Westminster Abbey in the following year; the "Suffragette" violence of 1914, amply atoned for later in public estimation by the admirable war services of the women suffragists; the first aerial Derby round London on June 6 1914; the more or less abortive police strike of Aug. 1919 (for recognition of their union); the railway strike of Sept. in the same year, when 20,000 motor-cars were assembled in Hyde Park to maintain the supply of milk; the coal-miners' strike of 1921, when the authorities had again to have recourse to emergency measures for public protection; the great advance in the use of oil fuel, largely consequent on the shortage of coal caused by the strike.

Recent excavations in London have brought to light an arch of old London bridge (near St. Magnus' church), fragments of the Roman wall in Moorfields, and a number of 15th century boots and shoes in such good condition that the leather was used by the modern workmen to mend their own footwear; a water conduit of doubtful use and date under Bond St. (possibly of the 17th century, and used as a reservoir for the water of Tyburn); and Roman coins and charred remains of clay and wood in King William St., referred by some authorities to Boadicea's destruction of London in 61 A.D.

BIBLIOGRAPHY.—The chief official publications consulted in the preparation of the foregoing article include the *London Statistics* of the London County Council (vol. 26, 1915–20); James Bird, Clerk of the Council, *Report of the Council to 31st March 1919*; the annual *Accounts of the Corporation of London*; the *Reports of the Port of London Authority* (1910–20); the *Port of London (Consolidation) Act*, 1920; *Reports of the University of London* (1909–21). The *Survey of London*, published by the London County Council and edited by Sir Laurence Gomme and Philip Norman, is on a very extensive scale; the first six volumes had appeared by 1915. The *London Topographical Record*, dealing with special districts, was prepared by the London Topographical Society (10 vols.; 1900–15). *London*, vol. 1, of *English Topography*, edited by Sir L. Gomme (1914); H. H. Harben, *Dictionary of London* (*i.e.* the City) 1917); Sir L. Gomme, *Making of London* (1914); *London of the Future* (1921), prepared by the London Society, includes contributions from Sir Aston Webb, Lord Crewe, Lord Montagu of Beaulieu, Sir Reginald Blomfield, and many other authorities.

Small descriptive works include E. V. Lucas, *A Wanderer in London* (14th ed. 1913) and *London Revisited* (1916); Wilfred Whitten, *A Londoner's London* (1913); Mrs. E. T. Cook, *Highways and Byways in London* (1911); G. R. S. Taylor, *Historical Guide to London* (1911); St. John Adcock, *Famous Houses and Literary Shrines of London* (1912) and the *Booklover's London* (1913); P. H. Boynton, *London in English Literature* (1913). The *Blue Guide to London and Its Environs*, edited by Findlay Muirhead, is a useful compendium (2nd ed. 1921). Convenient short histories are those by K. H. Vickers (1914) and Claud Mullins (1920); its government is explained in Percy A. Harris's *London and Its Government* (1913).

The following refer to special districts, periods or features: E. Beresford Chancellor, *The 18th Century in London* (1920); Arthur Irwin Dasent, *Piccadilly in Three Centuries* (1920); W. H. Godfrey, *History of Architecture in London* (1911); Hilaire Belloc, *The River of London* (1913); W. G. Bell, *Unknown London* (1920); *More About Unknown London* (1921); Will Owen, *Old London Town* (1921); L. Wagner, *A New Book About London* (1921); Margaret E. Tabor, *The City Churches* (1917); Thomas Burke, *Nights in Town* (1915); *Limehouse Nights* (1917); and *The Outer Circle* (1921).

(J. F. M.)

**LONDONDERRY, CHARLES STEWART VANE-TEMPEST-STEWART,** 6TH MARQUESS OF (1852–1915), British Unionist politician (*see* 16.969), was a prominent leader of the opposition to the Home Rule bill introduced by the Asquith Government in April 1912. He was one of the first Unionists to sign the Ulster covenant Sept. 28 1912, and subscribed largely to the funds accumulated by the Irish Unionists. Lord Londonderry was one of the largest coal-owners in the north of England, and by his energy and business capacity greatly increased the value of his property. He died at Wynyard Park, Stockton-on-Tees, Feb. 8 1915. Lord Londonderry married in 1875 Lady Theresa Chetwynd Talbot, elder daughter of the 19th Earl of Shrewsbury, who was well known for her philanthropic and political work and also as a brilliant hostess. During her residence in Ireland Lady Londonderry did much for the promotion of Irish industries, and in later life she completely identified herself with her husband's activities on behalf of the Unionist cause. She died in London March 16 1919.

Their eldest son, CHARLES STEWART HENRY VANE-TEMPEST-STEWART, 7th Marquess of Londonderry (1878– ), was born in London May 13 1878. He was educated at Eton, and afterwards entered the Royal Military College at Sandhurst. As Viscount Castlereagh he entered the House of Commons in 1906 as Unionist member for Maidstone. He served during the World War, and in 1915 succeeded his father as 7th marquess. He married in 1899 Edith, daughter of 1st Viscount Chaplin, who did much valuable work during the World War as the originator of the Women's Legion. She founded the corps of "Domestic Legionaries," as an attempt to solve the problem of domestic service, and in 1917 was created D.B.E.

**LONG, JOHN DAVIS** (1838–1915), American lawyer and politician (*see* 16.974), died at Hingham, Mass., Aug. 28 1915.

**LONG, WALTER HUME LONG,** 1ST VISCOUNT (1854– ), English statesman, born at Bath July 13 1854, was the eldest son of Richard Penruddocke Long, of Rood Ashton, Wilts., and Dolforgan, Montgomeryshire, and his wife, Charlotte, daughter of the Right Hon. W. W. Fitzwilliam Hume Dick. He was educated at Harrow and Christ Church, Oxford. Being the representative of an old county family with a tradition of Parliamentary service it was natural that he should contemplate a political career. He entered the House of Commons in 1880 as Conservative member for N. Wilts., and sat in every Parliament since till he was created a peer in May 1921, though he changed his constituency several times. The Reform Act of 1884 abolished his first constituency, so in 1885 he became member for the Devizes division of the county. From 1892 to 1900 he sat for W. Derby, Liverpool, from 1900–6 for S. Bristol, from 1906–10 for Dublin county, S., from 1910–18 for the Strand division of London, and after 1918 for St. George's, Westminster. He early showed interest in, and knowledge of, questions of local administration, especially in country districts; and was accordingly appointed Parliamentary secretary of the Local Government Board in 1886. The industry, capacity and common sense which he showed in his six years' tenure of this office marked him out for promotion when his party returned to power. Accordingly in 1895 he became president of the Board of Agriculture, remaining for five years, and then for the five following years he was president of the Local Government Board. His administration at the Board of Agriculture was marked by the stamping out of hydrophobia through the strict enforcement of a muzzling order for dogs, and the tenacity and resolution which he showed in carrying his policy through, in the face of a violent agitation by many dog-owners and dog-lovers, raised him greatly in public esteem.

Hitherto Mr. Long, despite his administrative efficiency, had not counted for much in the main party struggle. But in March 1905 he emerged into the limelight, being chosen by Mr. Balfour to succeed Mr. Wyndham, after the latter's breach with Irish Unionism, as Chief Secretary for Ireland. He at once restored Unionist confidence by reducing the under-secretary, Sir Antony MacDonnell, afterwards Lord MacDonnell, to definite subordination to himself as the responsible minister, and by the firmness with which he proceeded to enforce the law and repress agrarian intimidation. At the same time he proclaimed that his policy was to redress legitimate grievances, and to give everybody justice and fair play. The impression which he produced in Ireland in the few months before Mr. Balfour's resignation was so considerable that he, an Englishman, was returned to Parliament in the general election of 1906 as member for the S. Dublin division. In the years of Opposition which followed he proved a vigorous opponent of Mr. Birrell's policy of *laisser-faire* in Ireland and of Mr. Lloyd George's proposals with regard to the land, and a more benevolent critic of the Government Old-Age Pension scheme and of Mr. Burns's administration at the Local Government Board. When Mr. Balfour resigned the leadership of the Unionist party in Nov. 1911 he was the candidate of the more conservative branch of the party; but both he and Mr. Austen Chamberlain, his rival, agreed to

stand aside in favour of Mr. Bonar Law. In the years immediately following Mr. Long was not very prominent in Parliament, though he took his share in the determined opposition to the Home Rule bill. But he had the respect of all parties, as the chief representative in public life of old-fashioned conservatism and the "agricultural interest."

With the other Unionist leaders he joined the first Coalition Ministry in 1915, returning to his old post of president of the Local Government Board. In that capacity he carried bills for national registration for suspension of municipal elections, and for restriction of the raising of rent on small houses, and took a leading part in pressing upon the House the military service bills of 1916. In the second Coalition Ministry he was Secretary of State for the Colonies. He had been hitherto a decided opponent of woman suffrage, but he was converted by the services of women during the World War, and in 1917 he introduced in the House of Commons the Franchise bill, which became law in the following year, and under which women over 30 obtained the franchise. When Mr. Lloyd George reconstructed his Ministry in the beginning of 1919 Mr. Long became First Lord of the Admiralty and had the difficult task of supervising the reduction to a peace basis of the gigantic navy which had been built up during the war. He refused to be rushed into precipitate action either by the challenge of the United States and Japan, who both started large schemes of shipbuilding, or by the clamour of the enthusiasts for air-warfare who proclaimed that battleships had become useless, but announced in the Estimates of 1921 a moderate programme of four new battleships. For some years his health had been periodically unsatisfactory, and in the spring of 1921 he resigned office. Mr. Bonar Law's breakdown in health occurred immediately afterwards, and Mr. Long heartily supported the election of his old rival, Mr. Austen Chamberlain, to the leadership of the Unionist party in the House of Commons. A few months later he was raised to the House of Lords, amid general approval, as Viscount Long of Wraxall.

He had married in 1878 Lady Doreen Boyle, daughter of the 9th Earl of Cork and Orrery. His elder son, Brig.-Gen. Walter Long, C.M.G., D.S.O., served in the S. African War, and fell in action in France in Jan. 1917 at the head of his brigade.

(G. E. B.)

**LOREBURN, ROBERT THRESHIE REID,** 1ST EARL (1846– ), British lawyer and politician, was born at Corfu April 3 1846, and was educated at Cheltenham and Balliol College, Oxford, where he had a distinguished career, winning the Ireland scholarship in 1868. He was called to the bar in 1871, and in 1880 entered politics as Liberal member for Hereford. In 1882 he became a Q.C., and having in 1885 lost his seat at Hereford, was returned in 1886 for Dumfries Burghs, retaining the seat until 1905. In 1894 he was for a few months Solicitor-General and was knighted, and during 1894–5 was Attorney-General. From 1899 to 1906 he was counsel to the university of Oxford. On the formation of Sir Henry Campbell-Bannerman's Government in 1905, Sir Robert Reid became Lord Chancellor, and was raised to the peerage as Baron Loreburn. To him, while Chancellor, the passage of the Court of Criminal Appeal Act (1907) was largely due. In 1912 he resigned on grounds of health. Lord Loreburn was created an earl in July 1911. He published *Capture at Sea* (1913) and *How the War Came* (1919).

**LORIMER, SIR ROBERT STODART** (1864– ), Scottish architect, son of Prof. Lorimer of Edinburgh University, was born at Edinburgh Nov. 4 1864. After an education at the Edinburgh academy, and then at the university, Lorimer entered the office of Sir Rowand Anderson as a pupil, at the age of 21. Here he passed some four or five years, and after travelling in England for study he spent upwards of two years in the London office of G. F. Bodley, R.A. Under his guidance Lorimer's predilection for Gothic work—fostered by subsequent travel abroad—received the encouragement that fitted him for the church work which, later, played so large a part in his career. In 1893 he returned to Edinburgh to undertake the restoration of Earlshall, Lewchars and other commissions. This was the beginning of a large series of additions and restorations he was called on to carry out—amongst them Dunderaw and Monzie castles and Pilkerro in Scotland; Lympne Castle, Kent; and Barton Hartshorne, Bucks. His domestic work, apart from restorations and alterations, included new houses at Ardinglar, Argyllshire, Cupar, Fife; Hallyburton; Brackenbrough in Cumberland, and St. Marnock's, co. Dublin. Throughout his restoration design there is evident a full acquaintance with, and feeling for, the methods and principles of the earlier builder, without too close and academic an adherence to them. A great opportunity was afforded him in 1909 in his design for the new chapel of the Knights of the Order of the Thistle, on the south side of St. Giles's cathedral, Edinburgh, the chief example of his skill and architectural ability. The large sum of money left by Lord Leven and Melville for the restoration of the chapel at Holyrood Palace it was found impossible to utilize for that purpose, and on its reversion to the estate his heir, with great generosity, devoted the amount to the building of a new chapel for the use of the Order, and for this Lorimer was appointed architect. This building, small but highly ornate and enriched with carefully conceived detail, gave him the opportunity of giving to Scotland a worthy modern example of ecclesiastical woodwork to add to its only existing specimens of any importance—the few stalls at Dunblane cathedral, and the woodwork in King's College, Aberdeen. It was in connexion with this fine work that, in 1911, he was knighted. He also designed a large number of churches, and fitted many others with screens, organ-cases, and choir-stalls. In 1920 he was elected Associate of the Royal Academy and in 1921 a member of the Scottish Academy.

**LOS ANGELES,** California (*see* 17.12), increased in its population more than 80% in the period 1910–20, reaching 576,673, surpassing San Francisco, and changing from sixteenth to tenth place among the cities of the United States. The area of the city increased more than fourfold, being 365·67 sq. m. in 1920. In 1910 Hollywood (4·45 sq. m.), East Hollywood and Ivanhoe (11·11 sq. m.) were annexed, and in 1912 Arroyo Seco (6·9 sq. m.). In 1915 168 sq. m. of San Fernando Valley and 4 sq. m. of the Palm District was annexed. In 1910 there were 22 parks with 3,800 ac.; these had increased by 1920 to 25 parks with 4,100 acres. The playground department, established in 1911, maintained in 1920 12 playgrounds and 34 summer centres at a cost of $207,836. Three summer camps for family outings in the mountains were supported by the municipality. In 1910 builders' permits were granted for buildings valued at $21,684,100; in 1920 the value was $60,023,600. The museum of the Southwest Society of the Archaeological Institute of America began in 1912 its first group of buildings. A new museum was added by a building at Exposition Park.

Los Angeles has maintained its position as a winter resort. During 1910–20 it became predominantly an industrial rather than an agricultural centre, though agriculture, which had hitherto been its chief economic interest, continued to furnish a large share of the city's prosperity. In 1919 the value of all farm products in Los Angeles county was $426,045,843, an amount greater than that for any other county in the United States. The chief products were citrus fruits, valued at $80,140,000. There were 13,013 farms in 1920, against 7,919 in 1910.

*Communications.*—In 1912 only half-a-dozen steamship lines were in operation between Los Angeles and other coast ports, with a few lines to Mexico, Central America, and Hawaii. By 1920 direct lines were in operation to the Orient, the Philippines and the Straits Settlements. On Jan. 31 1921 there were 34 marine services reaching more than 100 important ports throughout the world. Steamship travel to and from Los Angeles more than doubled in 1919. The urban and suburban electric railways had in 1920 over 591 m. of single track within the city and 1,095 m. outside its limits, extending to points 72 m. distant.

During 1909–20 the Federal Government spent approximately $6,000,000, and the city of Los Angeles $5,800,000, in improving the harbour, Port San Pedro. The arrangement of U.S. pierhead lines as established in 1920 permitted approximately 24 m. of wharf frontage; 35,283 ft. was already improved, of which the city owned and operated 13,315 ft.

*Education.*—There were in 1920 over 800 public and over 140 private schools and colleges in the city. The value of school property

was nearly $19,000,000; the enrolment 115,530, and the teaching force 5,147. The university of California organized in Los Angeles a southern branch, providing a two-year course. The public library in 1920 contained 383,925 volumes with a home circulation of 2,581,214, and there were 12 branches, 24 sub-branches, and 139 depositories with 14,792 volumes.

*Industries and Commerce.*—In 1914 Los Angeles was the twenty-sixth city in the United States in value of manufactured products; in Jan. 1921 an estimate showed it to be tenth. In 1912 the value of the manufactured products was $85,000,000. In 1919 according to an estimate of the Los Angeles chamber of commerce there were 3,300 establishments representing an investment of $400,000,000 and producing a product valued at $618,772,500. The chief industries with the value of their products were motion-picture films, $150,000,000, 80% of the world's supply; petroleum refining, $83,000,000; shipbuilding, $68,000,000; meat-packing, $42,000,000; food products, $41,000,000; garment manufacture, $30,000,000; iron and steel, $25,000,000; automobiles and accessories, $21,000,000; and railway car construction, $20,000,000. In 1919 Southern California produced 102,000,000 bar. of crude oil, Los Angeles being the centre for this industry. In 1914 there were 2,100 oil wells in the city. Bank clearings increased from $942,914,424 in 1911 to $3,994,280,518.83 for 1920. The post-office receipts during the same period increased from $1,646,601.84 in 1911 to $4,180,057.70 for 1920. The assessed valuation of property of Los Angeles in 1920 on a 50% basis was $636,147,965. The most important event in the economic development of Los Angeles was the building of the municipal aqueduct, placed in operation Nov. 5 1913. It is capable of furnishing water to over a million population and a surplus to irrigate 135,000 ac., and also sufficient for all demands of industry. The fall in the aqueduct is used to develop electric power. In 1917 a plant of 37,500 H.P., and in 1919 one of 28,000 H.P. was thus supplied. In the decade 1910–20 Los Angeles developed from a port of relative unimportance to one of the leading ports on the Pacific coast, though the immediate increase in shipping and industry which the city expected as a result of the completion of the Panama Canal did not materialize. This was partly due to the unusual conditions arising from the World War. Since 1918 the city's commerce has increased remarkably. The value of its foreign exports in 1912 was $235,460, in 1919 $10,496,172, and in 1920 $18,606,121, the latter an increase of 80% over 1919. The imports in 1912 were $1,710,127, in 1919 $3,218,490 and in 1920 $9,724,217, the latter an increase of 206% over 1919. (R. A. V.)

**LOUIS [LUDWIG]**, Ex-King of Bavaria (1845–1921), assumed the regency in succession to his father on Dec. 12 1912. In accordance with the bill passed by the Bavarian Diet he assumed the crown on Nov. 5 1913 (King Otto, who had been kept in confinement as a lunatic, died on Oct. 11 1916). On the afternoon of Nov. 7 1918, the King was taking a walk with his daughters in the Englischer Garten, unconscious of the fact that the Socialist demonstration organized by Eisner on the Theresienwiese was developing into a revolution. A plain man of the people met the King and said to him: "Get home as quickly as you can, your Majesty, things are not going well." Later in the evening the monarch was informed by his ministers that the republic had been proclaimed. With the Queen and his daughters the King promptly left Munich in one of his motor-cars, the whole luggage consisting of a few handbags. The royal family resided first at Berchtesgaden, and afterwards at a castle assigned to them on the shores of the Chiem See. On Nov. 13 he formally signed his abdication, and relieved all Bavarian officials, officers and soldiers from their oath of allegiance. He died at Sarvar, Hungary, Oct. 17 1921.

**LOUISIANA** (*see* 17.53).—The pop. of the state in 1929 was 1,798,509 as compared with 1,656,388 in 1910, an increase of 142,121, or 8·3% for the decade. During 1910–20 negroes decreased from 713,874 to 700,257, or from 43·1% of the total pop. to 38·9%. The percentage of urban pop. increased from 30·0 in 1910 to 34·9 in 1920. Owing to the size of its principal city, New Orleans, Louisiana had a larger percentage of urban pop. than any other Southern state, except Florida.

The cities having a pop. of over 10,000 in 1920 and their percentage of increase were as follows:—

| | 1920 | 1910 | Increase per cent. |
|---|---|---|---|
| Alexandria | 17,510 | 11,213 | 56·2 |
| Baton Rouge | 21,782 | 14,897 | 46·2 |
| Lake Charles | 13,088 | 11,449 | 14·3 |
| Monroe | 12,675 | 10,209 | 24·2 |
| New Orleans | 387,219 | 339,075 | 14·2 |
| Shreveport | 43,874 | 28,015 | 56·6 |

*Agriculture.*—The most important industry of the state has always been agriculture. The total value of all farm crops in 1919 as reported by the Bureau of the Census was $206,182,548 as compared with $73,536,538 reported by the same bureau in 1909. The total number of farms in 1920 was 135,463, representing a gain of 14,917 during the preceding decade. Cotton, sugar-cane, corn, rice, hay and forage in the order named constitute the most important field crops. The advent of the boll weevil in the state in 1908 resulted in a sharp decline in the production of cotton and in the introduction of more diversified farming in the parishes where cotton had constituted the principal crop. The effect of this pest on cotton production is shown by the decline in the yield from 675,000 bales in 1908 to 246,000 bales two years later. By 1917, however, with improved methods of production and the stimulus of high prices, the output had increased to 639,000 bales, to fall again in 1918 to 588,000, and in 1919 to 307,000. With the development of diversified farming the yield of maize (Indian corn) steadily increased, being 28,800,000 bus. in 1918 and 21,676,000 in 1919. The live-stock industry also gained in importance. The production of rice in 1919 was 16,011,000 bus., with a farm value of $42,751,000. Practically all the cane sugar produced in the United States came from Louisiana. The trucking industry has attained considerable importance in the vicinity of New Orleans, and the raising of strawberries has proved profitable and is being steadily extended in the cut-over pine lands of Livingston and Tangipahoa parishes. Citrus fruits are grown in considerable quantity along the Mississippi river below New Orleans.

*Manufactures.*—The production of lumber is the leading manufacturing industry of the state. In 1914 the lumber and timber products had a value of $66,656,268, Louisiana ranking second among the states. The manufacture of sugar, including refining and the production of molasses, came second with total products valued at $57,948,322. There was a considerable variation in the output of cane sugar, as the following figures in short tons indicate: 1915, 137,500; 1916, 303,900; 1917, 243,600; 1918, 280,900; 1919, 115,590; 1920, 169,126. The production of cotton-seed oil and cake and the cleaning and polishing of rice occupied third and fourth places in the state's manufactures, with products valued in 1914 at $18,106,257 and $12,966,690 respectively. The refining of petroleum has attained increasing importance in recent years.

*Minerals.*—Louisiana leads all other states in the production of sulphur, and in 1917 was third in the production of rock salt. Both the sulphur and rock-salt deposits lie in the southern portion of the state and yield a product of unusual purity. The south-eastern limit of the mid-continental petroleum field lies in the north-western section of the state, in the parishes of Caddo, Red River, De Soto and Claiborne. The Gulf Coast oil-field reaches into the state from the S.W., and is most productive in the vicinity of Vinton, Jennings and Anse La Butte. The state's output in 1920 was 35,649,000 bar.; in 1918, 15,423,520. In 1920 the live stock on farms was valued by the Department of Agriculture at $120,000,000 as compared with $43,315,000 in 1910.

*Administration.*—On March 1 1921 a constitutional convention assembled at Baton Rouge to draft a new constitution which, on its adoption, would become the tenth under which the state has been governed since its admission to the Union in 1812, not including the constitution of the Confederate period, 1861–5. The constitution of 1913, the immediate predecessor of that of 1921, was not, strictly speaking, a new instrument, but was mainly a textual revision of the constitution of 1898 by the incorporation into the body of the document of some 60-odd amendments which had been adopted in previous years and had become so numerous as to create confusion. Other than this change in form, the 1913 constitution included no new material except provisions for refunding the state debt, due Jan. 1 1914, and for the prevention of combinations in restraint of trade. Owing to the many restrictions of a statutory nature included in the constitution of 1898, it was found necessary to submit a large number of amendments to the voters after nearly every biennial session of the Legislature. This defect was not avoided in the constitution of 1913. Consequently in Nov. 1916 18 constitutional amendments were submitted to the voters, and 17 were adopted. In Nov. 1918 14 more were submitted, and 13 were adopted. This constant addition of amendments proved both costly and confusing, and was one of the chief factors in bringing about the movement for the adoption of a new constitution in 1921.

*Education.*—Material improvement in the provision for the educational institutions of the state was effected in 1918 and 1920. In the former year five constitutional amendments were adopted which resulted in more than doubling the state and local revenues for the support of the public schools. A special tax was also provided for the support of the institutions for higher education. In 1920 a special tax of 2% on the value of all natural products from the land—oil, natural gas, sulphur, salt and lumber—was imposed to create a fund for the maintenance of the state institutions, and the proceeds of this tax were appropriated the following year for the physical equipment of the College of Agriculture, which is one department of the Louisiana State University. In 1916 the system of compulsory education according to the option of each parish gave way to a state-wide compulsory education law requiring a minimum attendance of 140 days at school in each school year by all children between the ages of 7 and 14 years. There has been difficulty, however, in

the strict enforcement of the law, and in 1919 there were 87,000 whites and 128,000 negro children of school age not enrolled in the public schools. The total expenditures from all sources on the public-school system in 1919 amounted to $9,702,067 as compared with $7,954,552 in 1918, and $4,310,100 in 1910. In 1919 21·4% of the school revenues were derived from the state Government, 41·6% from general parish resources, 32·7% from special maintenance taxes, and 4·3% from bond issues. The average salary for white male teachers was $1,011, as against $758 for the previous year, and for white female teachers $598, as against $526 for the previous year. In 1919 negro male teachers received an average salary of $298 and female teachers an average of $217.

*Taxation.*—From 1908 to 1916 the reform of the system of taxation was the most important public question within the state. A special tax commission created by the Legislature in 1908 reported a plan for the separation of the sources of state and local revenues, but no action was taken then. In 1912 a second tax commission drafted a more elaborate plan, providing separate sources of revenue for the state and local Governments and including a provision for an inheritance tax with highly progressive rates. This was submitted to the voters by the Legislature in the form of a constitutional amendment, and was rejected by a large majority. In 1916 a new plan providing separate assessments of the same property for state and local purposes was submitted as a constitutional amendment and adopted. This amendment provides a board of three members, designated the Board of State Affairs, which is charged with the duty of securing an equalized assessment of property throughout the state, and with the preparation of a state budget. The Board of State Affairs also supplanted the State Board of Equalization and the State Board of Appraisers, the latter having had control of the assessment of the property of railway, telegraph, telephone, sleeping-car, and express companies. Under the new system the local or parish authorities may take as the basis for local taxes any fraction, not less than 25%, of the state assessment of general property. At the close of the fiscal year 1919 the state's finances were in satisfactory condition, with receipts aggregating $17,035,351 and expenditures $14,504,468. The bonded debt on March 1 1920 was $11,108,300.

*History.*—Although the state is normally Democratic, the reduction of the duty on raw sugar by the Tariff Act of 1913, framed by a Democratic Congress, caused a defection from that party in that section of Louisiana where the production of cane sugar is the chief industry, and this resulted in the election in 1914 of a candidate to Congress from the Third Congressional District on the Progressive ticket. For a short period this party showed considerable strength in the southern portion of the state. In the gubernatorial election in 1916 many regular Democrats supported the Progressive candidate, but the Democrat was elected by a majority of 32,000. The Democratic party in this election, however, polled some 25,000 fewer votes than were cast for its candidates in the preceding primary election. Inasmuch as many Democrats had voted the Progressive ticket in the regular election after participating in the primary election of their own party, the Democratic Legislature in 1916 enacted new primary and general election laws. These measures stipulated that all officially recognized political parties must nominate their candidates by means of primary elections, and that all such elections must be held on the same day. Every voter was required to register his party affiliation in order to obtain the privilege of participating in a primary election, and was required to sign a pledge to support the nominee of the party with which he registered his affiliation. Violation of this pledge was made a misdemeanour subject to legal penalties. In 1920 John M. Parker, who had been the unsuccessful Progressive candidate for governor in 1916, was nominated for the same office on the Democratic ticket and was elected. Practically all the members of the Progressive party had by this time rejoined the Democratic party.

The governors after 1908 were: Jared Y. Sanders, 1908–12; Luther E. Hall, 1912–6; Ruffin G. Pleasant, 1916–20; John M. Parker, 1920.

During the World War the total state registration under the selective draft regulations was 392,316, and the number inducted into service was 80,834. The total amount subscribed in the state to war loans was $154,071,000. (W. O. S.)

**LOUVAIN** (*see* 17.67).—Pop. 42,490 in 1914, as against 42,194 in 1904. The Germans entered Louvain Aug. 19 1914. The city was systematically sacked and in large part destroyed by fire between Aug. 25 and Sept. 2. About one-third of the city perished, including the famous University Library with its treasures, the church of St. Pierre and the markets. About 300 civilians, many of whom were shot, lost their lives.

The destroyed fabrics were in process of reconstruction (as far as might be) in 1921, and about 700 out of 1,200 houses had been rebuilt. The foundation stone of the new library was laid July 28 1921 in the presence of the King and Queen of the Belgians. A clause of the Peace Treaty provides that Germany should make reparation for the burning of the library by furnishing books, MSS., etc., to the value of those destroyed. Great Britain (on the initiative of the John Rylands Library, Manchester) and the United States contributed largely to its replenishment; over 38,000 books had been sent to Belgium from the John Rylands Library up to Aug. 1921.

**LOW, SETH** (1850–1916), American administrator and educationist (*see* 17.72), died at Bedford Hills, N.Y., Sept. 17 1916. In 1914 he was appointed by President Wilson as one of the arbitrators in the Colorado coal strike. He was delegate-at-large to the New York State constitutional convention in 1915, and was chairman of the committee on City government.

**LOWDEN, FRANK ORREN** (1861– ), American politician, was born at Sunrise City, Minn., Jan. 26 1861. After studying at Iowa State University (A.B. 1885) and the Union College of Law, Chicago (LL.B. 1887), he practised in Chicago for about 20 years. In 1899 he was professor of law at Northwestern University, Evanston, Illinois. In 1900 he declined the first assistant postmaster-generalship, offered him by President McKinley, whom he had supported. He was a delegate to the Republican National Convention in 1900 and 1904, and from 1904 to 1912 was a member of the Republican National Committee. He was also a member of the executive committee in 1904 and 1908. In 1906 he was elected to the U.S. House of Representatives for the unexpired term of R. R. Hitt, deceased, and was re-elected for the terms of 1907–11. He declined to run for another term. He was governor of Illinois 1917–21, and was energetic in marshalling the resources of his state in support of America's war programme. In 1917, when the mayor of Chicago refused to interfere with a meeting of the People's Council, an organization accused of pro-Germanism, he ordered out the state troops to prevent the meeting. He introduced the budget system for state expenditure, thereby reducing the rate of taxation in spite of rising prices. He favoured woman suffrage and the enforcement of the Volstead Act for war-time prohibition. He was opposed to the League of Nations without reservations, on the ground that it would create a super-state. At the Republican National Convention in 1920 he had strong support for president. In the first four ballots he stood second; on the fifth he led with 303 votes (493 being necessary for nomination); on the sixth he tied for first place (311½ votes); on the seventh ballot he was second (311½ votes); on the eighth he again led (307 votes), but then to avoid a prolonged deadlock he released his delegates, who transferred their votes to Warren G. Harding, who was nominated on the tenth ballot.

**LOWELL, ABBOTT LAWRENCE** (1856– ), American educationist (*see* 17.73), built for Harvard at his own expense a president's house, which was finished in 1912. From the time that he became president (1909) he took great interest in the social life of the students, and was specially desirous that members of the entering class should have the opportunity of becoming thoroughly acquainted. The result was the erection of an attractive group of dormitories in which all freshmen roomed and had their meals together (*see* also HARVARD UNIVERSITY). President Lowell was a strong supporter of free speech among the members of the faculty. After the outbreak of the World War in 1914 he refused to accept, in spite of considerable pressure, the resignation of Prof. Hugo Münsterberg, who had defended the German cause. In 1915 Prof. Kunó Meyer, of the university of Berlin, a prospective exchange professor to Harvard, sent a letter of protest because of the publication in one of the college magazines of a satirical poem, *Gott mit Uns*, by an undergraduate. In his reply President Lowell pointed out that freedom of speech was an important characteristic of American universities as distinguished from those in Germany. He was chairman of

the executive committee of the League to Enforce Peace, and later was a strong supporter of the League of Nations.

He was the author of *Public Opinion and Popular Government* (1913, based on lectures at Johns Hopkins University); *The Governments of France, Italy, and Germany* (1914, abridged from his earlier *Government and Parties in Continental Europe*) and *Greater European Governments* (1918, abridged from earlier works).

His brother PERCIVAL LOWELL (1855–1916), American astronomer (*see* 17.73), died at Flagstaff, Ariz., Nov. 12 1916. In 1910 he lectured in London before the Royal Institute and in Paris before the Association Astronomique.

His sister AMY LOWELL (1874– ), American poet, was born in Brookline, Mass., Feb. 9 1874. She was an accomplished writer of *vers libre* and well known as a critic.

Her works include *A Dome of Many-Colored Glass* (1912); *Sword Blades and Poppy Seed* (1914); *Six French Poets* (1915); *Men, Women, and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921); *Fir-Flower Tablets* (1921), translations from the Chinese, with the collaboration of Florence Ayscough.

**LOYSON, CHARLES** (1827–1912), better known as "Père Hyacinthe," a famous French preacher, was born at Orleans in 1827. He was educated for the priesthood and entered the Carmelite order. His eloquence drew all Paris to his Advent sermons in Notre-Dame between 1865 and 1869, but his orthodoxy fell under suspicion, and in 1870 he associated himself with Döllinger's protest against the dogma of Papal infallibility (*see* 14.512, 20.67). Being excommunicated, he broke finally with the Church of Rome, and removed first to Geneva and then to London. He married an English lady, Emily Jane Merriman, and settled in Paris in 1877, where he founded an Old Catholic church. He died in Paris Feb. 9, 1912.

**LUCK (LUTSK), BATTLES OF, 1916.**—The battles in the World War which constituted the Russian summer offensive of 1916 are known collectively by the name of Luck (Lutsk), a town in Volhynia, on the river Styr, which before the war formed part of the Russian fortified region of Rovno. The choice of this point as indicative of a series of great battles which extended in space from the river Pripet to the frontier of Rumania and in time from early June to late Aug.—and, with decreasing intensity, into Nov.—is justified by the fact that the break-through of the Austrian front at Luck was the principal factor in determining the course of the whole series.

After the fruitless attacks of the Russians in Courland and Lithuania in March 1916, a perceptible lull had set in on the eastern front. It was nevertheless obvious to the Central Powers that Russia was preparing for a new trial of strength. Their artillery, in particular, which had been augmented in comparison with the previous year, was initiated into all the intricacies of the newest fire-tactics, French and Japanese instructors being employed in some cases. A very ample supply of ammunition was accumulated, and air reconnaissance and aeroplane photography were brought to a high pitch. The general attack of the Entente was planned for July 1.

*Brussilov's Offensive.*—From the disposition of the Russian troops in May 1916, it was assumed that they would repeat their attacks against the former pressure-points on the German front, N. of the Pripet, viz.: at Baranovichi, Smorgon, Lake Naroch and Dvinsk. But the Austro-Hungarian offensive against Italy made it imperative for Russia to go to the relief of her ally, and accordingly General Brussilov was called on to take the offensive against the front S. of the Pripet, which was almost entirely occupied by Austro-Hungarian troops. However, no troops were shifted at first from the area N. of Pinsk to the Russian S.W. front. Brussilov's command included the following:—the IX. Army (Letchitsky), with 10–11 inf. divs. and 2–3 cav. divs., from the Pruth E. of Czernowitz along the Bukovina-Bessarabia frontier and on the N. bank of the Dniester to the N. of Uscieczko; the VII. Army (Shcherbachev), with 6–8 inf. divs. and 2½ cav. divs., generally on the E. bank of the Strypa as far as Bohatkowce; the XI. Army (Sakharov), with 8 inf. divs. and 1 cav. div., from the upper course of the Strypa across the watershed between Sereth and Horyn (Goryn) to the E. bank of the upper Ikwa as far as the N. of Kremieniec; finally, the VIII. Army (Kaledin), with 12–13 inf. divs. and 3 cav. divs., on the E. bank of the Ikwa to Mlynow, from there through gently undulating country to the Putilowka, N. of Olyka, thence to the bend of the Styr between Kulikowce and Kolodia, and on through the marshy regions W. of the Styr along the Wiesiolucha to the Pripet.

The Austro-Hungarian Higher Command looked forward with confidence to the next battle on the eastern front. For although the offensive against Italy had meant the removal of five good attack divisions and much heavy artillery to the Tirol, the regiments, excepting those of the VII. Army, had been brought up to full fighting strength again by the march battalions that were drafted to them monthly, some of them being even in a position to form supernumerary companies or battalions. Compared with the previous year the number of guns had also been increased through the development of the general artillery organization. But the allocation of ammunition was meagre. Much time and labour were spent on organizing the positions. The defence system consisted for the most part of three positions, which were supposed to be at such a distance apart that, after the failure of the first position, the battle for the second position would require a new movement of the enemy's artillery. The first position, which again consisted of two or three lines, each behind the other, was in fact very well organized. But for the construction of the rearward positions there was not enough labour, time or wire left over. They were therefore incomplete.

The plan for the defence was conceived to be that the troops were to stand by, during the very violent artillery demolition fire that was expected, in deep dug-outs (so called "fox holes") either near the front line or actually in it. As soon as the enemy infantry rushed to the attack the defenders, promptly warned by observers, were to hurry into the fighting trenches, while their own artillery by barrage-fire (where possible, oblique) mowed down the storming enemy infantry, or at least prevented the enemy reserves from following up. In this way the troops in the trenches would have only the first rush of the enemy's attack to beat back in hand-to-hand fighting. These tactics were open to serious objections. Timely detection of the moment when the enemy's storming columns should break forth, and consequently the instant alarming of the garrison in its dug-outs, as also the instantaneous putting down of the barrage, could not be counted upon, in view of the destruction of observation and liaison by the hostile drum-fire. Further, the defence was concentrated far too rigidly on the fighting in the front line, the loss of which would mean also the loss of the greater part of the fighting material there, such as machine-guns, trench mortars, flame-throwers, searchlights, flanking guns, etc. The troops' power of resistance was bound up far too closely with the possession of the foremost position.

The calm assurance with which the Russians went about their attack preparations, which were plain to see but impossible to hinder, induced such a state of nervousness in the staffs and troops of the defence that the launching of the Russian attack would have been felt almost as a relief had it not been for the annihilating results of the attacks at various points.

On the part of the front under the Austro-Hungarian Army Higher Command, stretching from the Pruth to the Jasiolada N. of Pinsk, there were:—(1) VII. Army (Pflanzer-Baltin), with the XI. Corps, Benigni's and Hadfy's groups, the XIII. and the VI. Corps (12 inf. divs. and 5 cav. divs.), from the Pruth E. of Czernowitz to Wisniowczyk on the Strypa; (2) the German South Army (Graf Bothmer), which now contained only 1 German inf. div., the 48th Res. Div. with Hoffmann's Corps and the IX. Corps (6 inf. divs.), along the middle Strypa and as far as Czerniechow on the upper course of the Sereth; (3) the groups of armies of Generaloberst von Böhm-Ermolli, comprising the Austro-Hungarian IV. and V. Corps and Kosak's group (5 inf. divs. and 1 cav. div.) forming the II. Austro-Hungarian Army under his own command and holding from E. of Zalosce along the upper reach of the Ikwa up to Bereczy; together with the XVIII. Corps (2½ inf. and 1½ cav. divs.), constituting the Austro-Hungarian I. Army (Puhallo), along the lower course of the Ikwa up

to Mlynow; (4) the German groups of armies under Linsingen, to which were assigned the Austro-Hungarian IV. Army (Archduke Joseph Ferdinand) with Szurmay's Corps and the X. and II. Corps (8 inf. divs.), from Mlynow to Kolki on the Styr; Fath's Austro-Hungarian Corps (2½ inf. divs.) on the Styr up to Kolodia, with, to the N. of it, Hauer's Austro-Hungarian Cav. Corps (3 cav. divs. and 3 bdes. Polish legions) and Gronau's German groups (3 inf. divs. and 2 cav. divs.), on the Wiesiolucha–Strumien–Pinsk–lower course of the Jasiolda and Oginski canal. As regards reserves, Linsingen was given the half of the 45th Schützen Div. at Kolki, and the 10th Cav. Div. engaged in constructional work in the line-of-communications area.

Counting by the number of divisions the Russians had only a slight majority in this particular battle area. But their divisions were larger, and in addition they had a considerable number of drafts placed in readiness behind the attacking front, to make good the losses in the regiments as they occurred.

From the methodical pushing forward of the Russian trench system right up to the obstacles of the enemy, it became clear by the end of May that the Russians were proposing to exert their strength especially against the N. wing of Benigni's group at Okna, the XIII. Corps S. of Buczacz, the N. wing of the South Army N.W. of Tarnopol and the IV. Army W. of Olyka. It was accordingly easy for the command on the Austro-Hungarian side to place the reserves behind the parts that were threatened.

In the IV. Army the 13th Schützen Div. was pushed in behind the X. Corps (2nd and 37th Inf. Divs.), posted astride the Olyka–Luck road, and the 11th Inf. Div. behind the Szurmay Corps (7th and 70th Inf. Divs.) S. of that road, so that each of these corps had a brigade from the reserves placed at its disposal.

*The Break-through Battle of Olyka–Luck.*—On June 4, from 4 A.M., the Russians opened battle on the whole section of the front from the Pruth to the Pripet with drum-fire of a violence hitherto unknown in the East. Their artillery systematically battered the enemy's foremost positions and the locality occupied by the higher staff, which was accurately known. The defence system suffered severely, and communication between command and troops was in many cases destroyed. Owing to the dry weather, high whirling clouds of dust and smoke arose, and even on the first day it became an anxious question whether the breaking loose of the enemy's storming columns could be detected in time. At several points the Russians "felt" the enemy first with infantry detachments, but no infantry attack occurred on that day (June 4). In the evening the Russians ceased fire. After a comparatively quiet night, spent by the defenders in making the most essential preparations in the trenches and restoring the badly damaged obstacles, drum-fire was resumed on June 5, with increased violence. During the morning, attacks were launched by the Russian XL. Corps, with the 2nd and 4th Rifle Divs., against the Austro-Hungarian 2nd Inf. Div. to the W. of Olyka, and by the VIII. Corps, with the 14th and 15th Inf. Divs., against the 70th Honved Inf. Division. The blow of the XL. Corps fell upon the men of the Hungarian 82nd Inf. Regt., who, owing to the destruction by drum-fire of all means of observation and communication, were surprised in their dug-outs and either taken prisoners or killed. The fate of the 40th Inf. Regt., to the S. of them, was no better. For with wonderful rapidity the Russians rolled up all the lines of the 2nd Inf. Div. first position, and only fractions of the garrison could escape.

Towards noon the battalions of the Austrian 13th Schützen Div. (25th Schützen Bde.), lying in reserve in the second position, suddenly found the Russians upon them without knowing what had happened to the first-position garrison.

The Russians proceeded systematically to the capture of the second position, in which the battalions of the Viennese 1st and 24th Schützen Regts. were as islands stemming the Russian tide which poured in from all sides. They were too weak to occupy the position completely, and were surrounded and forced back by the Russians after a gallant defence, who advanced through the gaps and communication trenches before the belated 2nd Bde. of the 13th Schützen Div. could come to their aid. By evening the 13th Schützen Div., in a state of great exhaustion, and the scanty remainder of the 2nd Inf. Div. had occupied the third position, which was but weakly organized.

South of the XL. Corps, the VIII. Corps had penetrated the first position, held by the Landsturm of the 70th Honved Inf. Div., and here the battle raged backward and forward. As the 70th Div. was too weak to expel its more powerful enemy unassisted, the 4th Inf. Bde. of the 11th Inf. Div. was sent to be placed under it. But these East Galician regiments, the 89th and 90th, advanced but half-heartedly to the counter-attack against their Russian kindred, and the attack was not pushed home. The 70th Div. was still holding the second line of the first position in the evening, but in consideration of its exposed N. flank, already threatened, it also was withdrawn to the third position in the night of June 5–6. This division, too, had suffered heavy losses, having indeed shrunk to one-third of its fighting strength.

Despite the warning of Generaloberst von Linsingen, the commander of the group of armies, not to put in the reserves too soon in case of an enemy break-through, but only to employ them in a uniform, concentric counter-attack, they were at Olyka thrown into the battle, dispersed, and were therefore unable to make any stand against the Russian onslaught. Carried away in the fatal rush of the retreat, they not only lost their fighting power, but, in effect, did practically nothing towards turning the battle. It was also a calamity that the best troops in the section where the attack was awaiting with certainty, the 82nd Inf. Regt. (5 batts.), should have been placed in front. There they could have no chance of developing their own power of attack, but must necessarily sustain heavy losses, while the less-capable regiments, consisting of Ruthenians of the 11th Inf. Div., held in reserve, broke down in the counter-attack.

On June 6 no special effort was required on the Russian side to overcome the troops of the X. Corps and Szurmay Corps who were mixed up in confusion in the third position. The inner wings of the 37th Honved Inf. Div. and the 7th Inf. Div., which lined the N. and S. corners of the pocket respectively, were sucked into the tide of the retreat. The X. Corps made an attempt at resistance, in an intermediate position W. of Romanow, in the hope of covering the stream of transport flowing back in the direction of Luck, but in vain.

The IV. Army Command now decided to withdraw the Szurmay Corps behind the Ikwa and the Styr, the X. Corps to the bridgehead of Luck, and the II. Corps to a position 6–8 km. E. of the Luck–Kolki road, to insure the protection of the Kivercy railway station. Here 5 German batts. of the Gronau group and half of the Austrian 45th Schützen Div. had already been detrained, and it was proposed to use them for a counter-blow in a southerly direction. Besides these the 29th Inf. Div. from the II. Army, a guard cav. bde. from the German group, and 6 batts. with artillery from Prince Leopold's group of armies were being brought up by train to the IV. Army.

On June 7 the Russian VIII. Corps, reinforced by the 101st Inf. Div., pushed forward against the S. side of the Luck bridgehead, and the XL. Corps against the N. side. The bridgehead was—unknown to the troops—to be defended in the southern section by the 11th Inf. Div. and parts of the 10th Cav. Div., in the northern section by the remnants of the 2nd and 13th Divisions. Towards evening the Russians, advancing from the S.E. and cutting off the southward-facing salient at Krupy, forced their way into the bridgehead, captured part of the 11th Inf. Div., and forced the X. Corps to evacuate it. The counter-attack led by General von Bernhardi, with half the 40th Schützen Div. and the 5 German batts., did not get through. This group now retired at Rozisze to the W. bank of the Styr, and was joined there by the II. Corps. The 7th Inf. Div. was handed over to the I. Army for convenience of supply.

In the morning of June 8 the Russians were able again, without appreciable effort, to force the broken-down troops of the X. Corps to relinquish the W. bank of the Styr. The Russians then swept on in broad masses over the fourth, and—so far as the IV. Army was concerned—last line of defence.

The X. Corps retired with the 37th and 13th Divs. behind the Sierna, while the 2nd Inf. Div. and 10th Cav. Div. to the E. and

S.E. of Torczyn established communication with the Szurmay Corps standing on the S. bank of the Polanka, facing north. But this corps, threatened by the Russian attempts to break through, was obliged to wheel back on June 9 behind the Leniewka line, between Korszew and Czarakow, and the bent-back N. wing of the I. Army could only be extended as far as Lawrow. There were no longer sufficient forces for the widening curve. A dangerous gap yawned between the I. and IV. Armies.

Meanwhile the Russians had also continued their attacks against all the armies farther to the south. The S. wing of the I. Army near Sapanok had, thanks to the arrival of the 25th Inf. Div., been able to ward off a Russian assault; and the I. and South Armies also repelled all attacks, the South Army being able even to send a brigade of its reserves to the N. wing of the VII. Army. But in the case of Pflanzer-Baltin's Army the Russians gained some important success on June 7 at Jazlowiec, where the Russian II. Corps of Shcherbachev's Army succeeded by dint of continuous assaults in breaking through the XIII. Corps and forcing it back behind the Strypa. On June 8 even this position became untenable, and the corps had to retire behind the Buczacz-Karopiec line before it could stabilize itself; and on June 9, Buczacz and the Strypa line as far as Bobulince were lost by the VI. Corps, which had now also begun to waver. On the S. wing of Bothmer's Army, both then and after, all the Russian assaults broke down. In the area between the Dniester and the Pruth, Letchitsky directed his efforts principally against Benigni's group on the N. wing, which, though it was able for the moment to ward off a Russian assault at Okna, had to sacrifice the positions on the N. bank of the Dniester to the necessity of forming reserves. The situation of the defenders here was undoubtedly very tense. All the available reserves (4 regts. of 3 divs.) had been given to the XIII. Corps; in Benigni's group there were troops from 8 different divs., already inextricably mixed. In sum, this section of the front was no longer in a condition to withstand a powerful push.

The allied Higher Commands were now confronted with the problem of finding measures to restore the equilibrium of the eastern front, which had been so rudely and abruptly disturbed. On the western front violent battles were raging, and in the Italian theatre all forces were engaged. Yet it seemed inadvisable to consider seriously the idea of leaving the eastern front to its fate, without sending new forces; for the distress already felt by the Central Powers forbade the abandonment of so much territory, with all its grain and other products, and the industries started and re-started in it. It was necessary, besides, for the Central Powers to avoid as far as possible any defeat in Galicia and the Bukovina, lest their neighbour Rumania, once more in a state of indecision, should deem it advisable to join the Entente; and, finally, the German front N. of Polyesie, still faced by numerically superior Russian forces, had to be considered. In short, it was essential immediately to improve the situation. The two Higher Commands therefore decided to proceed at once to a counter-offensive in Volhynia. This was to take the form of an assault on both sides of the Kowel–Rowno railway by a group consisting of 7½ divisions. Until this attack-group should have been formed, decisive battle was to be avoided. If pressed by the enemy, the Szurmay Corps, X. Corps, the Bernhardi group and the II. Corps were to fall back in a north-westerly direction—if necessary as far as the Stochod.

*Battles on the Styr.*—Brussilov made his troops follow up into the bend W. of Luck with great caution, fortifying each section as it was taken. He directed his energies towards breaking through the Styr front, as yet intact, thus widening the breach towards the north. After several vain attempts at crossing on the fronts of Fath's Corps and Hauer's Cav. Corps, the Russian XXX. Corps finally succeeded, on June 9, in setting foot on the N. bank of the Styr E. of Kolki. But a counter-attack by the 4th Inf. Div. threw the Russians back to the S. bank and cost them 1,500 prisoners. Another later attempt by the Russians to cross at Sokul on June 12 ended likewise in failure.

On the S. wing of Linsingen's group of armies, preparations for the proposed counter-attack were meanwhile going forward systematically, without any serious interruption from the Russians. The IV. Army (10th Cav. Div., the Szurmay Corps and X. Corps), now commanded by Generaloberst von Tersztyánszky, was shifted to the line Biskupiczy–Chorostow–Siviniarin, to make room for the attack-group (108th Inf. Div., Rusche's combined German Inf. Div., and the German X. Corps consisting of the 19th and 20th Inf. Divs.), under the experienced command of General von der Marwitz, which was deploying in the area Siviniarin–Ozierany.

The Russians also carried out a series of violent attacks against the Stochod and Styr section between the Kowel–Rowno railway and Kolki, but here again the attacks were repulsed with heavy losses except for a passing local success at Kolki.

The result of shifting the IV. Army to the N.W. and forcing back the I. Army, whose N. wing had reached Molatyngorni on the Lipa, was to extend the gap between the two armies by 50 km. Owing to the shortage of fighting troops this gap could, for the moment, only be kept under observation by line-of-communication troops. Had the Russians had more troops, in particular cavalry, or, still more important, sufficient enterprise, this could have been an opportunity for undreamed-of successes. But Kaledin obstinately persisted in his attacks on the Styr front, thereby allowing the allies to close the yawning gap, for the time being, with cavalry. This was achieved by hastily bringing up the Ostermuth Cav. Corps (4th and 7th Cav. Divs. and 1st Landsturm Hussar Bde.) to the area round Gorochow, in addition to the 10th Cav. Div. and a German cav. bde., which were placed in front of the IV. Army to hide its movements. Finally the 61st Inf. Div., which was on its way by train from the Tirol to the VII. Army, was detrained at Stojanów behind the left wing of the I. Army and placed under its command.

It was not until June 14 that the Russians brought forward great cavalry masses against the area between the I. and IV. Armies. As a result, violent battles were fought, first at Lokaczy against the 10th Cav. Div. and, after Ostermuth's Cav. Corps had hurried up to assist that division, against the 4th and 7th Cav. Divs. at Swiniuchy; and the Russians were forced to realize that the gap between the two armies was now closed.

*The Break-through at Okna.*—At the same time, events in the Bukovina and Eastern Galicia had taken a most unfavourable turn for the allies. After many vain attacks on the Bukovina front, Letchitsky eventually succeeded in breaking through Benigni's Corps on June 10 to the W. of Okna by means of a powerful push between Dobronoutz and Doroschoutz. Although the right portion held its ground, the left was driven back in spite of all the reserves that were put in, and this whole section of the front had to be taken back to the line Dobronoutz–Zastawna. A renewed attack delivered by the Russians, forty deep, on Zastawna, undermined the corps' power of resistance to such a degree that the XI. Corps, immediately to the S. of it, had to be withdrawn behind the Pruth during the following night, while Benigni (who could only with difficulty prevent his corps from being driven away southward) and the Hadfy group tried to take up a position again 12–15 km. to the W. of the original front. The Russians, who at first pursued hotly, forced General Pflanzer-Baltin, whose vigorous leadership was nullified in these critical days by illness, to put back the Bukovina front to a line running from Bojan (on the Rumanian frontier) up the Pruth to Zablotow, then bending northward through Gwozdziec–Obertyn–Nieswiska. This line was reached on June 14 by the Austro-Hungarian troops, who were now being but little molested; as the VI. and XIII. Corps had been placed under the South Army, General Pflanzer-Baltin's command area became limited to the troops S. of the Dniester.

These battles in Bukovina and Eastern Galicia, of which the outcome was so unfortunate for the Austro-Hungarian troops, were of very great importance, not only on account of the grievous sacrifice of ground, prisoners and war material, but also because of their repercussion on the attitude of Rumania. The continuous violent attacks by the Russian VII. Army against the two weakened and confused VI. and XIII. Corps on the South Army's right wing offered no prospect whatever of a stabilization of the

fighting front, and the Army Higher Command was therefore compelled to dispatch the two divisions (German 105th from Macedonia and Austro-Hungarian 48th from the Isonzo) originally intended for Marwitz's attack-group to back up the S. wing of Bothmer's Army.

*Counter-Attacks on Luck.*—As a result of the diversion of these two divisions the allies had no longer forces enough to carry out the flank blow planned on the right of the Kowel–Luck road. It was therefore decided to deliver a concentric attack in the general direction of Luck. The following were to take part:—the N. wing of the I. Army (now also brought under Linsingen's command), with the 7th and 61st Inf. Divs. and Ostermuth's (later Leonhardi's) Cav. Corps, advancing from the Lipa brook to the N.E.; the IV. Army in an easterly direction; Marwitz's group (German X. Corps, German 108th Inf. Div., and Austro-Hungarian 29th Inf. Div.), and Bernhardi's Corps with the combined infantry division Rusche and half of the 45th Schützen Div., in a south-easterly direction; and the II. Corps on both sides of the Styr. This broadly conceived attack was to begin on June 16.

On June 15 the I. Army suffered another reverse. The N. wing of the Russian XI. Army (XXXII. Corps) drove back the 25th and parts of the 46th Div. at Rudnia on the Brody–Dubno railway. As there were no forces available for a counter-attack the N. wing of the Austro-Hungarian II. Army (Kosak's Corps) and the S. wing of the I. Army (XVIII. Corps) had to be withdrawn generally to the frontier between Lopuszno–Radzievilow–Beresteczko.

The offensive against Luck, on which the allies had set all their hopes, did not go well. The I. Army's N. wing had indeed succeeded in reaching the N. bank of the Lipa and pushing on to Swiniuchy on June 16–17; the sparsely filled-up divisions of the IV. Army had pushed forward to the E. of Lokaczy and Wojmica; and Marwitz's group had gained ground W. of Kisielin, in spite of fierce Russian opposition. But Bernhardi was forced back to the N. bank of the Stochod by heavy counter-attacks, and, when the Russians again began to press the I. Army's S. wing, the I. Army Command had no choice but to fetch back the 7th Inf. Div. (which had just succeeded in crossing the Lipa) to the S. bank, and place it behind the threatened 46th Division. As regards the II. Corps, there could be no question of crossing the Styr, and it was obliged—like Fath's Corps—to devote its whole strength to warding off the continuous attempts of the Russians to cross at Gruziatyn and Kolki.

Only on June 21 did Linsingen's group of armies resume the attack, after a new attack-group had been formed on its right wing under General von Falkenhayn. This group consisted of the 61st Inf. Div., Leonhardi's Cav. Corps, the newly arrived German 43rd Res. Div., and the Austro-Hungarian 48th Inf. Div. brought by train from the South Army. The N. wing had also to be reinforced by the 11th Bavarian Inf. Div. on account of the arrival of fresh Russian forces. Falkenhayn's blow gained ground up to the line Zwiniacze–Bubnowa, whereupon the Russians fell back also in front of the IV. Army, so that the latter was able to follow up to the Sadowa height. Marwitz broke through three positions by means of vigorous attacks, though constantly checked by Russian counter-assaults, but found himself confronted, just W. of Zaturcy, with a new Russian line of resistance. Meanwhile Bernhardi had difficulty, in spite of the Bavarian reinforcements, in withstanding the powerful mass-attacks which the Russians repeatedly delivered against the neck of land between the Styr and the Stochod at Sokul.

But although the counter-offensive of Linsingen's group of armies had up till then met with undeniable success, the fruits of which—apart from the ground gained—were 12,000 prisoners, 2 guns and 54 machine-guns, Luck, the objective, was still far from being attained, owing to the growing strength of the Russian resistance which was fed by drafts that were actually taken in part from the front N. of Polyesie.

In the meantime the Russian XXII. and XVI. Corps of [illegible]bachev's Army continued their costly attacks against the South Army, in order to shake the southern hinge of the hitherto unchanged Strypa front at Wisniowczyk. Their temporary successes over the 39th Honved Inf. Div. were invariably neutralized by counter-attacks from the Oppeln group, consisting of Austro-Hungarian and German regiments, until finally the Russians after June 21 gave up their fruitless efforts. Equally bold was the stand made by Maj.-Gen. Leide's little group on the South Army's S. wing, which warded off several attempts by the Russians to cross the Dniester N.E. of Olesza.

*The Loss of Bukovina.*—Pflanzer-Baltin in Bukovina, on the other hand, had met with fresh misfortune. After the bridgehead on the N. bank of the Pruth at Czernowitz had been levelled by Russian artillery-fire on June 16, and its garrison had retired, strong Russian forces of the XI. Corps crossed the Pruth both above and below the town, whereupon General Korda, commander of the Austro-Hungarian XI. Corps, considered it necessary to order the evacuation of Czernowitz and the S. bank of the Pruth. He led his corps behind the Sereth, and Brudermann's Cav. Corps (3rd and 8th Cav. Divs.) had also to retreat.

On June 19th Korda and Brudermann were again attacked by the Russian XI. and XII. Corps and III. Cav. Corps, and forced to relinquish the Sereth line. Korda was now to retire on the line Gwrahumora–Oberwikow–Lukawetz and to hold the defiles by groups, while Brudermann in the Czermos valley was to safeguard the right flank of Benigni's group, in front of which the Russians had so far remained quiet.

In the S. of Bukovina the Russians pursued only with the III. Cav. Corps, reinforced by one infantry division. Nevertheless, Korda's troops, extended over so wide an area, could not hold the proposed line for fear of being outflanked. Papp's group fell back in sections to the often-contested position N.E. of Jakobeny, and, reinforced by the 79th Honved Bde., occupied it on June 24, while the 202nd Inf. Bde. and the 80th Honved Bde.—entirely unmolested by the enemy—reached Moldawa for the purpose of blocking the route leading to Kirlibaba. Meanwhile Brudermann's Cav. Corps and, N. of it, Habermann's group (parts of the 24th and 30th Inf. Divs.), against which the Russian XI. and XII. Corps had now turned, had to sustain severe fighting at and N. of Kuty. Evidently Letchitsky was preparing the next blow on Kolomea.

*Continuation of the Counter-Attack on Luck.*—In the meantime the allies persisted in their intention to force a change in the situation at Luck—this time by increasing the pressure on the S. flank of the bridge formed by the Russian VIII. Army, which had made over the section N. of Kulikowice (in the bend of the Styr) to the III. Army (Lyesh). General von der Marwitz, giving up his own command to General von Lüneburg, now took over, on the S. wing of Linsingen's group of armies, the main attack-group, consisting of the 7th Inf. Div., recently brought to the Lipa, the newly arrived German 22nd Inf. Div., the 108th Inf. Div. brought up from the former Marwitz group, and Falkenhayn's Corps (Austrian 4th and 7th Cav. Divs. and 48th and 61st Inf. Divs., German 43rd Res. Div. and 9th Cav. Div.). After the heavy artillery, needed for the forcing of the powerful Russian position at Bludow, had come up, the attack began on June 29. The IV. Army with a strong N. wing, the Lüneburg group and Bernhardi's Corps, were to join in, the last-named having stormed several Russian positions at Sokul since June 24.

The attack brought encouraging initial results to all groups engaged. Bernhardi followed up his successes at Sokul, and was also able to force the Russians to evacuate the bridgehead lying on both sides of the railway on the N. bank of the Stochod. Lüneburg advanced his line 2–3 km., and the Austro-Hungarian X. Corps stormed the often-contested position of Zatwicy. The greatest success was, however, won by Marwitz, who, on July 1, undeterred by the rainy weather which hampered both the artillery fire and the mobility of the troops, penetrated the enemy position between Boremel and Ugrinow on a front 20 km. wide and 5 km. deep, and was able to hold his ground in spite of violent counter-attacks, some of which were delivered by cavalry. But Bludow could not be captured and the IV. Army was accordingly extended southward while the three divisions standing before Bludow were sent to reinforce the main attack-group to the E. of it. In spite of this, no further success was achieved in the attack.

The Russian resistance, which manifested itself in violent counter-blows, was not to be overcome. Farther N., too, neither the Lüneburg group, which had been forced to give up a brigade to Woyrsch's army group (attacked by superior numbers at Baranovichi), nor Bernhardi's Corps (which had sent the 11th Bavarian Inf. Div. from Sokul to the seriously menaced position in the Styr salient) could make any further progress.

*Loss of the Styr Bend.*—The increasing exhaustion of the troops of the II. Corps and Fath's Corps in the Styr bend, due to incessant fighting, was not lost upon the Russians, and Brussilov turned his attention more and more to the wing of the Russian VIII. and III. Armies. On the S. flank of the Styr bend, the I. Turkestan and V. Cav. Corps were brought up to join the XXX. Corps in the attack, while the Russian XLVI. Corps, with 4½ inf. and 2 cav. divs., pressed against the N. flank. The Russians won the first success on July 4 at Kopyli, when they established themselves on the N. bank, and were not to be driven away even by the 11th Bavarian Inf. Div. which was hurriedly brought up. On July 5, at Kolki, the 2nd Polish Bde. and half of the 45th Schützen Div. had also to yield ground; and as on the same day Fath's left wing and the 1st and 3rd Polish Bdes. posted at Kolodia on Hauer's S. wing were broken through in spite of a brave defence, the risk of Fath's doubly outflanked corps being cut off could now only be averted by ordering his seriously exhausted troops back to behind the Stochod. Hauer's Cav. Corps, whose position had now become untenable owing to its exposed S. flank, had also to retire behind the Stochod, whereby the 11th Honved Cav. Div. on its flank was involved in further fighting which cost it heavy losses. To strengthen the new Stochod front the 37th Inf. Bde., which had been sent northward by train, to join Woyrsch, was now diverted to Fath's Corps, while in the new area of Hauer's Cav. Corps the German 9th Cav. Div. from Marwitz's group, the Bavarian Cav. Div. sent up by train from Hindenburg's group, and the combined Clausius Div., were assembled. Fath's Corps was placed under General Bernhardi, to assure unity of command. In connexion with these events, the centre and right wing of Bernhardi's Corps from Sokul, and the S. wing of the Gronau group (82nd Res. Div.) from the Wiesiloncha, had to be withdrawn behind the Stochod. The Russians pursued hotly, and tried to push across the Stochod, attacking at different points up to the middle of July, but were everywhere, in some cases after the defence had put in its now adequate reserves, repulsed with bloody losses.

In view of the changed situation and the shifting of forces that had become essential, a renewal of Linsingen's offensive could no longer be considered. His troops received orders to establish themselves in a permanent position on the line reached.

At the end of June the Austro-Hungarian Supreme Command saw itself forced to close down the offensive against Italy, and shorten the front on the Sette Communi plateau, in order to release troops for the difficult fighting on the eastern front. The first forces available (the VIII. Corps staff with the 45th Schützen Div. and 59th Inf. Div.) were dispatched at once by train to Pflanzer-Baltin's Army which was now, at the turn of the month, once more the focus of the fighting.

*Battle of Kolomea.*—After the Russian XI. Corps, in the fighting at Kuty and Wiznitz, had pushed back Habermann's group to the heights W. of Kuty, Letchitsky massed his XII. and XLI. Corps astride the Pruth, and advanced against Benigni's weak divisions on June 28. On the N. wing the attack was repulsed with the aid of reserves, but in the centre and on the S. wing the Russians broke through, and Benigni's troops had to retire to the bridgehead at Kolomea and behind the Pistyanka. To conform to this, Pflanzer-Baltin brought back also those parts of his army that were farther north.

On June 29 the Russians renewed the attack with the XI. Corps against Benigni's S. wing at Pistyn, and forced it back westwards. The course that the battle was taking, and the danger of Brudermann's Cav. Corps, farther to the S., being driven southward, led the Austrian Supreme Command to order the withdrawal of the army to the prepared position Berenzow–Sadzowka–Ottynia. Brudermann's Cav. Corps, with its right still echeloned forward for the time being, held its ground until July 1, when new attacks drove it to retire to the line Kosmacz–Zabie. Kolomea was thus given up by the Austro-Hungarian troops. Maj.-Gen. Leide's group, belonging to the South Army, which on the S. bank had been maintaining the liaison with the VII. Army, had meanwhile had to ward off mounted attacks by the 6th Don Cossack Div. on June 29. On June 30 this division again attacked on both sides of the Olesza–Tlumacz road, with a mass 6 lines deep and 3 km. wide, but once more the attack spent itself in vain, suffering exceptionally heavy losses, and providing yet another example of the uselessness of this type of cavalry attack on infantry, under modern conditions. Meanwhile reinforcements had come up from the Italian theatre, and were detrained at Nadworna and Delatyn. The 119th Inf. Div. was sent by the German Command to Tysmienica for the VII. Army.

Pflanzer-Baltin now intended, in conjunction with the South Army, to give the movement of battle a new character by attacks directed from the N. and S. wings of his Galician front. From the area S. of Delatyn the 44th Schützen Div., reinforced by a regiment of the German 105th Inf. Div., attacked north-westward, covered on its E. flank by Habermann's group; and from the area E. of Tlumacz, General Kraewell's group (German 119th and main body 105th Inf. Div., Maj.-Gen. Leide's group and 10 companies of the XIII. Corps) pushed southward. Both attacks met with success on July 2 and 3. In particular, Kraewell's group, to which Hadfy's group attached itself, gained ground up to the line running from the Dniester bend at Piotrow to Chocimierz and Molodylow, after once more repelling Russian cavalry attacks. But Brussilov had already taken his counter-measures. While the Russian IX. Army sent forward its powerful cavalry against Brudermann's N. wing, pressing him back to Tatarow at the northern exit of the Jablonica (Tartaren) Pass, Shcherbachev attacked the XIII. Corps of the South Army at Barysz and pushed it in. After some temporary successes in counter-attack by the reserves, the corps had to be taken back to the Koropiec brook in consequence of renewed Russian attacks. Violent attacks were also made on Benigni's group, N. of Sadzawka, Leide's group on the Dniester and the VI. Corps E. of Monasterzyska. But whereas Benigni, by the aid of 11 batts. of his own reserves, and the VI. Corps, with parts of the German 1st Res. Div. which had just reached the South Army, was able to restore the situation, Kraewell's attack had to close down on account of the successes obtained by the Russians against Leide's group. All attempts to drive the Russians out of the region of the Jablonica Pass failed.

A brief offensive movement by the Austro-Hungarian XI. Corps from the S. corner of Bukovina did in fact gain ground up to Moldawa, but it had to be cut short and the troops withdrawn to their starting-point as soon as the object of drawing down the enemy's forces upon them was attained; and a brigade had had to be given up to guard the threatened Jablonica Pass.

If, however, the numerous counter-offensive actions which arose out of Pflanzer-Baltin's initiative were insufficient to bring about a change in the situation of his army, they had at least had the effect of forcing Letchitsky to remain passive for the moment between the Dniester and the Pruth, in order to give his exhausted troops a respite after the heavy losses they had suffered in consequence of his ruthless mass-attacks. The Russians opposing Linsingen's group of armies, on the contrary, displayed much activity after the middle of July; and, moreover, by their repeated advances against the Carpathian front between the Jablonica and Prislop Passes they obliged the allies to give closer attention to this part of the front, not so much on account of the strategical importance of these operations, as in consideration of public opinion in Hungary, and of the extent to which a fresh misfortune in this quarter might be expected to react upon Rumania's attitude.

*Organization of Command.*—The command of the front from the Jablonica Pass to the Rumanian frontier was accordingly given to General von Pflanzer-Baltin on account of his long experience in the minor operations in this mountainous country; and on the N. of the Carpathian front a reorganization of the

command was to take place. The German Command, which since the beginning of June had sent 16 divs. and numerous higher staffs to the support of the front S. of the Pripet, urgently demanded an increased influence on the conduct of operations on that front, controlled by the Austro-Hungarian Supreme Command. Already German troops were fighting on all parts of the front, except with the II. Army; and German groups and corps commands were now systematically pushed in where German troops were placed, the intermediate and adjacent Austro-Hungarian formations being put under their command. It is undeniable that, by interspersing German troops and commands in this manner on the Austrian eastern front, which was at that time badly battered, no mean increase in the power of resistance was obtained. But these measures also produced an increase of the influence which the German General Staff arrogated to itself in the conduct of the war.

In order to bring about a fundamental improvement in the position S. of the Dniester, which was going from bad to worse, the two Supreme Commands proposed to deliver a counter-attack on a grand scale on both sides of the river in a south-easterly direction. For this purpose a new army—the Austro-Hungarian XII.—was to be formed from the troops of the inner wings of the VII. and South Armies and the new divisions now being brought up by train. It was to be under the command of the Archduke Karl Franz Josef to whom General von Seecket was appointed chief-of-staff. But since the incoming troops had always to be thrown into the battle as soon as they detrained, the formation of this army never took effect. On the other hand, the section of the former VII. Army lying between the Jablonica Pass and the Dniester was handed over, as the "III. Army," to the III. Army Command (Generaloberst von Kövess), which was on the way by train from Tirol. Archduke Karl was made commander of an "Army Front" consisting of the VII., III. and South Armies. This new distribution came into effect on July 20. Another result of the agreement reached by the two general staffs was the appointment of Gen. Field-Marshal von Hindenburg to the supreme command of all the remainder of the eastern front, *i.e.* from Riga up to and inclusive of the II. Austro-Hungarian Army. He took over the command on Aug. 30, with Brest Litovsk as headquarters. The German Command decided further to give the 2nd Jäger Bde., now brought up to divisional strength and known as the "Carpathian Corps" (later as the 200th Inf. Div.), to the VII. Army, so as to enable this army to take the offensive, believing that the anticipated success would in the end dissuade Rumania from abandoning her neutrality. The Austro-Hungarian Higher Command on the other hand transferred the Austro-Hungarian 61st Inf. Div. (worn out as it was) from Marwitz's group, and the 11th Honved Cav. Div. from Hauer's Cav. Corps, to northern Transylvania, since, from reliable information received, it appeared that Rumania's intervention on the side of the Entente would have to be reckoned with before August was out.

*Battles at Monasterzyska and in the Carpathians.*—In the meantime Brussilov had persisted in his mass attacks, regardless of enormous losses. Undeterred by the reverse suffered on July 7, Shcherbachev again attacked the inner wings of the XIII. and VI. Corps between the Koropiec brook and the Strypa with his II. and XVI. Corps, on July 12–13. He succeeded on the two days in breaking through the Austro-Hungarian 12th Inf. Div. and German 1st Res. Div. in turn, but the two divisions, each supporting the other with its own reserves, succeeded in ejecting the Russians from their positions again. Against emergencies, however, the main body of the German 105th Inf. Div. was transferred from the area S. of the Dniester to the South Army.

The Russians now brought up fresh forces (11th and 82nd Inf. Divs.) to the Carpathian front, and by dogged mountain fighting forced the 8th Cav. Div.—which had to give up the commanding Chomiak height—back on to the wall of the Jablonica Pass, and defeated the 3rd Cav. Div. in the battle of the Ludowa massif, driving it back also to the frontier heights. About the headwaters of the White Czeremosz, Russian detachments had already advanced over the crest line in the direction of the Visso valley, but were stopped in front of Borsa by the newly arrived 34th Inf. Div. which with one of its brigades pushed the Russians back on to the N. slope of the mountains, while the other brigade relieved the exhausted 8th Cav. Div. at the Jablonica Pass. Farther E. the Russians strove to wrest the pass at Kilibaba, which commanded the Caput height, from the left wing of the XI. Corps, but without success.

*Battles on the Lipa and at Beresteczko.*—The first attacks executed by von der Marwitz's group on July 10 and 11, which were designed to screen the shifting of troops to the Stochod front, attracted the attention of the XI. Russian Army (Sakharov). This army had been comparatively inactive since the middle of June, and was now selected by Brussilov to deliver fresh blows against the centre of the battle-front.

In the night of July 15–16 a powerful assault by the V. Siberian Corps and the VIII. Corps threw back the centre of Marwitz's group to Zwiniacze. Since a counter-attack made by 9 German battalions failed to restore the situation, Marwitz was obliged to bring back his far-advanced right wing behind the Lipa also. For the same reason the bridgehead at Werben, on the E. bank of the Styr, which was still held, had to be evacuated, for though all attacks against it on July 16 were repulsed, no operation E. of the Styr could be contemplated in view of the general situation. As Marwitz considered his right wing, now behind the Lipa and the Styr, to be adequately secured, he shifted two divisions—the 22nd and 43rd Inf. Divs.—which seemed to him not there indispensable, to his left wing at Gorochow, where he feared the Russians would launch fresh attacks.

The Russians now extended the violent artillery fire which they had maintained against Marwitz's group for some days as far as to the S.E. of Beresteczko. On July 18 they undertook a demonstrative attack against the 25th Austro-Hungarian Div. N. of Brody, and on July 20, after crossing the Styr at Werben, directed a powerful blow by their XXXII. Corps S. of the Lipa against the 46th and 7th Divs. This blow so strongly affected these divisions that, in spite of a counter-attack undertaken by 6 batts. of the army reserve, they were unable to hold their ground on the new line Beresteczko–Smolaiva, as was intended by the Army Command. The whole front of the I. Army had to be withdrawn to the line Beresteczko–Leszniow–Siestratyn. But Marwitz had again to surrender his reserves—the 48th Austro-Hungarian Div. and 3 batts. each of the German 22nd and 43rd Res. Divs.—to the I. Army in the area S. of the Lipa. The II. Army also transferred half of the 33rd Austro-Hungarian Div. to Radziechow behind Puhallo's Army. This part of the front was now thought to have sufficient support, and it was hoped that there would be quiet for a time.

*Battle of Brody.*—Brussilov, however, continued his assaults against the centre of the allied front opposite him without intermittance. His immediate objective was Brody. On July 24th the Russian XXXII. Corps, which had been shifted to the S., attacked the 25th Austro-Hungarian Div. at Leszniow, and pressed it back several kilometres, together with the adjacent 33rd Austro-Hungarian Div. N. of it. In the following night the Russian XVI. Corps, next in line to the XXXII. Corps on the S., attacked the N. wing of the II. Army and forced it back to a prepared position on the frontier of the Dual Monarchy.

To ensure unity of command in the Brody area, the Austro-Hungarian XVIII. Corps was placed under the II. Army Command, but the troops of the I. Army standing W. of the Styr were put under the command of Linsingen's group of armies, as Lt.-Gen. von Dieffenbach's group, and the I. Army Command was dissolved. The Austrian 106th Landsturm Inf. Div. arrived in the Brody area from the Italian theatre of war, while the German 10th Landwehr Div. was coming up by train by way of Lemberg, the latter, however, being short of one regiment left in the zone of the IV. Army, where comprehensive Russian attack preparations had been discerned.

On July 26 Sakharov renewed his violent attacks between the Styr and Radziwilow with directions towards Brody. Difficult and changeful fighting ensued, in which portions of the 106th Landsturm Inf. Div., just detrained, took part with success:

On July 27 the battle still raged with undiminished fury. Up to 4 P.M. all the Russian assaults had been repulsed, but a new massed blow, delivered by the V. Siberian Corps to the E. of the Leszniow–Brody road, proved decisive. Brody had to be relinquished, and positions occupied immediately S. and N. of it. Then, as it seemed impossible without appreciable reinforcements to hold the new positions, the 10th Landwehr Div., intended for the II. Army, having been diverted en route to Linsingen's group, the troops of the II. Army were withdrawn to a prepared position behind the ponds of the upper reaches of the Sereth and the Styr, on the line Zalosce–Jasionow–Boldury. This line was occupied during the night of July 28–29 without serious molestation.

During the battle of Brody the Russians had also delivered mass-assaults N. of the Pripet at Baranovichi and Gorodishche but they were repulsed with very heavy losses. Immediately afterward, on July 28, a fresh Russian attack on a large scale was launched against the front S. of the Pripet, and particularly against the III. and South Armies, parts of the IV. Army and the Stochod front. The allies, still condemned to play the thankless rôle of defenders, were in a most difficult position. With their few available reserves they could send fresh forces only to the most sorely pressed parts of the front, while at the remaining points, which could no longer be held, salvation could be sought only in shaking off the enemy without—so far as could be seen—any hope of winning back the lost positions.

*Battle of Kovel.*—In his scheme for the general attack launched in the end of July, Brussilov had selected Kovel as the objective for the N. wing of his group of armies, and to this end had brought up the 23rd Inf. Div. and 8th Cav. Div. as far as Tobol, N. of the Lipa. To facilitate the transmission of orders the N. wing of the VIII. Army—to which had been added the I. and II. Guard Corps and the Guard Cav. Corps—was formed into a separate group under General Bezobrazov.

On the morning of July 28 Szurmay's Corps of the IV. Army, after being heavily bombarded with gas-shell, were attacked by the Russian XL. and VIII. Corps at Sadowa and thrown back on Szelwow, where a part of the artillery, after holding out until the last, was sacrificed to the pursuing Cossacks and Circassians. But the Russian cavalry, wheeling S., was held up by some intervening reserves, and in the counter-attack some of the lost ground was regained.

At the same time the N. wing of the VIII. Army (XXIII. and XXXIX. Corps) and Bezobrazow's Guard attacked the reinforced Lüneburg Corps, standing E. of the Stochod, and forced it, in spite of the intervention of the 121st Inf. Div., to retire behind the Stochod. The attacks launched on the same day by the S. wing of the Russian III. Army against Bernhardi's group and Hauer's Cav. Corps at several crossing-places on the middle Stochod broke down with unusually heavy losses to the Russians. The next day the Russians repeated their costly attacks with equal vehemence, but were everywhere repulsed. Only at Kaszowka did a successful break-through force the II. Corps to retire from their pronounced salient in the Styr bend to a shorter line running farther W. and long since prepared. Unencouraging, too, were the Russian assaults against Linsingen's group of armies, the most hotly contested points being Szelwow, Kisielin and the railway crossing on the Stochod. But their efforts were all in vain. At Stobychowa, again, the Russians, after a hard struggle, succeeded in establishing themselves on the W. bank, but were thrown back to the E. bank after several days of counter-attacks. Thus Brussilov, in spite of his tremendous output of force, failed to reach his objective, Kovel.

*Battle of Tlumacz.*—From July 28 onward the attacks directed against the South Army N.W. of Buczacz were all completely repulsed; but Bothmer's Army, as the result partly of the constant bending-back and extension of its own S. wing, and partly of the retreat of the II. Army N. of it, became exposed to envelopment on both sides, and its position was soon untenable.

Letchitsky directed his attacks, renewed likewise on July 28, against the sector immediately S. of the Dniester, and drove in Kraewell's group with the first assault. This group, after vainly putting in its reserves, had to fall back—carrying with it Hadfy's N. wing—to the line from Molodylow along the eastern edge of Tlumacz to the Dniester loop S.W. of Koropiec. On Aug. 7 Letchitsky repeated his assaults against the Kraewell group and pushed it back, inflicting heavy losses, through Tlumacz towards the west. The Kraewell and Hadfy groups, and the adjacent I. Corps on the S., were now reëstablished several kilometres away from the enemy, while the VIII. Corps (Benigni's) repulsed all Russian attacks. But when, on Aug. 10, yet another of Letchitsky's mass assaults fell on the Kraewell group, the III. Army could no longer hold its ground; after giving up Stanislau, it had to be withdrawn to the line Zielona–Nadworna–Bohorodczany–heights W. of Stanislau–Jezupol.

Thus another way into Hungary—that over the Pantyr Pass—now lay exposed to Russian attacks, for it was only possible temporarily to block it by a weak detachment. Conforming to this retreat of the III. Army the right wing of the South Army had again been bent back, having been fiercely attacked by the Russians at Monasterzyska. Farther in the N., that part of the front of the South Army which still projected E. of the Strypa was also taken back.

*Battles at Zalozce and on the Zlota Lipa.*—In the beginning of August there was also fierce fighting in progress on the II. Army's front at Zalozce, in the course of which Lt.-Gen. Eben's newly formed German Corps (195th and 197th Inf. Divs.) came to the assistance of the Austro-Hungarian V. Corps, hard pressed by the Russian VII. and XVII. Corps. Although the Russian break-through was stopped, the counter-attack was not able to win back the former positions completely, and it was suspended on Aug. 10.

In spite of all previous failures, the Russian Guard to the N. of the Kovel–Rovno railway, and, N. again of the Guard up to Stobychwa, the I. Turkestan and I. Siberian Corps, driven on with ferocious energy, persisted in their attacks against the Stochod line. Extraordinarily heavy losses, no longer to be replaced from those great reservoirs of men that had hitherto seemed inexhaustible, forced Brussilov after Aug. 10 to suspend the attacks on Kovel.

This relieved the difficulties of the now unavoidable withdrawal of the South Army, which with its N. wing was still holding the last section of the original front line on the Strypa between Wisniowczyk and Kozlow. On the evening of Aug. 11 it began a two-night movement of retreat, which was to take it to the line Horozanka–Zawalów–heights E. of Brzezany–Koniuchy–Zborow. Conforming to this movement, Eben's Corps, forming the S. wing of the II. Army, swung back. The retreat was not accomplished without several sharp rearguard actions, but the pursuing Russians could not prevent the retreating army from duly occupying the new position that had been chosen. The Turkish XV. Corps, intended for the Linsingen group of armies but now no longer needed in view of the improved situation there, was sent to the South Army, and intervened with its 19th Div. on Aug. 13th at Brzezany with success. The attacks led by the Russians against the South Army's S. wing on the two following days ended in failure.

With Kövess's Army a comparatively peaceful interval had set in, and, in consequence, the 51st Honved Inf. Div. was able to go to Transylvania, where from day to day an inroad by the Rumanians was expected, while the 44th Schützen Div. was handed over to the Isonzo front. To replace these the German XXIV. Res. Corps with 2½ inf. divs. was sent to the III. Army, the German commander, General von Gerok, taking over the command of the III. Army's N. wing from General Kraewell.

*The Counter-Offensive in the Wooded Carpathians.*—On the S. wing of Archduke Karl's Army front the allies had so many troops available in the beginning of Aug. that they were able at last to proceed to a counter-offensive. Lt.-Gen. Conta was to attack from the centre of the VII. Army with the Carpathian Corps and the 68th Inf. Bde. in the Czeremos valley. The two neighbouring groups were to join in with this attack; Field-Marshal-Lt. Rudolf Krauss (67th and 202nd Inf. Bdes. and 8th Cav. Div.) from the Jablonica Pass into the Pruth valley; and the 40th Honved Inf. Div., which was later placed under the

command of Conta, from Kirlibaba toward the N. into the Suczawa valley. In this operation, which did not follow the old army road Jakobeny–Gurahumora, but took the main forces into impassable country without a through line of communications, the risk of failure was inherent. On Aug. 3 Conta's attack was launched. An initial success was recorded in the capture of the Ludowa massif. But the rest of the advance, which culminated in the taking of Jablonica in the Bilyj Czeremos valley, was made with great difficulty; for the Russians, who were now at home in the hill country, fought with a religious fanaticism such as they had not yet been known to display. The Krauss group began their attack on Aug. 5, and advanced as far as Worochta. The 40th Honved Div. could only with difficulty overcome the Russian resistance, in spite of gallant efforts, and only won a few heights N. of Mt. Capul. As the struggles for these mountain positions, so skilfully defended by the Russians, necessitated long preparation, the Russians had always time to bring up new forces. Above all, bad weather began in the middle of Aug., making artillery operations difficult.

On Aug. 10 the German 1st Inf. Div. arrived at Kirlibaba, to reinforce the 40th Honved Division. The 3rd Cav. Div. was then transferred from Dornawatra to Krauss's group, to increase that group's power of attack. But already the Russians were launching their counter-attacks, having brought up 4 new inf. divs. against the Carpathian front. On Aug. 14 Krauss's group was overthrown at Worochta, and was forced to retire to the heights of the pass. An attack begun by their right wing, which was to have been assisted by the German 2nd Cyclist Bde., with the object of recapturing the Kukul height, was never carried out. For the cyclist brigade had to be hurriedly dispatched to Borsa, to hold a crossing momentarily threatened in consequence of a Russian inroad S. of the Tomnatik height. Meanwhile the Russians were also pushing forward against the Pantyr Pass, and half of the 3rd Cav. Div. was accordingly sent there. To ensure unity of command in the Pantyr–Jablonica Pass section, the I. Corps headquarters was transferred from the III. to the VII. Army. Further, the German 117th Inf. Div., which had now arrived just in time to ward off the violent Russian attacks on the Jablonica Pass, was placed under the I. Corps command. The 2nd Cyclist Bde. was finally transferred to the 3rd Cav. Div. at the Pantyr Pass where the Russians had pushed through up to the Hungarian frontier. At the end of Aug., in order to enable reserves to be formed, the Carpathian Corps also was withdrawn to a shorter line near the Hungarian frontier.

Pflanzer-Baltin's offensive had not got beyond the initial stages though from no fault of this experienced commander, for his well-considered counter-proposals had been ignored. The threat of Rumania's entry into the war made it necessary at the end of Aug. to put in the 11th Honved Cav. Div. on the right army wing at the junction point of three frontiers. The 10th Bavarian Inf. Div. and 5th Honved Cav. Div. were also brought up into this area.

On the Galician-Volhynian fronts no fighting actions of more than local importance took place during the second half of August. The Russians succeeded in penetrating the IV. and V. Corps of Böhm-Ermolli's Army, N.W. of Zalozce, but, after several days of counter-attack, everything, down to the last bit of trench, was recovered. On the Stochod, all that remained to the Russians as the prize of their persistent efforts and costly attacks was one small bridgehead S. of Tobol on the W. bank. From this they could not be dislodged, owing to the impossibility of bringing up heavy artillery.

In the second half of Aug. it became obvious that the Russians' summer offensive had lost its driving power. Brussilov had, it is true, recaptured nearly the whole of Bukovina and large portions of Eastern Galicia and Volhynia, at the cost of heavy sacrifices and of practically doubling the number of his divisions between the beginning of June and the end of Aug. But his main object, the total destruction of the Austro-Hungarian eastern front, had not been achieved. The structure of the Dual Monarchy's army had, however, shown dangerous signs of disruption. The difficulties that arose in fighting with an army that was full of Slavs, against the Russians, their brothers, were plain to all the world, being most clearly shown by the fact that more than 200,000 prisoners were taken from the Austro-Hungarian eastern front in the months of June, July and August.

The allies, in particular the Germans, had been obliged to take strong forces from the other fronts, where they could ill be spared, and put them into the battle S. of Polyesie without coming a step nearer to their war-aim, the final overthrow of the enemy. On the contrary a new enemy, the one-time ally, Rumania, had been enticed on to the stage by the Russian successes. On the evening of Aug. 27, simultaneously with the declaration of war, Rumanian troops crossed the Hungarian-Rumanian frontier. Gladly did exhausted Russia resign the rôle of attacker to her new ally, in the vain hope that this ally would succeed where the utmost efforts of the Russian Empire had failed.

(R. K.)

**LUCY, SIR HENRY** (1845– ), English journalist, was born at Crosby near Liverpool Dec. 5 1845. Educated in Liverpool, he began life in a Liverpool merchant's office, but soon became a reporter for a Shrewsbury periodical. In 1870 he joined the staff of the *Pall Mall Gazette*, London, and in 1873 became Parliamentary reporter to the *Daily News*, with which paper he had a long connexion in various capacities. In 1881 he also joined the staff of *Punch* as contributor of its Parliamentary sketch over the signature of "Toby M.P." He was knighted in 1909 and retired from Parliamentary work in 1916. He published his autobiography, *Sixty Years in the Wilderness*, in 1909, and *The Diary of a Journalist* in 1920.

**LUDENDORFF, ERICH** (1865– ), Prussian general, who was associated with Hindenburg in the Higher Command of the German armies, first on the eastern front and afterwards throughout the whole theatre of the World War, was born at Kruszevnia near Posen on April 9 1865. He was for a long period employed in the work of the general staff, and from 1904–13 he was in what was called the *Aufmarschabteilung*, the department which drew up the plans for the transport, disposition and advance of the troops to be employed in a prospective campaign. In 1908 he was appointed chief of this department. It was he who worked out the last great German Army bill, passed by the Reichstag in 1913. Almost all the proposals he had recommended were adopted without question, but three new army corps for which he had pressed were not even proposed by the War Minister. He believed that it was his insistence upon this particular proposal that led to his being removed from the general staff and sent to Düsseldorf to command the 39th Fusilier Regiment. (It may be noted here that, when he resigned on Oct. 26 1918, he was made hon. colonel of this regiment, which, until its dissolution by the republican Government, bore his name.) In April 1914 he was promoted to the command of a brigade at Strassburg and was there at the outbreak of the World War. He was at once made chief quartermaster of the II. Army under Gen. von Emmich, and proceeded to the western front, where he took part in the assault upon Liége. He accompanied the advance of the 14th Bde. of infantry, as a spectator, but, when its commander fell, he took command of it as the senior officer present and led it in a night march (Aug. 5–6) past the forts to the heights of La Chartreuse outside Liége. On Aug. 7, while the forts were still untaken, he entered the town of Liége with his troops and himself knocked at the door of the citadel, which was surrendered to him without a blow by its garrison of several hundred Belgians. For this feat he received the Prussian *Ordre Pour le Mérite*. He afterwards advanced with the II. Army as far as the Somme until Aug. 22, when he was sent to the eastern front as chief of the general staff of the VIII. Army in East Prussia, with Hindenburg in command. His first meeting with Hindenburg was when the latter joined him in the train at Hanover on his way to East Prussia. The battles of Tannenberg and the Masurian Lakes, which cleared East Prussia of the Russian invaders, at once placed Hindenburg and Ludendorff on a pinnacle by themselves in the estimation of the German people. In Nov. 1914 Hindenburg was appointed chief in command over the armies of the East (*Oberost*), with Ludendorff as his chief-of-staff.

On Aug. 29 1916 Hindenburg was made chief of the general staff of the whole army, and Ludendorff, who had been advanced to the rank of general of infantry, remained in closest association with him, as chief quartermaster-general. The tale of his work in conjunction with Hindenburg, of his successes and failures, belongs to the military history of the World War. In particular his name will always be associated with the great German offensive of the spring and summer of 1918 and with the collapse of that brilliant and audacious enterprise, followed by the disastrous German retreat, the overtures for an armistice and the dissolution of Germany's military power. Ludendorff's attitude towards the Government of Germany and his repeated political interventions form a very important chapter in the events which led up to the German collapse in the autumn of 1918. The motives of his political action are clearly revealed in his book *Meine Kriegserinnerungen* (1919). He maintains that he never desired to interfere in internal politics. He even complains in his book that successive chancellors and ministers forced him and Hindenburg into a false position by constantly adducing their approval for ministerial measures. The truth is that the whole German system, especially in time of war and in the absence of a commanding political personality like Bismarck, inevitably led to encroachments of military influence. Ludendorff denies that he brought about the fall of Bethmann Hollweg; but he was in communication with those leaders of parties whose views approximated to his own, and, after the Crown Prince, who was also in frequent communication with him, had seen the political leaders and had satisfied himself that they would offer no objection, the Emperor accepted his Chancellor's resignation. Ludendorff asserts in his book that he did his best to keep on terms with successive Imperial Chancellors. But he recalls that the machinery of the Government worked slowly, while he and his officers at the front were full of ardour and eagerness. There was often a delay of weeks in getting urgent things done, " and thus," he says, " the tone of communications between the front and Berlin sometimes became stern (*hart*)." In another place he speaks of " the struggle with the Government to obtain what the army required in order to achieve a final and decisive victory." Of Count Hertling he says, " Hertling was no War Chancellor." The kind of War Chancellor Ludendorff would have liked is revealed in his exclamation of despair: " Who was going to be Imperial Chancellor after the Emperor had repeatedly declared against Prince Bülow and Grand Adml. Tirpitz?" Ludendorff seemed to forget that the country, as represented by the majority, of the Reichstag, would have none of either of these candidates and that the Emperor, in addition to being himself alienated from Bülow, was becoming more and more dependent upon public opinion and more and more afraid of it. Ludendorff, on the other hand, whenever he refers to the Reichstag or to the leaders of parties, shows that in his conception their business was to rouse patriotic feeling in the country and to get the masses into a mood which would make them support the military leaders' conduct of the war through thick and thin. Thus he pointed out to the politicians of the Reichstag in July 1917 that the so-called Peace Resolution would have a depressing effect throughout Germany, and that in enemy countries it would produce an impression of German weakness. Perhaps he was right. In any case it was impossible for the Allied and Associated Powers to be content with the *status quo ante;* and the German supporters of the Resolution themselves departed from the principle of " no annexations and no indemnities " whenever successes of the German arms encouraged them to believe that Germany might be able to make more advantageous terms. Instances of this were the Peace of Brest Litovsk and the Peace with Rumania. In the negotiations for the first of these Ludendorff was impatient of Count Czernin's Austrian policy as regards Poland, and he desired the extension of German territory and influence on her eastern frontiers both as a military precaution and as a defence against the spread of Bolshevism.

In pursuance of his idea of improving the spirit of the army, Ludendorff caused to be organized under the superintendence of a Lieut.-Col. Nicolai a scheme for giving what was called " patriotic instruction " to the soldiers at the front. The services of a large number of invalided officers and others were enlisted to carry out this scheme. It ultimately developed in many instances into a system of espionage upon the political opinions of the soldiers, and the removal of Nicolai and other officers who were engaged in this work was one of the demands which the leaders of the majority in the Reichstag had put forward when, in Oct. 1918, they compelled the Chancellor, Prince Max of Baden, to break with Ludendorff and to bring about his resignation. Ludendorff had further attempted to extend his system of " patriotic instruction " to the interior of the country through the medium of the generals in command of the reserve corps formations. This home propaganda brought him and his subordinates into conflict with the Social Democrats, who were daily strengthening their hold upon the masses and were influencing them in favour of a " peace by understanding." The Independent Socialists were going still farther and were agitating in the trenches and on the ships of the navy for a military strike, such as actually took place at Kiel in the first week of Nov. 1918 as a prelude to the German Revolution. There were similar demonstrations at various points on the western front, where new recruits abused regiments going into action as " strike-breakers " and " blacklegs."

The most debated episode of Ludendorff's career is his action on Sept. 30 and Oct. 1 1918 in pressing upon the Government the immediate necessity of making overtures for an armistice. The view of the German republicans is that the retreating German armies on the western front were on the brink of a great disaster, that Hindenburg and Ludendorff were aware of this, and that they urged the necessity of an armistice in order to escape the worst. Ludendorff's contention amounts to a plea that he wanted an armistice on reasonable terms in order to enable the German army to be withdrawn to the frontier, where it might have time to reconstitute itself if necessary, with a view to resisting oppressive terms of peace by standing on the defensive. He seems to imply that he did not realize that neither the Allied Powers nor President Wilson would have agreed to an armistice of this kind. When Ludendorff saw the kind of terms which the Allied and Associated Powers were going to impose, he changed his attitude and desired the German Government to hold out. He had also, he says, formed the conviction by the end of Sept. that the Allied and Associated Powers were not in a position to press home an immediate and decisive attack. It was mainly the attempt to urge his changed views upon the Government of Prince Max of Baden that led to that Government's insistence upon Ludendorff's resignation being accepted by the Emperor on Oct. 26 1918. The immediate occasion of what amounted to his dismissal was a General Army Order, which had been issued on Oct. 24, informing the troops that President Wilson's final terms for an armistice were dishonourable to Germany and that the army must fight to the last gasp. This order was contrary to what Ludendorff knew to be the policy of his Government and he finds it necessary in his book to make excuses for having caused it to be promulgated. It was really as far back as Aug. 8 1918, as Ludendorff himself testifies, that he had lost confidence in the possibility of compelling the Allies by military pressure to accept what they would have regarded as a " German peace." After the German lines between the Somme and the Luce had been broken through by the British on Aug. 8, he had a conference (on Aug. 13) in the presence of the Emperor with the then Foreign Secretary, Adml. von Hintze, and advised overtures for peace, which Hintze proposed to initiate through the mediation of the Queen of Holland. According to Ludendorff, it was the delay of the Government in prosecuting these overtures that had made him impatient at the end of Sept. when he urged the immediate necessity of an armistice. It has even been alleged that in Aug. 1918 Ludendorff, under the influence of events at the front, had had a complete nervous breakdown.

As a military organizer and resourceful man of action in the field, Ludendorff has, perhaps, had no equal since Napoleon. He did not, however, possess Napoleon's insight into the necessities of domestic politics, while he shared Napoleon's inability, under

the stress of action and the spur of ambition, to realize either the limits of military success or the spirit of the nations he was attempting to crush. He was not exempt from personal vanity. Complaining of the action of the republican German Reich in altering the name of the popular contribution (*Kriegsspende*) of 150,000,000 marks, collected for war invalids, from "Ludendorff Fund" to "People's Fund," he says: "Could not the Republic have continued to let it bear my name—this fund which, precisely on account of its bearing my name, had brought in so much money and was so beneficial?" He was a master of caustic retort. Prince Max of Baden, instigated by his Socialist colleagues in the Government, had complained that the table of the officers at the front was in glaring contrast with the poverty of the common soldiers' rations, and had suggested that the officers should be content with the same food as their men. Ludendorff replied that the staff could not do its brain work on the common soldier's rations, but he would undertake to try to live on these rations, if Prince Max and the members of his Government would do likewise. "Prince Max," Ludendorff reports, "did not care to eat the soldiers' rations," and, accordingly, the subject was dropped.

After the revolution, Ludendorff knew that his influence in the country was gone and that he even ran the risk of being impeached by the revolutionary Government for having prolonged the war, as well as for his political activities. He, therefore, like Tirpitz, went abroad, choosing Sweden as his place of refuge, and did not return to Berlin till the spring of 1919. His behaviour after his return was ambiguous. He refrained from placing himself at the head of any reactionary movement, but he was always in evidence whenever such movements seemed likely to achieve any success. The reactionaries continued to regard him as one of their main hopes, and during some of their manifestations of 1919 he showed himself in the streets and was cheered by ex-officers and royalist crowds. During the days of the Kapp *coup d'état* (March 1920) he was a frequent visitor at the headquarters of Kapp's usurping "Government." After the failure of Kapp and his associates, Ludendorff betook himself to Bavaria, which, under the Government of Herr von Kahr (1920–1) and under a formal state of siege, was administered in a reactionary spirit. Bavaria thus became a refuge for Prussian plotters like Col. Bauer, Major Pabst and Capt. Ehrhardt, whose Marine Brigade had supported Kapp. The Prussian refugees seem to have enjoyed the protection of this Bavarian Government, and it was among them that assassinations like those of Gareis, the Bavarian Independent Socialist leader, and of Erzberger, the Democratic Catholic leader, were planned. It is unlikely that Ludendorff was associated with these particular schemes, but his name and his influence were identified with the royalist parties, whose unmeasured agitation favoured the wildest plots and contributed to the spirit which led to assassinations like that of Erzberger.

In addition to his *Kriegserinnerungen 1914–18* (1919), Ludendorff published *Fälschung meiner Denkschrift von 1912* (1919); *Entgegnung auf das amtliche Weissbuch, Vorgeschichte des Waffenstillstands* (3 pamphlets, 1919).

**LUDLOW, JOHN MALCOLM FORBES** (1821–1911), English philanthropist, was born at Nimach, India, March 8 1821, and was called to the bar in 1843. Becoming associated with Kingsley, Hughes and F. D. Maurice, he helped to found the Working-Men's College in Great Ormond Street in 1854, having previously (1850) founded and become editor of *The Christian Socialist* newspaper. He was secretary to the royal commission on Friendly Societies (1870–4). From 1875 to 1890 he was chief registrar of Friendly Societies. He was one of the first members and subsequently president of the Labour Co-Partnership Association. He died in London Oct. 17 1911.

**LUEGER, KARL** (1844–1910), burgomaster of Vienna, was born Oct. 24 1844, the son of an usher, and, studying under the greatest material difficulties, succeeded in qualifying as an advocate. He was at first a partisan of the Democratic party, then a leader of the Christian Socialists, an anti-Semite and advocate in the courts for artisans and "small men." He overthrew the German-Liberal municipal government of Vienna, and was elected burgomaster in 1895, but the Emperor did not confirm the appointment and Vienna was placed under the government of a State commission. In the new elections Lueger allowed another member of his party to be set up as dummy burgomaster, while he himself in form became vice-burgomaster. In 1897, however, when the "people's candidate," Lueger, was again elected burgomaster, the Emperor confirmed his election and repeatedly honoured him as a loyal patriot. Lueger, who was a powerful orator, was seven times elected burgomaster. He was a zealous Catholic, and wished to "capture the university" for the Church; he would have neither Social Democrats nor Pan-Germans nor Jews in the municipal administration. He secured good treatment for Czech immigrants, and established Viennese municipal electrical stations, gasworks and tramways, independent of the English gas and tramway companies. He planned to make Vienna one of the most beautiful of garden cities. He died March 10 1910.

(C. Br.)

**LUGARD, SIR FREDERICK JOHN DEALTRY** (1858– ), English administrator (*see* 17.115), in 1912 resigned his position as governor of Hong-Kong. From 1912 to 1913 he was governor of Northern and Southern Nigeria, the two protectorates having been unified in 1912.

His wife, Flora Louise Shaw, whom he married in 1902, was a well-known author and journalist. She was for some years a contributor to *The Times*, subsequently becoming head of the colonial section of that paper. In connexion with this work, she went as special correspondent to South Africa (1892 and 1901), and to Australia and New Zealand (1892) partly in order to study the question of Kanaka labour in the sugar plantations of Queensland. She also made two journeys to Canada (1893 and 1898), the second of which included a journey to the gold-diggings of Klondike. During the World War Lady Lugard was prominent in the founding of the War Refugees Committee, which dealt with the problem of the Belgian refugees, and also founded the Lady Lugard hospitality committee. She was in 1918 created D.B.E.

**LUND, TROELS FREDERIK** (1840–1921), Danish historian (*see* 17.123), published in 1906 *De tre Nordiske Brödrefolk* and in 1909 *Nye Tanker i det XVI. Aarkundrede*. In 1911–2 appeared his historical tales, *Tider og Tanker*. He died in 1921.

**LUTYENS, SIR EDWIN LANDSEER** (1869– ), English architect, was born in London March 29 1869. For one who was to occupy such a commanding figure in the whole world of modern English architecture, Sir Edwin Lutyens' art owes singularly little to a training and education of the usual description. After a couple of years at the South Kensington schools he was at first placed in the office of an architect in the country, with whom he remained for the briefest possible time, passing afterwards a year with Mr. (later Sir) Ernest George. His first commission came to him at the age of 19, and, from this and his other early experiences, he has himself remarked that the best training for an architect is the building of houses. His earliest important work (1890) followed shortly after this—Crooksbury—to which some eight years later he made very characteristic additions, which interestingly show his development and his enlargement of the principles of Norman Shaw and Philip Webb—particularly the latter—as well as his growing grasp of abstract design. Amongst other strong influences on his thought and work should be counted his early association with Miss Jekyll, the gifted designer and contriver of gardens treated as an integral feature of the homestead, and playing a part of the greatest importance in its design and treatment. At "Hestercombe," a not very interesting house from another hand, Lutyens carried out his largest essay in garden-work, suggesting the finer manner of such work as was done under William III. and Anne, rather than the less elaborate and smaller methods of the Elizabethan period. His many houses in Surrey—such as "Orchards"—show him as carrying still further his development in the direction of individuality in his design, tempered by a reticence that has always kept his work far removed from attempts at "originality"—a quality based

upon the impossible. A fine house at Sonning—"Deanery Gardens"—is a later important essay in half-timbered design, and the value he has always placed on a varied use of materials, as giving different qualities of texture to a building, found expression in "Daneshill," one of his earliest uses of the small bricks he affects so much. "Marshcourt," again, with its interesting play of contrasting chalk and flint, shows Lutyens, designing a house that would be Tudor in style and treatment if it were not essentially modern and his own. Much of his domestic work has been in the direction of the restoration of, and adding to, old houses. The largest example of his powers in this direction is the treatment of Lindisfarne Castle, Holy I., where he carried out, during upwards of nine years (1903–12), a very complete and yet conservative restoration. Sir E. Lutyens' civic work shows equally with his domestic design a personal quality, in such buildings as that for the *Country Life* offices in London, and for the British Sections at the Exhibitions in Paris (1900) and in Rome (1911). The Garden Suburb at Hampstead has important examples of his treatment of small houses, as in the large Central Square, and of his method of dealing with church design. His two churches in the centre of the square, planned for use by supporters of differing schools of religious thought, are neither of them on the conventional lines of ecclesiastical design, but show in each case a characteristic simplicity and culture.

It was, however, as principal architect of the New Delhi (*see* DELHI) that the culmination of Sir E. Lutyens' professional career was reached. In 1912 a committee, on which Sir Edwin served, and which included Mr. H. Baker and Mr. Lanchester, visited Delhi with a view to advising the Indian Government as to the practical considerations involved in the scheme for the new capital. The plan adopted was elaborated in detail and in what may be described as "the Grand Manner" by Lutyens and H. Baker. Another conspicuous success of a more popular character was his design for the Cenotaph in Whitehall. The nation's memorial to those who died in the World War, of which Sir E. Lutyens had provided a temporary model for the Peace celebration in 1919, was in 1920 perpetuated in stone as a lasting monument. Its striking simplicity, dignity and proportion lift it above the level of the host of memorials that followed the war.

Sir Edwin was elected an Associate of the Royal Academy in 1913 and a full Academician in 1920. The Royal Institute of British Architects awarded him its gold medal in 1921. He was knighted in 1918. In 1897 he had married Lady Emily Lytton, daughter of the first Earl of Lytton.

**LUXEMBURG, ROSA** (1870–1919), German Socialist and revolutionary agitator, was born a Jewess on Dec. 25 1870 in Russian Poland. Her earliest political activities in her student days were connected with the Socialist movement in the country of her birth, but about 1895 she migrated to Germany. She there went through the form of marriage with a German workman named Luxemburg with the object of acquiring German nationality. In 1898 she edited for a short time the Saxon *Arbeiterzeitung*, but soon afterwards became a member of the staff of the *Leipziger Volkszeitung*. She took part in the Russian revolutionary movement of 1905 in Russian Poland, but soon returned to Germany in order to engage in extreme Communist propaganda and founded together with Karl Liebknecht the Spartacus League. In 1914, after the outbreak of war, she was sentenced to a year's imprisonment for inciting to insubordination and remained throughout the war in preventive custody (*Schutzhaft*). After the revolution she edited in conjunction with Karl Liebknecht the *Rote Fahne*, the organ of the Spartacist or Communist advocates of violent revolutionary methods. After the Jan. (1919) street fighting in Berlin, of which she and Liebknecht were the chief instigators, both agitators were for some days in hiding, but were ultimately arrested and conveyed to temporary military headquarters of the Government forces at the Eden Hotel in the west end of Berlin, on the night of Jan. 16 1919. The mob and some of the soldiers became menacing in their attitude towards the prisoners, so that it was deemed advisable to convey them to one or other of the Berlin prisons. Liebknecht was shot on his way to the Moabit prison, while Rosa Luxemburg was brutally attacked on leaving the hotel and was finally shot dead as she was being conveyed, insensible from her injuries, in a motor-car under a military escort. Her body was thrown into a neighbouring canal and was only recovered some months later.

**LUXEMBURG** (*see* 17.145).—The Grand Duchy as a whole is a plateau 1,000 ft. above sea-level on the N. and N.W., sloping down to S.E. into the Moselle valley, a deep and winding gorge which forms its frontier on this side.

The whole district is furrowed by deep river valleys, and falls into two contrasted divisions, the Ösling or northern portion and the Gutland or southern. The Ösling forms part of the Ardennes-Eifel massif, a high and bleak plateau with a cold, swampy clay soil overlying Devonian and Silurian rocks. Here only the river valleys are fertile or at all thickly inhabited; the plateau, which is over 1,300 ft. above sea-level, has little agriculture (oats, rye, potatoes; hay in the valleys) and a thin population. The Gutland, so called on account of its relative fertility, is a part of the Lorraine plateau, geologically composed of Jurassic formations (mostly oölites and marls) with some Triassic sandstones. Here the lower elevation and the comparatively good calcareous soils, even apart from the presence of iron ore, enable the country to support a denser population. Even here the soil is not rich; on the oölites it is thin and dry, on the marls cold and heavy; but a good deal of wheat is grown, some barley, beets, peas and beans, and some lucerne.

The Luxemburg section of the Moselle valley, like its German continuation north-eastwards, is warm and sheltered, and contains extensive vineyards which, together with orchards, occupy the greater part of the Moselle valley communes. The main centres of wine-growing are Wormeldingen, Wellenstein, and Remerschen: Grevenmacher is the chief market. A few vineyards may be found in the lateral valleys, but never very far from the Moselle except up the Sauer, where isolated examples occur even as far up as Vianden. The total vineyards occupy 1 % of the cultivated area.

The amount of live stock kept is negligible except for pigs, which are common everywhere.

The average density of the pop. is 246 per sq. m. for the whole country. The valleys generally, the centre round the capital, and the iron-working district of the extreme S.W., are somewhat densely inhabited, especially the last named, which has a pop. of 1,000–3,000 per square mile. The main river valleys have a density of 200–400, rising in the neighbourhood of the towns: the Gutland plateau an average of 150, and the Ösling below 100. The rainfall varies from rather over 30 in. in the extreme W. to 25 in the E.

The Grand Duchy possesses a small portion of the extreme N. end of the famous *minette* iron-field of Lorraine. The ore occupies a continuous stratum in the so-called Dogger beds of the Jurassic oölite. Its importance is due to the great size and continuous character of the deposits, and to the special suitability of the pig-iron produced for conversion into steel by the basic process. The Luxemburg portion of the field (14 sq. m., of which the unexhausted portion was estimated in 1913 to contain 270,000,000 metric tons of ore) yields 7,000,000 tons of ore per annum; this is mostly smelted in the Grand Duchy, apart from a certain amount exported to Belgium. The output of iron and steel is declining; that of pig was 1,950,514 tons in 1916 as against 1,266,271 in 1918, while the output of steel declined in the same period from 1,296,407 tons to 857,937.

Industries occupy over a quarter of the population. Of the total industrial population one-third works in the mines and furnaces of the iron district, which also contains mechanical construction, electrical and other factories of similar kinds. The centre of the country has a fair number of industrial establishments, including foundries, potteries, textile works, saw-mills and quarries. In the capital there are 4,000 industrial workers, especially engaged in the production of food-stuffs and hardware. The northern districts have practically no industry, and the same is true of the east, which lives chiefly by its wines and fruit.

The population is prevailingly Germanic in speech, but this has only been the case since 1839, when the present western frontier was drawn, whose claim to be a natural frontier rests on the fact that it roughly corresponds with the linguistic frontier between Teutonic and Romance dialects.

The entry of the Grand Duchy into the German Customs Union (1842) marked the beginning of a close economic union with Germany which was the chief cause of Luxemburg's industrial development. Her railways, on the other hand, were in 1857 taken over by the Eastern Railway Company of France. After the Franco-German War Germany deprived the French Eastern Co. of its rights and worked the Luxemburg railways herself as part of the Reichsland system, pledging herself not to use them for the transport of troops or munitions in time of war, a pledge which, however, was not taken into account in the plans of the German general staff.

On Aug. 2 1914 the capital and the chief railway bridges were seized by German troops, which had already entered the country on the previous day. The protests of the Grand Duchess Marie Adelaide and the Government were ignored, and the country remained in German hands for the remainder of the World War. The native authorities were allowed to conduct the civil administration, but there was a strict German censorship of post, telegraphs and telephones, and for some time the German Emperor resided in the Grand Duchy. There were no allegations of German atrocities, but the openly Francophil attitude of the inhabitants led to a good deal of friction and was probably responsible for such events as the Cabinet crisis of 1915. The American troops which entered the capital after the Armistice, on Nov. 22 1918, were received with the greatest enthusiasm.

On the conclusion of the war it became necessary to reconsider both the position of the Grand Duchy as a member of the German Zollverein and of the Grand Duchess, whose German sympathies were in conflict with the general views of her subjects. She accordingly abdicated in favour of her sister Charlotte Adelgonde early in 1919, and a referendum was held later in the year to decide the political and economic future of the country. The Treaty of Versailles acquitted Luxemburg of her obligations towards Germany, and it was known that the Peace Conference would not permit the resumption of the old relation, even if the Luxemburgers had wished it. Voters were therefore asked to choose between economic union with France and with Belgium, and between the existing Grand Duchess, a new ruler, and a republic. They resolved by a large majority upon economic union with France and on the retention of their constitution and of the Grand Duchess Charlotte. (R. G. C.)

**LUZZATTI, LUIGI** (1841– ), Italian statesman and economist (*see* 17.148), was Minister of Agriculture in the second Sonnino Cabinet (Dec. 2 1909–March 21 1910), and on the resignation of the latter was called upon to form a Cabinet himself. His administration, which lasted until March 18 1911, was not very successful. Although a man of first-class financial ability, great honesty and wide culture, he had not the strength of character necessary to lead a Government; he showed lack of energy in dealing with opposition and tried to avoid all measures likely to make him unpopular. Furthermore he never realized that with the Chamber, as it was then constituted, he only held office at Giolitti's good pleasure. During the World War he was consistently pro-Ally and strongly supported Italian intervention, but his tone was on the whole pessimistic. Although he did not take office while the war lasted, he was always consulted on all financial matters, and his sound advice was generally followed. He became Treasury Minister in the second incarnation of the Nitti Cabinet (March 12–May 10 1920), but did not resume office in the third. At the general elections of May 1921 he decided not to stand for Parliament again, and was made a senator. In spite of his great age, he continued to write on economic and financial problems with his accustomed lucidity and soundness of judgment, insisting on the necessity for Italy to return to freedom of trade and to reduce Government interference in business matters to a minimum.

**LVOV, PRINCE GEORGE EUGENIEVICH** (1861– ), Russian statesman, was born in 1861, and belonged to the old Russian nobility. After taking his degree in law in 1885, he spent the greater part of his life in Zemstvo work. He was a member of the executive board of the Tula Zemstvo from 1888 and president of the same from 1902 to 1905. In 1905 he was elected member of the first State Duma and joined the right wing of the Constitutional-Democratic party; he also took part in the All-Russian Assembly of Zemstvos. He refused to sign the Viborg manifesto. In 1909 Lvov went to Canada to study the emigration question in that country.

During the Russo-Japanese War Lvov was the leader of the Zemstvos' organisation for the relief of wounded and disabled soldiers. The Minister of the Interior, M. Plehve, tried to stop the development of the Zemstvo work in this direction, because he disapproved of its liberal tendencies. But Lvov contrived to extend the activities of his organization in such a way that even the Government were obliged to recognize the ability of its work and on many occasions called upon it for assistance. From the beginning of the World War Lvov took a leading part in the organization of the All-Russian Union of Zemstvos and Towns for the relief of sick and wounded soldiers, of which he was the president. The activities of this organization were of the greatest value to the army; the administrative incompetence of the Government obliged the latter against its will to enlarge the sphere of action of the Zemstvos' Union, which took a large share in the supervision of production and distribution of munitions and food supplies. In the conflicts which arose continually between the Government and the Zemstvos, Lvov always defended the independence of his organization. He also participated in the manifestations directed towards liberal reforms during the last period of the old régime.

As one of the most popular public men of Russia he was elected Prime Minister and Minister of the Interior of the first Russian Provisional Government, on March 14 1917. Unfortunately he did not possess the qualities needed to save Russia from the approaching catastrophe. His popularity diminished with amazing rapidity and in a few weeks his Government proved a complete failure. On May 19 Lvov addressed a letter to Rodzianko and Tchkeidze, insisting on the creation of a Coalition Government. The new Cabinet was formed on May 17, and Lvov again accepted the leadership of the Cabinet and the portfolio of the Interior, but he had no real influence in political life, and he resigned from both offices on July 7, ceding the place to the first Kerensky Government. Lvov was arrested and imprisoned in Ekaterinburg after the Bolshevist revolution, but he escaped to Siberia and was sent to Japan as the head of a deputation of the anti-Bolshevist Ufa Government. From Tokyo he proceeded to Europe by way of the United States. On his arrival in Paris Lvov took an active part in the anti-Bolshevist agitation and joined the so-called " Political Consultation " in Paris. Together with some other Russian public men he protested against the proposal of the Prinkipo Conference, and warned the Allies that no treaty with the Soviet Government would be recognized by the future Government of Russia. Lvov always advocated loyalty to the Western Alliance and admitted of no compromise with the Bolsheviks.

**LYALL, SIR ALFRED COMYN** (1835–1911), English writer (*see* 17.148), died in the Isle of Wight April 10 1911.

**LYALL, SIR CHARLES JAMES** (1845–1920), English orientalist, was born in London March 9 1845 and educated at King's College, London, and Balliol College, Oxford. He entered the Bengal civil service in 1867 and had a distinguished career as an administrator, becoming secretary to the Home Department of the Government of India in 1889, chief commissioner of Assam in 1894 and of the Central Provinces from 1895 to 1898, whence he was transferred to the India Office at home as secretary to the Judicial and Public Department, a post which he held until his retirement in 1910. But his greatest claim to distinction lay in his studies in Arabic literature. He published two volumes of translations of Arabic poetry (1885 and 1894), a translation of two ancient Arabic *Diwāns* (1913), as well as articles on Hindustani and Arabic literature in the *E.B.* 9th and 11th editions. He was made K.C.S.I. in 1897, and was elected a fellow of the British Academy, and he received hon. degrees from the universities of Oxford, Edinburgh and Strassburg. He died in London Sept. 2 1920.

**LYAUTEY, LOUIS HUBERT GONZALVE** (1854– ), French marshal, was born at Nancy Nov. 17 1854. He entered St. Cyr in 1873 and two years later was appointed a sub-lieutenant. He was nominated to the old staff corps (*Corps d'État-Major*), but when that corps was abolished transferred to the cavalry, with which he served chiefly in Algeria until 1894. He became a lieutenant in 1878, a captain in 1882 and major in 1893. In 1894 he was made chief-of-staff to Gen. Galliéni, and took part in the operations in the upper valley of the Song-Caw in 1895 and against the pirates of Upper Tonkin in 1896. In the latter year he went with Gen. Galliéni to Madagascar and took an important part in restoring French domination in that island. He

was promoted lieutenant-colonel in 1898 and colonel in 1900. He returned from Madagascar to France in 1902 and was given command of the 14th Regt. of Hussars. On Oct. 9 1903 he was promoted general of brigade and four years later (July 30 1907) was made a substantive divisional general and placed in command of the Oran division. On April 28 1912 he was appointed resident general and commissioner in Morocco—an appointment which he held continuously until Dec. 1916, when he relinquished it, against his own wish, to become Minister for War under M. Briand's premiership. He resigned his portfolio in March 1917 and thereby precipitated the fall of the Briand Cabinet. He then returned to continue his work in Morocco. He was admitted to the French Academy in 1912. He received the Grand Cross of the Legion of Honour on Sept. 17 1913, and was made a marshal of France in Feb. 1921 in reward for his great services as a soldier-proconsul in that N. African empire which many Frenchmen regard as the future basis of their national power.

**LYDEKKER, RICHARD** (1849–1915), English naturalist and geologist, was born in London July 25 1849. He entered Trinity College, Cambridge, where he took a first-class in the Natural Science tripos (1871). He joined the staff of the geological survey of India in 1874, remaining in this post till 1882. He became very widely known as a naturalist, and was elected a fellow of the Royal Society in 1894. His works include *Catalogues* (in 10 vols.) of the fossil mammals, reptiles and birds in the British Museum (1891); *A Manual of Palaeontology* (with Prof. H. A. Nicholson, 2 vols., 1889); *Phases of Animal Life* (1892); *The Royal Natural History* (with Sir W. H. Fowler, 8 vols., 1893–6); *The Great and Small Game of India, Burma and Tibet* (1900). He died at Harpenden April 16 1915.

**LYONS, SIR JOSEPH** (1848–1917), British caterer, was born in London Sept. 29 1848 and educated at the Borough Jewish school. In early life he studied painting and exhibited at the Royal Institute, but by 1886 he had turned to business enterprises, in conjunction with the brothers Isidore (d. 1920) and Montagu Gluckstein. He began by catering at public exhibitions. He next opened tea-shops in London, the first in 1894; 20 years later these numbered over 200 and provided cheap food for the large class of clerical workers and junior members of professions. Later he opened several restaurants of a more ambitious nature, as well as hotels on the "no-tipping" principle. He initiated the athletic side of the Territorial Army scheme, and, for his services in this direction, was knighted in 1911. He died in London June 22 1917.

See Mrs. Stuart Menzies, *Modern Men of Mark* (1920).

**LYS, BATTLE OF THE** (1918).—In the great German offensive of 1918 the idea of breaking through the British-Portuguese front in French Flanders had from the first played a considerable part in the scheme of attack considered by Rupprecht's group of armies. Under the code name "George," this was originally intended as the operation to force a decision, but it shrank later—as "Little George" ("Georgette")—to a diversion, and was eventually dropped altogether in favour of the "Michael" operation (*see* WESTERN FRONT CAMPAIGNS). Only the preparations for it were carried out, immediately before the main attack in the Somme area, to mislead the opponent. Arrangements had also been made to revert quickly to the attack in Flanders in case the Somme offensive should come to a standstill.

When, on March 30, the great battle in France actually was broken off, the German Supreme Command snatched at the Flanders attack—now "Georgette"—which was limited in extent. There the second blow was to be struck at the British army. They could not expect to decide the war here, where the means were considerably more scanty than in the March offensive, but they hoped for a break-through in the direction of St. Omer-Hazebrouck and considerable gains of ground towards the coast. An extension of the break-through towards the S. was a secondary consideration only.

The conditions were favourable to carrying out the operation. The dry weather held out hopes that the Lys plain would prove practicable. The Portuguese, put in S. of Armentières, were inferior as opponents, and the Flanders front had had an extraordinarily weakening effect on the British. Everything depended on whether the Lys depression, which was difficult to traverse and impossible to reconnoitre, could be conquered so quickly as to prevent renewed resistance on the river itself, and the use of the rising ground beyond the Lys and the Lawe for the defence.

The main German attack was entrusted to the VI. Army under von Quast, with the Corps Staffs II. B, XIX., LV. and IV. For this purpose the Army was to put in 17 divisions in all. The attack was to be led from the line Armentières–La Bassée canal, with its centre of gravity on Hazebrouck. The IV. Army under Sixt von Armin, in the event of the VI. Army's attack having sufficient success, was to advance with a strong left wing to the W., passing N. of Armentières, which in itself was to be left untouched and made to fall by envelopment. Four divisions of the IV. Army, under the Staffs of the X. and XVIII. Reserve Corps, were to take part in the attack. The further development of the attack was to depend upon whether the heights S. of Poperinghe could be reached. If this were achieved the British and Belgians would be threatened from the rear, and their evacuation of the positions stretching northwards to Dixmude could be counted upon, if the subsidiary attacks arranged for by the IV. Army at this town and from the Houthoulst forest were carried out. The destruction of the important mining and industrial centre in the Béthune region might also be expected if the left wing, in accordance with the progress of the centre, should wheel in to the south-west. It was particularly important here, as in the March offensive, to succeed in really surprising the enemy. The successful crossing of the Lys especially depended on this. Emphasis was therefore laid on the need for the utmost haste. April 8 was the date desired for the attack, but in the end the VI. Army's attack had to be postponed till the 9th. The IV. Army's attack was fixed for the 10th.

The armies made their preparations with the greatest zeal and with scrupulous care, guided by the same principles as in the attack in the Somme area. By direction of the Supreme Army Command the artillery programme was revised by Colonel Bruchmüller. The order of battle gave the VI. Army nine divisions in the first, five in the second, and three in the third line; the IV. Army had three divisions in the first and one in the second line. The first- and second-line divisions were placed under the Corps Staffs, the third-line divisions under the Army Higher Command. To reënforce the attack still further, 14 more divisions were specially sent in the course of the battle, 9 by the army group, 5 by the Supreme Army Command. On an average the troops used were inferior to those in the March offensive. Quite a number of them were not fitted out and trained as attack divisions. But in spite of this both leaders and troops were full of confidence.

The attack itself was prepared by the artillery in the same way as that of March 21. Gas-shelling by the VI. Army began at 4:15 A.M., and, according to British reports, succeeded in poisoning the ground for miles behind the British front line. The deployment of the infantry had been carried out without any serious counter-measures on the part of the enemy. At 8:45 A.M. the infantry passed to the assault, meeting with only slight resistance, but found themselves, like the artillery, hindered by the mist hanging over the Lys depression, which greatly hampered their leading and the communication of information. In spite of this all three lines of the first position had been passed by 10 A.M. But now came the great problem of crossing the area under shell-fire with artillery and transport. The roads ran unfavourably, and were almost all destroyed. The ground was still soft in many places, and the shell-holes full of water. A few downpours of rain shortly before the day of the attack had made the condition of the ground worse. In spite of the immediate sending forward of pioneers and engineers and of the devoted zeal they put into their work it was only possible to effect a gradual improvement and to make at least the more important roads passable. On the first day only some few guns were got up to the front, in immediate support of the attacking infantry. This difficulty was distinctly felt when fresh resistance was encountered on the Lys. Nevertheless the initial success was

considerable. The Portuguese divisions were as good as annihilated. The II. Bavarian Corps turned in to the left and took Bois Grenier and Fleurbois. The XIX. and LV. Corps pushed through to the Lys. General Hoefer crossed the Lys at the lock E. of Sailly on April 9, thus enabling the troops attacking in a westerly direction to reach the opposite bank in the night of the 10th. The crisis which threatened to develop in the afternoon, owing to the wearied German troops coming on fresh British reserves, was thus overcome. Further S. the LV. Corps, commanded by von Bernhardi, reached the Lawe at certain points. On the left wing the IV. Army Corps took Richebourg l'Avoué, but failed to break the British resistance in the strongly fortified villages of Festubert and Givenchy.

This result did not come up to the Supreme Army Command's expectations. All depended now upon whether the next few days would bring a more rapid advance. With the VI. Army this was not the case. The British machine-gun nests gave the German infantry much trouble, as the guns necessary for destroying them could only be brought up with difficulty. An independent success was gained by the II. Bavarian Corps, which reached La Chapelle d'Armentières after more or less violent fighting. These troops, having advanced across the Lys at Sailly, had at first to repel some heavy British counter-attacks. They then pushed forward—after being reinforced—to Steenwerk, and so made the Lys crossing at Erquingham available. Further W. there was some heavy fighting round Pont Mortier. Here, too, some very lively British attacks were repelled. The XIX. Corps took the town of Estaires by house-to-house fighting and opened up the Lys crossing from La Gorgue. The LV. Corps managed to cross the Lawe between Lestrem and Vieille Chapelle. Of the IV. Corps only the right wing was able to advance with heavy fighting. On the left it could do no more than defend itself against heavy counter-attacks coming from Festubert. It was plain that the British were concerned above all to prevent any further rolling up of their front to the south.

Meanwhile the IV. Army had begun its attack. In the night of April 9–10 its artillery prepared the attack by several hours' gunfire, but without quite silencing the opponent's guns. Under cover of darkness the left wing of the X. Reserve Corps crossed the Lys, which flowed immediately in front of the opposing lines. At 5:15 A.M. came the infantry attack delivered from Warneton and from either side of it. From the first it encountered violent resistance. But the XVIII. Reserve Corps succeeded in enveloping and taking Meesen, and in holding it against heavy counter-attacks. The Hollebeke Park was also taken, and the attack carried to within 800 metres of Wytschaete. The X. Reserve Corps pushed through to the eastern boundary of the Ploegsteert Wood. Its left wing reached Ploegsteert village and Le Bizet, and repelled some violent counter-attacks. Behind the front the Lys was bridged at Deulemont and Frélinghien.

For this army, too, the difficulties were considerable. The completely ruined country of the Wytschaete battle-field (1917) made it extremely difficult to move or to judge what position had been reached. The superiority of the German artillery was not sufficiently great. The time for preparation had had to be cut very short; and the forces available were disproportionately weak. The success gained was all the more noteworthy.

The British were again chiefly concerned with reënforcing their wings which had held firm, and tried thereby to prevent the operative development of the break-through and the rolling-up of the adjoining fronts. A continuation of the German attack still, however, offered fair prospects. The army group therefore brought up further reënforcements on to the roads. The attack itself was resumed on April 11, with lively fighting. The XVIII. Reserve Corps pushed its way into Wytschaete, and established itself later E. of that place and in advance of the Wytschaete-Meesen road. The X. Reserve Corps took the Nightingale height (between the Douve brook and the Ploegsteert Wood) by envelopment from the Ploegsteert Wood, and its left wing a new position at Romarin. Further S., the town of Armentières, with more than 3,000 men, 45 guns and ample stores, fell into the hands of the Germans. The II. Bavarian Corps pushed through Nieppe to the Steenwerk railway station. The XIX. Corps succeeded by vigorous fighting in reaching Neuf Berquin church. The LV. Corps took Merville and Lestrem.

On April 12 no particular progress was made by the Germans. On the other hand, the counter-assaults to which the British had now resorted were all repelled in each case. The VI. Army took the northern portion of Calonne and the village of Lâcon. An order from the army group on April 12 arranged for the continuation of the attacks by the inner wings of the two armies. Besides this the VI. Army was to prepare for the continuance of the attack on the left wing according to plan. It was still important for the Germans to force a way into the hilly country N. of Bailleul, in order to relieve the position of the troops still remaining on the plain, and to excercise a strategical influence on the Yser front. But the British resistance had been greatly strengthened in the meantime, and the German attack could only proceed spasmodically and in limited sectors.

The next effort, on April 13, was directed against the Nieuwekerke–Bailleul range of hills. The 36th Reserve Div. succeeded, though with heavy losses, in taking the high-standing Nieuwekerke from across the exposed plain. The heights W. of that place were also captured. The VI. Army made only slight progress. The XIX. Army Corps took Merris. Some portions of the LV. Corps, which had penetrated into the Nieppe Wood, had, however, soon to give ground again.

On April 15 the corps of the IV. Army, to which the Guard Reserve Corps had been added on the left wing, pushed on towards the hill of Kemmel. The XVIII. Reserve Corps got beyond the Wulverghem–Wytschaete road. The X. and the Guard Reserve Corps climbed the heights W. of Wulverghem and E. of Bailleul in the afternoon.

In spite of these advances at independent points the attack had, substantially, come to a standstill. The army group hoped to set it going again by a "Tannenberg" assault from the Houthoulst forest. This was to be directed against the line Merckem–Langemark, and was intended to force the British and Belgians to evacuate the northern part of the Ypres salient. But before the preparations were definitely arranged the Entente armies in the night of April 15–16 evacuated their positions from Poelkapelle to Hollebeke and retired to a position nearer Ypres. By this they gave up the whole gain of the battle in Flanders in 1917. The IV. Army immediately decided to follow up their advantage. After a short burst of fire the first-line troops advanced and, by evening, had reached the line Mangelaere–Langemark–Veldhoek. The XVIII. Reserve Corps took Wytschaete and the heights N.W. of Wulverghem; the Guard Reserve Corps in conjunction with the VI. Army's right wing took Bailleul; and the III. Bavarian Corps—which had replaced the II. Bavarian Corps—took Meteren.

Here the battle of Armentières ended. The IV. Army encountered strong British-Belgian resistance at the Steen brook and gave up the projected attack there as hopeless. On the following day a German division was even forced backwards a little by a Belgian attack coming from Merckem. The attack, prepared some days before, by the left wing of the VI. Army (the IV. Army Corps and IX. Reserve Corps) against Bernenchon–Hinges and Festubert–Givenchy had no success.

Everywhere the strengthening of the resistance on the British front was evident, French divisions and batteries having been brought up here in daily increasing numbers. Only an organized attack, necessitating a great employment of force, would have been capable of overthrowing them. The German Higher Command had no intention of attempting this, for in default of any surprise the conduct of the attack, if resumed, would necessarily have approximated to battles of material, favourable in their nature to the other side, and only capable in any case of minor results. The army group, therefore, made a proposal on April 18 which was sanctioned by the Army Command on the 20th, that the Georgette attack should be abandoned. Only Mt. Kemmel, and, by order of the Higher Command, the much-fought-over villages of Festubert and Givenchy, were still to be taken—in particular Mt. Kemmel, the possession of which was

necessary to safeguard the situation of the inner wings of the two armies. But even so the battle of Armentières had meant an important success for German arms; 22,000 prisoners, 400 guns, thousands of machine-guns and a mountain of stores fell into the hands of the Germans. A considerable portion of the British army and the whole Portuguese auxiliary corps would for a certain period be unfit for fighting. Strong French forces had been removed from their own front to assist the British, and any possible plans the French Higher Command had formed for an offensive must have been hindered. The creation of a new salient was balanced by a shortening of the German lines opposite Ypres. The captured heights, in particular those around Wytschaete which commanded the whole of the Ypres depression, formed the given point from which new attacks could be undertaken, especially in case Mt. Kemmel should still be captured. The fact that it was possible to take the Béthune mines and the railway lines of Hazebrouck and Poperinghe under artillery fire added considerably to the difficulties of the enemy.

Mt. Kemmel, the eastern spur of the Bailleul heights, commands a wide view over the plain of Flanders to the S., E., and N., and provides an unrivalled observation point for those in possession. Any troops lying in the low plain beneath it must be prepared for intensive artillery action, and when, as in case of the VI. Army, their flank and rear were exposed to the artillery observers on the hill, the position was intolerable. The German Higher Command entrusted the attack on Mt. Kemmel to the XVIII. and X. Reserve Corps. April 25 was fixed as the date of attack. By that time some fresh forces at least could be placed in readiness. To make the attack easier the X. Reserve Corps took the Vlengelhoek heights N.E. of Bailleul and held them against sharp counter-attacks. On April 25 the attack troops were to reach the line from St. Eloi–Groote Vierstraat (1 km. N. of the village of Kemmel and the hill) to the village of Dranouter. The attack began at 3:30 A.M. with a particularly powerful gas attack. At about 6 A.M. this was followed by a bombardment, and this in turn by the assault at 6:45. Simultaneously battle-planes and bombing squadrons broke loose against the enemy positions and the communication centres. The attack, well prepared by the gas, was a complete success. The XVIII. Reserve Corps took Kemmel village and, later on, St. Eloi. The Alpine Corps stormed the hill and pushed forward its most advanced sections to the so-called Scheipenberg. The left wing of the X. Reserve Corps reached Dranouter and gained ground N. of Vlengelhoek. The objective of the attack had, accordingly, not only been reached but in part exceeded, although the German plans, as was subsequently discovered, were known to the enemy, and the element of surprise was consequently lacking. In consideration of this rapid success the attack was to be resumed on the 26th after renewed artillery preparation. The Entente, however, forestalled this attack by a counter-attack on a large scale, which came to grief. Mt. Kemmel remained in German hands on that day and for nine days after. Other detachments coming on behind took possession of Lokeren.

By April 27 the results of the Mt. Kemmel victory were evident. The British again gave up a wide strip of ground to the E. and S.E. of Ypres.

An additional result was the capture by the Germans of 7,100 prisoners, 53 guns and 233 machine-guns. As a point of issue for a renewed offensive in the future Mt. Kemmel was also of the first importance. For the time being the offensive in Flanders had reached its close with the victory of April 25–26.

(W. M.-Lo.)

**LYTTELTON, ALFRED** (1857–1913), English politician, was the youngest child and eighth son of the 4th Lord Lyttelton, a brilliant scholar who had been senior classic at Cambridge. His mother, daughter of Sir Stephen Glynne and sister of Mrs. W. E. Gladstone, died six months after his birth. All the eight boys were brought up to be keen cricketers, the cricket-ground at Hagley, Worcs., their home, being close to the house; all went to Eton, and six were in the Eton eleven. Many of them distinguished themselves in after life. The eldest, VISCOUNT COBHAM (1842– ), became a land commissioner and a railway commissioner; GENERAL SIR NEVILLE LYTTELTON, G.C.B. (1845– ), an experienced soldier and governor of Chelsea hospital; SPENCER LYTTELTON, C.B. (1847–1913), three times private secretary to Gladstone when Prime Minister; the RIGHT REV. ARTHUR LYTTELTON, D.D. (1852–1903), Bishop of Southampton; and the REV. EDWARD LYTTELTON, D.D. (1854– ), headmaster, first of Haileybury and then of Eton. Alfred, the youngest, was the most famous cricketer of them all. Indeed, for nearly all ball games he had an extraordinary aptitude. He excelled in football of three kinds, and in fives, racquets, and especially tennis—holding the amateur championship for tennis from 1882 to 1896. Golf he did not take up till comparatively late in life; and, though he became keen on the game, he never attained more than a moderate proficiency. At cricket he was equally good as a bat and as a wicket-keeper. He was four years, 1872–5, in the Eton eleven, and captain the last year; four years, 1876–9, in the Cambridge eleven, and captain the last year. Moreover, he played for England against Australia, and for Gentlemen against Players; and for some years was a notable member of the Middlesex eleven. The infectious joyousness of his nature, his sterling character, his solid, if not brilliant, intellect, and his prowess at games gave him an undisputed lead among his contemporaries. He was king of the place before he left Eton; and when he went up to Trinity, Cambridge, in 1875 he gained a similar ascendancy. Perhaps his popularity and many-sidedness militated against his academical success; at any rate he only obtained, to his chagrin, a second class in the History Tripos. He chose the law as his profession, and was called to the bar in 1881. Here his reputation stood him in good stead, and he soon obtained a considerable practice both in London and on the Oxford circuit. In 1883 he was invited to assist in chambers the then Attorney-General, Sir Henry James, and from this time his success was assured. He was appointed recorder of Hereford in 1893 and of Oxford in 1894, and in due course took silk. His first wife was the brilliant Laura Tennant, sister of Mrs. Asquith; but she died in 1886, a year after the marriage, and her little boy lived only a couple of years. He married again in 1892 Edith Sophy, daughter of Archibald Balfour, who, with a son and daughter, survived him. By family tradition and an idealistic outlook a Liberal, Alfred Lyttelton had always taken a great interest in politics; and he formed one of the party at Dalmeny, when his uncle Gladstone carried his Midlothian campaign to a successful issue in the general election of 1880. But the Home Rule departure filled him with misgivings, and he declined the offer of a safe Liberal seat in 1891. Nevertheless, so long as Gladstone was in active politics he felt he could not publicly join a party in opposition to an uncle whom he revered. After the great man's retirement he entered Parliament as a Liberal Unionist at a by-election in 1895 for Warwick and Leamington—a seat which he held till the Unionist downfall in 1906, returning, however, to the House a few months after the general election as member for St. George's, Hanover Square. It gave him great satisfaction to serve his apprenticeship to politics under the leadership of Mr. Arthur Balfour, to whom he was personally much attached. He did not at first speak very often, though he showed an active interest both in legal questions and in Chamberlain's schemes of social betterment and imperial unity. The Boer War afforded him an opportunity to show his capacity. He was appointed in 1900 chairman of a commission to inquire into the various concessions which President Kruger and the Rand had granted to companies and private individuals in the Transvaal, and to report which should be maintained and which annulled. In pursuance of the investigation he spent the autumn of 1900 in S. Africa, and he so impressed Lord Milner by his qualities that the High Commissioner hoped to secure him as his successor. It was, however, destined that his S. African experience should be utilized in another way. When Chamberlain resigned in 1903 in order to carry on his Tariff Reform campaign unhampered by office, Lyttelton was selected by Mr. Balfour, after Lord Milner's refusal, for the vacant secretaryship for the Colonies. His tenure of office lasted two years, and was marked

by the drafting of a temporary constitution which should give representative institutions to the Transvaal until such time as it should be safe to concede responsible government. This constitution was never put in force, as Sir Henry Campbell-Bannerman's Ministry determined that they would risk the grant of responsible government at once. He incurred much ill-informed odium by sanctioning the scheme of importing Chinese coolies into Johannesburg, in order to remedy the shortness of native labour and to restart the mines, and thereby the whole economic machinery of S. Africa.

After the change of government the last years of his life were spent in taking his due share in the vigorous opposition which the Unionists offered to the Liberal Education bills the budget of 1909, the Parliament bill, the Home Rule bill, and the Welsh Disestablishment bill. Of this last bill he was one of the protagonists. A man of deep religious feeling and an earnest churchman, he strongly resented a measure which was calculated, to his mind, greatly to injure the cause of religion in Wales. He was also, though he deplored the conduct of the militants, a decided supporter of woman suffrage; and he took an active interest in, and lent a helping hand to, many social movements, the Working Men's College, Toynbee Hall, the Hampstead Garden Suburb, Children's Country Holidays, the Shakespeare National Memorial, as well as to a number of miscellaneous church societies. His death came very unexpectedly, after an injury in a local cricket match. An enormous attendance at the funeral service at St. Margaret's testified to the warm place he held in the hearts of people of all classes. Mr. Asquith, then Prime Minister, spoke of him in the House of Commons as having come nearest, of all men of his generation, to that ideal of manhood to which every English father would wish to see his son aspire.

See Edith Lyttelton, *Alfred Lyttelton* (London, 1917).

(G. E. B.)

**McADOO, WILLIAM GIBBS** (1863– ), American public official, was born near Marietta, Ga., Oct. 31 1863. He entered the university of Tennessee but did not finish his course. In 1882 he became a clerk in the U.S. Circuit Court of Chattanooga, read law, and three years later was admitted to the bar. He at once began practice in Chattanooga but in 1892 removed to New York City. There he became interested in the problem of passenger transportation. As early as 1874 a tunnel under the Hudson river from Hoboken to New York had been started but abandoned because of seemingly insuperable difficulties of construction. In 1902 he formed a company which took over the abandoned tunnel and in March 1904 this tunnel was completed. Later the system was extended to connect with the Erie and Pennsylvania terminals in Jersey City, and in 1909 the tunnel under the Hudson river to downtown New York was finished. In 1912 he was vice-chairman of the Democratic National Committee and during most of the campaign was acting chairman because of the illness of Chairman McCombs. He was a strong supporter of Woodrow Wilson for president; and on the latter's election he was appointed, in 1913, Secretary of the Treasury. In this position he contributed largely to the working-out of the new Federal Reserve Banks system. He was chairman of the committee which divided the country into 12 Federal Reserve districts and selected the centres for the 12 banks; and was likewise chairman of the Federal Reserve Board which had supervision over the system inaugurated in Nov. 1914. He was also chairman *ex officio* of the Federal Farm Loan Board. In 1915 he brought about the meeting of the Pan-American Financial Congress in Washington and the organization of the International High Commission, of which he was chairman, for improving trade relations of the United States with Central and S. America. At the outbreak of the World War in Europe he favoured strict neutrality. After America's entrance into the war he was called upon to raise unprecedented sums of money. He was successful in floating four Liberty Loans between May 1917 and Oct. 1918, amounting in all to more than $16,000,000,000. He also secured the creation of a Bureau of War Risk Insurance for shipping, later extended to include life insurance for soldiers and sailors in the World War. He was the first Secretary of the Treasury to require national banks to pay interest on all Government deposits. When the railways were taken over by the Federal Government in 1917 he was appointed director-general. He favoured the League of Nations and woman suffrage, and likewise the prohibition amendment. He resigned the secretaryship of the Treasury in Dec. 1918 and the directorship of railways the following January. He then resumed the practice of law in New York City. In 1885 he was married to Miss Sarah Fleming of Chattanooga, who died in 1912. In 1914 he married Miss Eleanor Wilson, a daughter of the President.

**MACARTHUR, MARY** (1880–1921), British labour organizer, was born at Ayr Aug. 13 1880, her father being the proprietor of a drapery establishment. She was educated in Glasgow, and afterwards studied for some time in Germany. About 1901 she became interested in the Shop Assistants' Union, and her interest in this union led to her work for the improvement of women's labour conditions. She was active in furthering various strikes of women against insufficient wages, and her work for the sweated women chain-makers of Cradley Heath made her name very well known. To her the foundation of the Women's Trade Union League was chiefly due, and she was a prominent member of the National Anti-Sweating League. One of her main objects was the establishment of a minimum wage for women, and it was largely through her efforts that this principle was carried out in the Trade Boards Act of 1909. She herself became a member of the chain-making trade board. She was secretary to the Women's Trade Union League and to the National Federation of Women Workers, and was a member of the National Insurance advisory committee, while on the formation of the Central Committee on Women's Employment (1914) she became its hon. secretary. Miss Macarthur married in 1911 William C. Anderson (d. 1919), chairman of the executive committee of the Labour party, who was from 1914 to 1918 member for the Attercliffe division of Sheffield. She died at Golders Green Jan. 1 1921.

**MACBETH, ROBERT WALKER** (1848–1910), British painter, was born at Glasgow Sept. 30 1848. He studied art in the schools of the Royal Scottish Academy, and in 1871 came to London, where he was for some time on the staff of the *Graphic*. In 1874 he became an associate of the Royal Water Colour Society. Both as painter and as etcher he was very popular. He died at Golders Green Nov. 1 1910. Among his best-known works are "Dunster Castle" (1895), "The End of a Good Day" (1897) and "Naval Manœuvres" (1899).

**McBRIDE, SIR RICHARD** (1870–1917), Canadian statesman, was born at New Westminster, B.C., Dec. 15 1870 and was educated first in that city and later at Dalhousie University, Halifax, N.S. He was called to the Canadian bar in 1892, and entered the British Columbian Parliament as member for Dewdney in 1898. In 1900 he became Minister of Mines and in 1902 leader of the Opposition. In June 1903 he was returned to office as Prime Minister for the province and retained that position until 1916, when he became Agent-General for his province in London. His most notable achievement was an active railway policy fully endorsed by the electorate in Dec. 1909. He was created K.C.M.G. in 1912 and died in London Aug. 6 1917.

**M'CARTHY, JUSTIN** (1830–1912), Irish politician and writer (*see* 17.200*), died at Folkestone April 24 1912.

**MACCOLL, DUGALD SUTHERLAND** (1859– ), British art critic, was born at Glasgow in 1859. He was educated at Glasgow and later at University College, London, and Lincoln College, Oxford, where he won the Newdigate prize. He studied art at the Westminster school of art and the Slade school. He became art critic of the *Spectator* and also of the *Saturday Review*, later becoming editor of the *Architectural Review*. In 1906 he was appointed keeper of the National Gallery of British Art, and in 1911 keeper of the Wallace Collection. In 1917 he became a trustee of the National Gallery of British Art. He was prominent in the foundation of the National Art Collections Fund and the Contemporary Art Society. His published works include *Greek Vase Paintings* (1894); *Nineteenth Century Art* (1902); *The Administration of the Chantrey Bequest* (1904); and *Rhythm in English Verse, Prose and Speech* (1914).

**McCORMICK, VANCE CRISWELL** (1872– ), American politician, was born at Harrisburg, Pa., June 19 1872. He was educated at Yale (Ph.B. 1893). In 1900 he became a member of the city council of Harrisburg, and from 1902 to 1905 was mayor. In 1914 he was an unsuccessful candidate for governor of Pennsylvania. He was active in promoting President Wilson's reëlection in 1916 and was that year chairman of the National Democratic Campaign Committee. From 1917 to 1919 he was chairman of the War Trade Board which supervised exports to neutral countries, after the entry of America into the World War. Soon after his appointment he visited England and France on a war mission. In Dec. 1918 he was invited to join President Wilson in Paris as adviser, and was a member of the American Commission to Negotiate Peace the following year. In Feb. 1919 he was appointed a member of the Supreme Allied Blockade Council and the Economic Council. Before his appointment as chairman of the National Democratic Committee in 1916 he was a director of the Federal Reserve Board.

**MACCUNN, HAMISH** (1868–1916), Scottish composer (*see* 17.209), died in London Aug. 2 1916.

**MACDONALD, JAMES RAMSAY** (1866– ), British politician, was born at Lossiemouth, and educated at a board school. He early threw himself into the Socialist movement, and became before long, as organizer and writer, an important personality

** These figures indicate the volume and page number of the previous article.*

in it. He was appointed secretary of the Labour party in 1900 and held the position for 11 years; and editor of the "Socialist Library" in 1905. He naturally turned to public life, and served on the London County Council from 1901 to 1904.

In 1906 he was elected to Parliament as Labour member for Leicester, and held the seat for a dozen years. It was as chairman of the Independent Labour party—the section led by Mr. Keir Hardie—that he entered the House of Commons; and he explained at the congress of the party in April 1907 that its object was to mould society into the socialist State. He adapted himself early to parliamentary conditions. One of the points which he constantly pressed, with eventual success, was that the terms of Government employment should be as good as those offered by the best private firms. In the controversy with the House of Lords he openly proclaimed himself a Single-Chamber man. On the National Insurance bill in 1911 he pointed out that a fundamental change of opinion had taken place, both parties now accepting the principle that social welfare was the care of the State. In that year he became the chairman of the Labour party in Parliament. He brought the whole weight of his party to bear in favour, first of the Parliament bill, and afterwards of the Home Rule bill. But he was suspicious of Sir Edward Grey's foreign policy, which he thought too slavish in its following of Lord Lansdowne; and he opposed the naval increases of the years before the World War, as the socialists in Berlin had opposed the German increases which provoked British rejoinders.

His devotion, indeed, to the ideal of international socialism caused him, at the outbreak of the World War, to lose touch not only with British public feeling in general, but even with the sentiment of the Labour party which he led. In response to Sir Edward Grey's statement in the House of Commons on Aug. 3 1914, he contended that no proof had been given that the country was in danger; that the conflict could not be confined to the neutrality of Belgium; that the action of Russia was suspicious; that France could not be annihilated; and that, in consequence, Great Britain should remain neutral. He found, however, that the bulk of the Labour party were convinced by the words of Sir Edward Grey and by the action of Germany; and he resigned the leadership of his party, being succeeded by Mr. Arthur Henderson. He remained a pacifist throughout the war, and used his influence in this direction in the labour and socialist movement, but he seldom spoke in Parliament, though he associated himself with the occasional anti-war demonstrations of Mr. Snowden and Mr. Arthur Ponsonby, and claimed the right of public meeting and free speech for pacifists. He endeavoured unsuccessfully to prevent the Labour Conference in Jan. 1916, at the time of the first Military Service bill, from pledging themselves to support the Government in the prosecution of the war; but he declared at the same time, to the general surprise, that he and his friends were the most bitterly anti-German section of the people. He was active in the summer of 1917 in promoting the participation of representatives of the English Labour and Socialist parties in an International Socialist Conference at Stockholm, to which German representatives were coming, and he went to Paris with Mr. Arthur Henderson on a fruitless mission to secure the coöperation of French and Belgian socialists. He himself did not get to Stockholm, as the Sailors' and Firemen's Union, whose distrust of Germany was based on practical knowledge of her crimes at sea, refused to permit him to sail. His record as a pacifist cost him his seat at Leicester at the general election of Dec. 1918; he received only 6,347 votes to the 20,570 polled for his opponent, Mr. J. F. Green, a leading member of the National Democratic party.

Mr. Macdonald published several works on socialism and labour, besides a couple of books on India, which he visited in 1913 as a member of the Public Services Commission. He also wrote a memoir of his wife, Margaret Ethel, daughter of the eminent chemist, Dr. J. H. Gladstone, a woman of much character and ability, who died in 1911, leaving two sons and three daughters.

**MACDONALD, SIR JOHN HAY ATHOLE** (1836–1919), British lawyer and judge, was born at Edinburgh Dec. 27 1836. He was educated at Edinburgh and at Basel University, was called to the Scottish bar in 1859, and rapidly made his name as an advocate. From 1874 to 1876 he was sheriff for the counties of Ross, Cromarty and Sutherland, and from 1876 to 1880 solicitor-general for Scotland. In 1880 he became a Q.C. and sheriff of Perth, and from 1882 to 1885 was dean of the Faculty of Advocates. In 1885 he successfully contested Edinburgh and St. Andrew's universities in the Conservative interest, and was appointed lord-advocate by Lord Salisbury's Government, resuming this office when the Conservatives returned to power in 1886. In 1888 he became lord justice clerk of Scotland and president of the second division of the Court of Session, with the courtesy title of Lord Kingsburgh, retiring in 1915. He was made K.C.B. in 1900 and G.C.B. in 1916. He died at Edinburgh May 9 1919. Macdonald was all his life a strong supporter of the volunteer movement, for which he did much valuable work. He published various books on the subject, the most important being *Fifty Years of It* (1909).

**MACDONELL, SIR JOHN** (1846–1921), British jurist, was born at Brechin, Forfarshire, Aug. 11 1846, and was educated at the universities of Aberdeen and Edinburgh. He was called to the bar at the Middle Temple in 1873 and for some years was counsel to the Board of Trade and the London Chamber of Commerce. In 1889 he was made a Master of the Supreme Court and in 1912 was appointed King's Remembrancer. His knowledge of the science of law, both ancient and modern, was wide and exhaustive. He was Quain professor of comparative law in the university of London (1901), president of the Society of Public Teachers of Law (1912–3), a member of several royal commissions and editor for many years of the *Journal of Comparative Legislation and International Law*. In 1913 he was elected a fellow of the British Academy and in 1914 was created K.C.B. Besides editing the *State Trials* (1887), *The Civil Judicial Statistics* (from 1894), the *Criminal Judicial Statistics* (from 1900) and *Smith's Mercantile Law*, he published works on the subject of capture at sea and the law of master and servant, and was the author of many papers on questions of international law. He was also for 40 years an influential leader-writer for *The Times*. He died in London March 17 1921.

**MACH, ERNST** (1838–1916), Austrian physicist and psychologist (*see* 17.232), died in 1916.

**MACHINE-GUN** (*see* 17.237).—Prior to 1910 the standard machine-guns of all nations were comparatively heavy and unwieldy. The principal types in use were the Maxim and the Hotchkiss, each of which weighed about 75 lb.; and, as they were mounted on tripods of about the same weight, the combined weight of the gun and tripod was approximately 150 pounds. The bulky nature of these machine-guns was a serious handicap to their usefulness, and the efforts of the inventors and designers reflected a universal desire for a lighter automatic weapon.

*The Benèt-Mercié.*—The desire for a lighter gun was met in France by the production of a portable automatic weapon designed by the Hotchkiss Company. This gun, which is known in Europe as the Portable Hotchkiss, and in America as the Benèt-Mercié, weighs less than 30 lb. complete. It has no tripod but is supported at the muzzle by a pair of light folding legs and at the breech by an adjustable rest which telescopes into the butt-stock. By means of these attachments the rifle is rested at the proper height for firing from the prone position. The gun resembles the heavy Hotchkiss in mechanism, and, like it, is air-cooled and fed by metallic feed strips or charger bands holding 30 shots each. Following the developments of the World War, this weapon would be classed, not as a machine-gun, but as a machine-rifle, a type which has its own sphere of usefulness, but which cannot fulfil the rôle of the machine-gun in modern tactics.

However, at the time when this weapon was first introduced, the art of machine-gun design and manufacture had not advanced to the point where the production of a diversity of different types forced a tactical division of automatic weapons according to weight and fire capacity. Consequently, the gun entered tests as the competitor of heavy-type machine-guns. After extensive trials it was adopted by the United States in 1909 as the service machine-gun, succeeding the Maxim, which had been adopted in 1904. The several hundred Maxims on hand were, however, continued in service. After its adoption by the United States the Portable Hotchkiss was tried in Great Britain, and a number were purchased for cavalry use. The British also used this gun with great success for the arming of tanks during the World War.

*The Vickers Machine-Gun.*—A more conservative effort toward the reduction of weight resulted in the production of the Vickers light machine-gun (afterwards called the Vickers machine-gun) by Vickers, Ltd., in 1910. The mechanism of this gun is essentially the same as that of the Maxim, formerly produced by the same company, but the gun is considerably smaller, and the weight has been reduced by one-half. This reduction in size and weight was accomplished without sacrifice, for the Vickers is superior to the old Maxim not only in portability and ease of concealment but also in durability and reliability, while its volume of fire and steadiness of mounting are the same. The weight of the gun is 38 lb., and that of the tripod is 35 pounds. The gun has a corrugated steel water-jacket holding 7½ pt., and is fed from a belt holding 250 rounds of ammunition. The Vickers gun became the standard of the British army, and, after a series of trials, it was adopted by the United States in 1915 to supersede the Benèt-Mercié as the service gun. It was also adopted by the Russians. During the World War the bulk of the machine-guns in the British army were of the Vickers type, and many thousands of Vickers guns were used by the American troops.

*The Lewis Gun.*—The outbreak of the war in 1914 forced upon Great Britain the necessity of rapidly supplementing the small stock of machine-guns then on hand. In this emergency a portable air-cooled machine-rifle, invented by Col. I. N. Lewis, a retired officer of the U.S. army, was adopted and manufactured in quantity. In size and weight the Lewis gun resembles the Benèt-Mercié and, like it, is gas-operated; but it differs in the methods of feeding and cooling. The cartridges are fed to the gun in flat disc-shaped magazines, each holding 47 rounds. The characteristic method of cooling employed on this gun is known as the positive air-cooling system. There is an aluminium radiator surrounding the barrel, and encased in a sheet-metal jacket which extends beyond the muzzle of the gun and is open at both ends. During the firing of the piece, the blast of gases from the muzzle induces a draft of air through the radiator casing. This rapidly moving column of air passes over fins on the aluminium radiator and cools the gun almost as effectively as a water-jacket would. As the war progressed, the Lewis guns became extremely popular, and were used in a very effective manner. Owing to their portability and the absence of such encumbrances as tripods and water-supply, it became possible to use them for direct fire in the most advanced positions. However, it was soon recognized that their limited fire capacity and lack of a steady mount rendered them unsuitable for overhead supporting fire, indirect fire, and barrage work, all of which functions were fulfilled admirably by the Vickers guns from positions farther in the rear.

*American Controversy.*—In 1916 the United States, which had become involved in a threatening situation on the Mexican border, experienced a shortage of machine-guns. None of the Vickers guns under manufacture had been delivered, so, in order to meet the immediate need for guns on the border, several hundred Lewis guns, chambered for the British cartridge, were purchased, together with a supply of ammunition. About this time Congress made an appropriation of $12,000,000 for the purchase of machine-guns. Immediately afterwards a sharp controversy arose as to the relative merits of the Lewis machine-gun and of the service automatic weapons (Benèt-Mercié and Vickers). To settle this controversy the Secretary of War appointed a board, consisting partly of army and navy officials of high rank and partly of civilians, to go deeply into the subject of the proper machine-gun policy. After extended sittings this board rendered a report which for the first time in the United States called attention to a fact which the machine-gun tactics developed in the British army during two years of war should have rendered plainly apparent long before. This was the fact that the heavy machine-gun and the light machine-gun or machine-rifle (Lewis gun) were not interchangeable in function, and that a certain proportion of each type should be supplied. The board defined the two types under consideration as (1) *heavy type*, relatively heavy, with substantive tripod mount, effectively cooled for continuous fire, fed from a belt; and (2) *light type*, comparatively light weight, highly portable, without tripod mount, air-cooled, fed from a magazine. The board recommended that the relative proportion of these weapons to be purchased should be two of the light type to one of the heavy. It also reported that the Vickers machine-gun "fulfilled to a high degree the requirements of the service for a machine-rifle of the heavy type. The board is not able at this time to recommend a machine-rifle that will fulfil the requirements of the military for a machine-rifle of the light type." The board recommended the immediate purchase of 4,600 Vickers machine-guns, and made recommendations for a test to be held in May 1917. A notice was published giving the date of the proposed test and inviting manufacturers and inventors to submit weapons for trial. Just before the date set for the test the United States declared war on Germany, and, as a result, emergency orders were placed for a large quantity of Lewis guns, and for several thousand Colt guns made by the Marlin-Rockwell Co. who were building these guns in large quantities for Russia. In May 1917 the Machine-Gun Board held the official test that had been advertised some months before. The Vickers and Lewis guns proved efficient, but the most marked superiority was shown by a new gun introduced by Mr. John M. Browning, the inventor of the Colt machine-gun and of many rifles and automatic pistols. The standard endurance test was the firing of 20,000 rounds. Mr. Browning fired this test without stopping to clean his gun, and with so little trouble that he was ordered to continue firing until some trouble developed. The gun fired over 39,000 rounds before the first breakage occurred. In order to verify this phenomenal performance, the inventor was required to fire a duplicate gun, which completed the 20,000-round test in 48 minutes and 12 seconds with only three stoppages, all of which were due to defective ammunition. In size, weight, and general appearance the Browning gun resembles the Vickers, but it has an entirely different mechanism. An examination of the mechanical construction of this gun revealed a remarkable simplicity from a manufacturing point of view. This gun showed such promise that, before proceeding with the trials of the remaining weapons before it, the Board rendered a preliminary report recommending that the manufacture of the Browning gun in quantities be undertaken at once. The recommendations of the Board were followed, and several large arms factories were started on the task of producing the new gun in the shortest possible time. Thanks to the simplicity of the design, the manufacturers who were entrusted with the task of producing Browning guns were enabled to turn out enormous quantities of them during the war.

*The Browning Automatic Rifle.*—After the test of his heavy machine-gun Mr. Browning submitted a weapon weighing only 15 lb., but at the same time capable of automatic fire from detachable magazines holding either 20 or 40 rounds. This rifle passed a highly successful test and was ordered adopted. It was at once recognized that this was a new and distinct type of gun, as its fire-power was nearly equal to that of the machine-rifle type (Lewis and Benèt-Mercié), while its weight was but little more than half as great, a fact which enabled it to be fired from the shoulder or hip with ease. The success of this weapon led to the immediate elimination of the intermediate type from the armament of the ground forces of the United States, and the assignment of the Lewis guns to the air service, to be stripped and mounted on aeroplanes as flexible guns.

As a result of the introduction of the light Browning machine-rifle, as it was at first called, and of the Chauchat, a gun somewhat similar in general type introduced by the French, it became desirable to adopt terms to define more clearly the different classes of automatic weapons. In order to accomplish this purpose, an order was issued by the War Department assigning to the heavy type of automatic weapon the designation "machine-gun"; to the intermediate type (Lewis, Benèt-Mercié), the designation "machine-rifle"; and to the light type (Browning, etc.), the term "automatic rifle." The term "semi-automatic rifle" was assigned to self-loading weapons weighing 10 lb. or less, designed to take the place of the magazine-rifle. During the remainder of this article the terminology given will be adhered to, and as the lighter weapons are separately described in the article on RIFLES AND LIGHT MACHINE-GUNS—the machine-gun only will be considered here.

*Aircraft Machine-Gun.*—Early in the World War, the application of machine-guns to aircraft began by the improvised mounting of the regular ground-type guns on aeroplanes. Soon, however, the increasing use of machine-guns in aerial warfare developed two standard systems of mounting guns in aircraft. According to the method of mounting them, aircraft guns are either "flexible" or "fixed." In flexible mountings the guns are pivoted so that they may be freely swung or pointed in any direction by the gunner. Flexible guns are usually mounted in the rear cockpit, but in some large bombing airplanes they have been mounted in the nose, or in the fuselage to shoot through a shutter in the bottom. The standard flexible gun in the Allied services was the Lewis, which, for aircraft use, was stripped of the cooling system and was fitted with magazines of extra capacity holding 97 shots. These guns were frequently mounted in pairs, with the idea of shooting both guns at once and thus increasing the volume of fire. "Fixed" aeroplane guns are usually mounted either above or beside the engine, and are permanently pointed in one direction, which is straight ahead. Consequently, in order to aim the guns, it is necessary to turn the whole aeroplane so that it is pointing at the enemy. For this reason these guns are operated by the pilot. Because the guns fire straight ahead, it is necessary for them to shoot through the arc swept by the propeller blades. In order to avoid damage to the propeller, fixed guns are synchronized so that the shots go between the blades. This synchronization is accomplished by having the trigger of the gun operated from a cam on the engine shaft. This cam and the firing mechanism, which it operates, are so timed that the gun will be fired only when the propeller blades are in such a position that the shots will not strike them. The firing mechanism is so arranged that it is inoperative except when it is thrown into gear by a lever situated for convenient manipulation by the pilot. Synchronized guns are generally of the type fed by a belt. Those used by the Americans and the British usually employ link belts instead of woven fabric belts. The metallic links are pinned together by the cartridges themselves, and as the cartridges are pulled out of the belt in being fed through the gun the belt disintegrates into a series of separate links. This avoids the complications and dangers incident to the use in aircraft guns of fabric belts which have to be reeled up as they leave the gun in order to avoid having them trailing in the wind and perhaps flying into the pilot's face or interfering with the controls. Owing to the fact that the fleeting opportunities of

aerial combat do not allow many shots to be fired at a time, aircraft guns do not suffer from overheating as ground guns do. In addition, the rush of the aeroplane through the atmosphere is very effective in cooling the guns. For this reason no cooling devices are employed in aircraft guns. In the case of the Lewis guns the radiators are removed; and when the Vickers or other water-jacketed guns are used the water-jackets are cut open to allow a free circulation of air and to reduce weight. On account of the very high speed of modern aeroplanes, the relative motion of passing machines is great enough to leave a very large interval between machine-gun bullets fired from one aeroplane at another. In order to reduce this interval and increase the chances of a hit, most aircraft machine-guns are arranged to work at a higher rate of fire than ground guns are. The Browning aircraft gun fires over 1,000 shots per minute.

*Large-Calibre Machine-Guns.*—The desire for an increased incendiary effect against balloons led to the adoption by the Allied armies of aircraft machine-guns of a larger calibre than that of the standard service cartridge. The first guns of this type were Vickers guns chambered for the old 11-mm. (·44 in.) French cartridge. These cartridges were loaded with a tracer bullet in which the burning of the tracer composition was sufficiently intense to give an incendiary effect on impact with a balloon. A large number of the 11-mm. Vickers guns were used, but, owing to the fact that the velocity of the cartridge was low (1,300 f. s.), a more powerful cartridge of about this calibre was considered desirable. The result was that large-calibre (·45 to ·50 in.) machine-guns, intended to give a velocity of about 2,500 f. s., were designed in both America and Great Britain during the latter stages of the World War. These designs, however, were not completed in time for any of the guns to be placed in service before the Armistice.

*Tank Machine-Guns.*—The introduction of the tank as a weapon of warfare was followed by the adoption of the machine-gun as part of its armament. This use of the machine-gun, like its use on aircraft, is so different from its normal employment as to call for a special type of gun or for a special adaptation of existing types. By virtue of its heavy armour protection, the tank can approach very close to hostile positions, and is consequently the target of an extreme concentration of rifle and machine-gun fire. For this reason, water-cooled machine-guns are unsuitable for the armament of tanks, because the water-jacket, which must necessarily project out through the armour, would soon be riddled. For the same reason it is desirable to have for a tank machine-gun a weapon with a barrel heavy enough to withstand rifle fire. For this purpose the French used the Hotchkiss, and the British used the portable Hotchkiss, or Benèt-Mercié, which was admirably suited for this use. The first tanks built in America were armed with the Marlin tank-gun, which was the Marlin aircraft-gun with an aluminium radiator added. Later a special Browning-type gun was designed for use in tanks. This weapon, which is called the Browning tank-gun, is similar in its mechanism to the Browning machine-gun, with the difference that the water-jacket is omitted and the barrel is made very heavy, and is only 18 in. long instead of 24. There is a special latch provided on this gun to hold the mechanism open when the gun is not firing, and thus prevent the heat of the barrel from exploding the cartridge.

FIG. 1.—U.S. Army Tripod.

*Machine-Gun Mountings.*—The universal method of firing ground-type machine-guns is from a tripod, which allows the gun either to be controlled for elevation by means of handwheels and clamps or to be swung free. The British Mark IV. tripod is an excellent example (*see* 17.286). This very simple and rugged device remained standard in the British army during the World War, and was used extensively by the American army. The three legs are each adjustable by means of clamps which allow their relative positions to be changed to compensate for inequalities of the ground, or to alter the height of the gun. Changes in elevation are obtained by means of an elevating screw and hand-wheel. There is a friction clamp for deflection. Small changes in azimuth are obtained by setting up the deflection clamp lightly, and then "tapping" the gun with the hand on one side or the other until the proper direction is obtained. It will be noted that by throwing off the deflection clamp this gun can be swung freely from side to side, which is important in meeting a rush at close quarters, but there is no hand-wheel or other device for setting off a given deflection from a known direction, which is often very

FIG. 2.—German Machine-Gun Mounting.

desirable in indirect fire. It will also be noted that there is no satisfactory way of allowing the gun to be swung freely in elevation, which is important in shooting at aircraft. When this becomes necessary, the elevation pin must be pulled out, and the gun must be reversed in its cradle. These disadvantages have been overcome, though at the expense of a considerable amount of mechanical complication, in the U.S. army tripods, models of 1917 and of 1918 (*see* fig. 1), which have a slow-motion hand-wheel and index, and a throw-off for both elevation and deflection. These devices allow the gunner to make adjustments of known amounts in indirect fire, or to swing the gun freely in any direction when this becomes desirable. The French tripods have a hand-wheel for elevating, and a clamp for traversing. The elevating screw is attached to the gun by a snap-

FIG. 3.—Vickers Machine-Gun.

catch which can be quickly released to allow free elevation. Stops, which can be set to limit the traverse to any desired amount, are provided. The legs are provided with a quick adjustment to allow the use of either a high or low gun position. The Germans used tripods to some extent, but placed their main reliance on a distinctive style of mount which can best be described by referring to the illustration (fig. 2). This device provides both for mounting the gun and for transporting it. The gun is fastened into the mount by means of trunnions on the water-jacket, which fit into gimbals so that the gun may be pointed in any direction. There is a slow-motion hand-wheel for elevating the gun, and a throw-off which allows it to be swung free. The deflection is controlled by means of a friction clamp. The mount is hinged in the middle so as to be adjustable for height. When it is desired to transport the gun, the

mount is placed in its lowest position, so that it forms a litter with the front and rear legs projecting for handles; or the front legs may be hinged back to the rear, when the mount becomes a sledge which may be dragged by means of cords hooked into rings provided for this purpose.

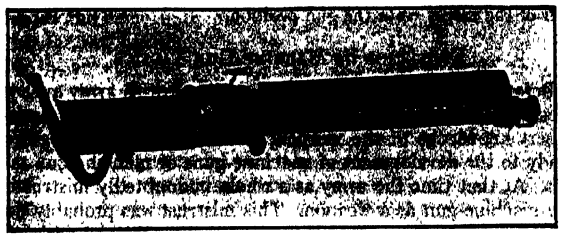

FIG. 4.—Vickers Machine-Gun.

*Transportation of Machine-Guns.*—The standard method of transporting machine-guns and their equipment is by means of animal-drawn transportation. For this purpose the British use limbered wagons drawn by horses. The French use small carts or *voiturettes*, which are drawn by one horse or dragged by men. Before the World War, pack outfits were the only transportation used for machine-guns by the United States. During the World War, the one-mule cart, patterned after the French design, became standard for the transportation of both machine-guns and their ammunition, though motor transportation was provided in the case of special machine-gun battalions.

*The Vickers Machine-Gun.*—The Vickers machine-gun is a Maxim greatly lightened, and slightly changed as to details of the mechanism. The description of the operation of the Maxim will serve equally for the Vickers. The weight of the gun is 38 lb., including 7½ pt. of water in the jacket. The ammunition belt used is the same as for the Maxim. When the gun is used in aircraft, metallic link belts are employed.

FIG. 5.—Browning Machine-Gun.

*The Browning Machine-Gun.*—In this gun, as in the Vickers, the actuating force is the recoil of the barrel. The principal parts in the mechanism are the barrel, which is mounted in a water-jacket and arranged to have a sliding motion; a heavy rectangular breech-block, or bolt; a strong piece screwed on to the barrel, called the barrel extension, on which the bolt slides; a vertical lock in the barrel extension, for locking the bolt against the rearward thrust of the explosion; a short curved lever, called the accelerator, for utilizing the recoiling energy of the barrel for throwing the bolt rapidly to the rear; a firing pin and trigger mechanism; a belt-feeding mechanism; and the necessary springs and small parts. The parts are enclosed in a rectangular breech casing consisting of side, top, and bottom plates riveted together, with a hinged cover and a sliding back plate. The relations of these parts in both the forward and rearward positions can be seen in the illustration. When the trigger is pulled, its forward end draws the sear downward, thus releasing the firing pin, which flies forward and primes the cartridge. The force of the explosion causes the barrel to recoil sharply to the rear, carrying with it the barrel extension and the bolt. During the backward motion, the projecting end of the breech-lock pin strikes against cams on the forward extension of the lock frame. These cams force the breech lock down, thus unlocking the bolt from the barrel extension. At this instant the rear end of the barrel extension in its backward motion comes into contact with the curved face of the accelerator. The pressure of the barrel extension on the accelerator causes it to rotate so that its point, which is in contact with a lip

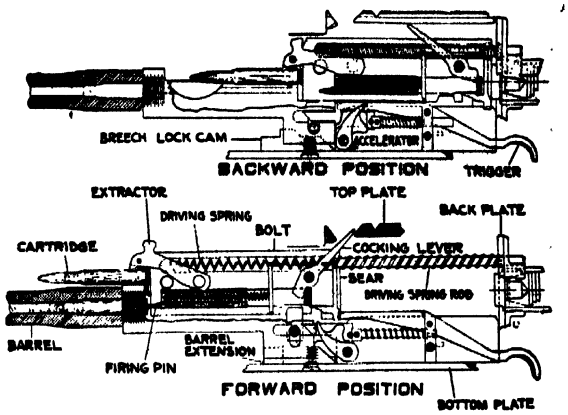

FIG. 6.—Browning Machine-Gun.

on the breech block, swings away from the barrel. As the accelerator rolls over, the curve on its face causes the point of contact with the barrel extension to move closer to its pivot, which is the fulcrum of its motion. This produces a rapid acceleration of the motion of the bolt, with a corresponding increase of resistance to the rearward motion of the barrel. The result is that the sharp backward motion of the barrel is checked, and its momentum is transferred to the bolt, which is thrown to the rear of the breech casing. During the backward motion of the bolt the firing pin is cocked by the cocking lever, and a live round is drawn from the belt by the extractor and forced downward into guideways in the face of the bolt by means of a cam in the cover plate which acts on the top of the extractor. After the backward motion of the bolt is completed, the driving spring pushes it forward. During the forward motion of the bolt a cam in its upper surface acts through a lever to feed the belt along so that a fresh cartridge is in place. At the same time a spring stud in the side of the extractor engages in a cam groove cut in the side plate. This cam first lowers the extractor, so as to bring the cartridge in line with the chamber. After the cartridge is partly into the chamber, the cam raises the extractor into a position to grasp the fresh cartridge that is in the feedway. Just before the bolt completes its forward motion the lip on its under side strikes the tip of the accelerator and rotates it forward. This motion of the accelerator, acting through the barrel extension, forces the barrel forward. At the end of this movement, the breech lock is carried up the inclined face of the breech-lock cam, which causes the breech lock to rise and engage in its slot in the bolt, thus locking the bolt and barrel extension together. After the locking is completed, the further motion of the bolt brings the inclined faces on the sear into engagement with the corresponding surfaces on the trigger; and if the trigger is being held down the action of these surfaces forces the sear down, releasing the firing pin and causing the cycle to be repeated. This gun, when supplied to infantry, uses woven cartridge belts holding 250 rounds each. An excellent feature of this belt is its cheapness and ease of manufacture. It consists simply of a narrow strip of cotton tape with cartridge pockets woven in it. There are no metallic components to make the belt expensive or render its manufacture difficult. A belt-filling machine is furnished for loading cartridges rapidly into the belts. The weight of the Browning machine-gun, with 7 pt. of water in the jacket, is 37 lb. The tripod weighs 45 lb. The rate of fire is about 500 rounds per minute. In the Browning aircraft machine-gun the water-jacket is replaced by a light ventilated barrel casing, and a trigger mechanism capable of being operated by a synchronizing device is substituted for the regular trigger and sear. In order to cause the gun to operate at a higher speed, the breech block is greatly lightened. The gun fires at a speed of about 1,100 shots per minute. This gun uses disintegrating belts formed of metallic links.

*The Marlin Aircraft Machine-Gun.*—This gun is a development of the Colt machine-gun (*see* 17.244). It is greatly lightened to fit it for use in the air, and a reciprocating piston operating in a gas cylinder under the barrel is substituted for the swinging gas lever used in the Colt gun. Except for minor changes, the breech action of this gun is the same as that of the Colt. A special firing mechanism and trigger motor is fitted to allow the gun to be fired through the propeller by either a mechanical or a hydraulic synchronising gear. This gun uses the same disintegrating metallic belt as is furnished for the Browning. The gun weighs 23½ lb., and fires at the rate of about 680 shots per minute.

*The Lewis Aircraft Machine-Gun.*—The mechanism of this gun is the same as that of the Lewis machine-rifle, described in the article

aerial combat do not allow many shots to be fired at a time, aircraft guns do not suffer from overheating as ground guns do. In addition, the rush of the aeroplane through the atmosphere is very effective in cooling the guns. For this reason no cooling devices are employed in aircraft guns. In the case of the Lewis guns the radiators are removed; and when the Vickers or other water-jacketed guns are used the water-jackets are cut open to allow a free circulation of air and to reduce weight. On account of the very high speed of modern aeroplanes, the relative motion of passing machines is great enough to leave a very large interval between machine-gun bullets fired from one aeroplane at another. In order to reduce this interval and increase the chances of a hit, most aircraft machine-guns are arranged to work at a higher rate of fire than ground guns are. The Browning aircraft gun fires over 1,000 shots per minute.

*Large-Calibre Machine-Guns.*—The desire for an increased incendiary effect against balloons led to the adoption by the Allied armies of aircraft machine-guns of a larger calibre than that of the standard service cartridge. The first guns of this type were Vickers guns chambered for the old 11-mm. (·44 in.) French cartridge. These cartridges were loaded with a tracer bullet in which the burning of the tracer composition was sufficiently intense to give an incendiary effect on impact with a balloon. A large number of the 11-mm. Vickers guns were used, but, owing to the fact that the velocity of the cartridge was low (1,300 f. s.), a more powerful cartridge of about this calibre was considered desirable. The result was that large-calibre (·45 to ·50 in.) machine-guns, intended to give a velocity of about 2,500 f. s., were designed in both America and Great Britain during the latter stages of the World War. These designs, however, were not completed in time for any of the guns to be placed in service before the Armistice.

*Tank Machine-Guns.*—The introduction of the tank as a weapon of warfare was followed by the adoption of the machine-gun as part of its armament. This use of the machine-gun, like its use on aircraft, is so different from its normal employment as to call for a special type of gun or for a special adaptation of existing types. By virtue of its heavy armour protection, the tank can approach very close to hostile positions, and is consequently the target of an extreme concentration of rifle and machine-gun fire. For this reason, water-cooled machine-guns are unsuitable for the armament of tanks, because the water-jacket, which must necessarily project out through the armour, would soon be riddled. For the same reason it is desirable to have for a tank machine-gun a weapon with a barrel heavy enough to withstand rifle fire. For this purpose the French used the Hotchkiss, and the British used the portable Hotchkiss, or Benèt-Mercié, which was admirably suited for this use. The first tanks built in America were armed with the Marlin tank-gun, which was the Marlin aircraft-gun with an aluminium radiator added. Later a special Browning-type gun was designed for use in tanks. This weapon, which is called the Browning tank-gun, is similar in its mechanism to the Browning machine-gun, with the difference that the water-jacket is omitted and the barrel is made very heavy, and is only 18 in. long instead of 24. There is a special latch provided on this gun to hold the mechanism open when the gun is not firing, and thus prevent the heat of the barrel from exploding the cartridge.

FIG. 1.—U.S. Army Tripod.

*Machine-Gun Mountings.*—The universal method of firing ground-type machine-guns is from a tripod, which allows the gun either to be controlled for elevation by means of handwheels and clamps or to be swung free. The British Mark IV. tripod is an excellent example (*see* 17.286). This very simple and rugged device remained standard in the British army during the World War, and was used extensively by the American army. The three legs are each adjustable by means of clamps which allow their relative positions to be changed to compensate for inequalities of the ground, or to alter the height of the gun. Changes in elevation are obtained by means of an elevating screw and hand-wheel. There is a friction clamp for deflection. Small changes in azimuth are obtained by setting up the deflection clamp lightly, and then "tapping" the gun with the hand on one side or the other until the proper direction is obtained. It will be noted that by throwing off the deflection clamp this gun can be swung freely from side to side, which is important in meeting a rush at close quarters, but there is no hand-wheel or other device for setting off a given deflection from a known direction, which is often very

FIG. 2.—German Machine-Gun Mounting.

desirable in indirect fire. It will also be noted that there is no satisfactory way of allowing the gun to be swung freely in elevation, which is important in shooting at aircraft. When this becomes necessary, the elevation pin must be pulled out, and the gun must be reversed in its cradle. These disadvantages have been overcome, though at the expense of a considerable amount of mechanical complication, in the U.S. army tripods, models of 1917 and of 1918 (*see* fig. 1), which have a slow-motion hand-wheel and index, and a throw-off for both elevation and deflection. These devices allow the gunner to make adjustments of known amounts in indirect fire, or to swing the gun freely in any direction when this becomes desirable. The French tripods have a hand-wheel for elevating, and a clamp for traversing. The elevating screw is attached to the gun by a snap-

FIG. 3.—Vickers Machine-Gun.

catch which can be quickly released to allow free elevation. Stops, which can be set to limit the traverse to any desired amount, are provided. The legs are provided with a quick adjustment to allow the use of either a high or low gun position. The Germans used tripods to some extent, but placed their main reliance on a distinctive style of mount which can best be described by referring to the illustration (fig. 2). This device provides both for mounting the gun and for transporting it. The gun is fastened into the mount by means of trunnions on the water-jacket, which fit into gimbals so that the gun may be pointed in any direction. There is a slow-motion hand-wheel for elevating the gun, and a throw-off which allows it to be swung free. The deflection is controlled by means of a friction clamp. The mount is hinged in the middle so as to be adjustable for height. When it is desired to transport the gun, the

Early in 1915 the Lewis gun was first issued to battalions in the field, and at the same time the ·303-in. Vickers machine-gun was issued to infantry machine-gun sections and entirely superseded the Maxim gun. At this time, therefore, the two weapons (*i.e.* the Vickers and Lewis guns) were used side by side in the same unit, but little or no difference was made in their tactical handling.

It is an accepted principle that the tactical handling of a weapon must be based on its characteristics, and it is necessary to state briefly what is the difference between the characteristics of the so-called "light" machine-guns, such as the Lewis and the Hotchkiss guns, and the "heavy" machine-gun, *i.e.* the Vickers gun in the British service, the modified Maxim in the German and others, and the Browning Heavy in the U.S. army.

Owing to the fact that it is not fired from a stable mounting, the Lewis gun cannot carry out overhead fire with safety and is not adapted for indirect fire. Being an air-cooled weapon it is not capable of sustained fire action and is limited to short bursts of fire. It is sufficiently light and portable to accompany and keep pace with the leading infantry. In the World War, functions similar to those which came to be allotted to the Lewis gun were performed by the Chauchat and others in the French army; by the Chauchat and, later, the Browning Light in the American; and by a somewhat lightened (finally an air-cooled) pattern of the Maxim in the German army. Their characteristics are dealt with under RIFLES AND LIGHT MACHINE-GUNS.

The Vickers gun is fired from a stable (tripod) mounting; it is therefore capable of overhead and indirect fire with safety to one's own troops. Being a water-cooled gun it is capable of sustained fire action subject only to considerations of ammunition supply. Neither the gun nor the mounting is sufficiently light to enable machine-gunners when man-handling their loads to accompany and keep pace with infantry in a rapid advance. It is evident that the tactical handling of two weapons having such widely different characteristics cannot be the same if the best possible value is to be obtained from each weapon.

At the outbreak of the World War the higher command of the British army did not appear to have realized the characteristic difference between the various types of automatic small arms in use (Vickers, Maxim, Lewis and Colt guns): all were classified under the general heading of "machine-guns." This lack of discrimination between the characteristics and consequently between the true tactical rôles of the weapons undoubtedly retarded the development of machine-gun tactics for upwards of two years. In the autumn of 1915, however, partly owing to the very considerable increase in the output of Vickers guns and partly to a realization of the need for differentiation in methods of tactical handling, it was determined to form brigade machine-gun companies, armed with Vickers guns, to be separate from and independent of battalion machine-gun sections, the latter to be armed with Lewis guns. It was evident that the personnel to man these companies could not be found from and maintained by the infantry, and it was therefore decided to form "a corps of machine-gunners." The large increase in machine-gun resources, and the decision to form machine-gun companies, led to the issue, in Oct. 1915, of a Royal Warrant for the formation of the Machine-Gun Corps, to be divided into three branches—cavalry, infantry and motors. The machine-gun company comprised a headquarters and four sections, each of four guns. Unfortunately, the original establishment of these companies was fixed at a very low figure, only four men per gun being allowed for in the section; and this low establishment seriously militated against the efficiency of the companies when they took the field. It was finally decided that the Machine-Gun Corps should be armed solely with the Vickers gun and that the personnel should be trained in its use alone.

The year 1915 saw no change of doctrine in the British army at large as to the tactical handling of the Vickers gun. Nevertheless, by the end of that year there existed a small body of officers who had had experience of handling the gun in the field, and who saw the possibilities of development in machine-gun tactics if overhead and indirect fire were put into practice. These officers used every endeavour to prove the need for and practicability of these methods of fire tactics, but a considerable time elapsed before general recognition was afforded to the principles they advocated. In March 1916 it was decided that, as additional Vickers guns and personnel became available, a fourth machine-gun company per division should be formed, this company to be known as the divisional machine-gun company and to be at the disposal of the divisional commander, whilst the brigade machine-gun companies remained as an integral portion of the brigades to which they were attached.

The summer of 1916 brought the long-drawn-out battle of the Somme. By this time each infantry brigade had its machine-gun company, which was entirely under the orders and at the disposal of the brigade commander. Throughout the period covered by this battle, it cannot be said that the new brigade machine-gun companies proved to be of any greater value than the former battalion machine-gun sections.

By this time, in the minds of officers of real experience, the following principles had, however, been definitely established. (i.) That the *raison d'être* of machine-guns (*i.e.* Vickers guns) was the support of the infantry in all phases of the battle, and that this support was afforded by supplying covering fire of which a very large proportion must necessarily be overhead fire. (ii.) That the machine-gun was a weapon well adapted for carrying out overhead fire and that this form of fire facilitated disposition in depth. (iii.) That the movements of machine-gun units would rarely synchronize with the movements of the infantry they were supporting; in other words, that although machine-guns fight for the infantry they do not necessarily fight from the same positions as the infantry. In fact, as long as the machine-gun bullets are falling in the right place at the right time, it does not matter to the infantry where the guns are.

Throughout the battle of the Somme the low establishment of the British machine-gun companies had militated seriously against their efficiency. As a temporary measure to remedy this shortage of personnel, the expedient of attaching from 8 to 12 infantrymen to each machine-gun section had been resorted to. These men were mainly employed as ammunition carriers and some attempt was made to train them as machine-gunners. The arrangement was not, however, satisfactory to either the Machine-Gun Corps or the infantry, and, owing to strong representations on the subject from many quarters, approval was given in Oct. 1916 to the addition of two men per gun to the establishment of the machine-gun company. The gun detachment then consisted of six men; but subsequent experience showed that even this number was insufficient, and before the end of the war the establishment was raised to eight men per gun exclusive of headquarters and other details.

By the end of 1916 many of the British divisions in the field had received their fourth (or divisional) machine-gun company. The addition of this company pointed to the necessity for the appointment of a divisional machine-gun commander to control and coördinate machine-gun action within the division. The suggestion that such an appointment should be created met with considerable opposition, and eventually a divisional machine-gun *officer* was appointed, his status being solely that of an adviser, and he was appointed to command the fourth or divisional company only. A corps machine-gun officer, whose status was that of an adviser only, was also appointed in each army corps.

By the beginning of 1917 a distinct advance had been made in the methods of tactical handling of machine-guns throughout the army, due in great measure to the influence exerted by corps and divisional machine-gun officers. There was not such a general inclination to position machine-guns in the front-line trench, and some attempt was made to effect disposition in depth, although the dispositions adopted were entirely linear and still in many cases by single guns. There was as yet little or no realization of the offensive power available in machine-gun fire, *i.e.* the power of the weapon to afford close support to infantry in the attack. Neither had the infantry yet attained much confidence in the overhead fire of machine-guns. In the spring and summer of 1917, however, considerable advance in

the development of machine-gun tactics was made, for which the Canadian Corps must be given full credit. The Canadians had devoted much thought and care to their machine-gun organization and had determined to organize and employ their machine-guns on a divisional basis. They also determined to make full use of the offensive power available in machine-gun fire, for which purpose their machine-gunners had perfected themselves in the use of overhead and indirect fire, and had obtained the equipment necessary for carrying out the latter. The highly successful machine-gun barrage arranged by the Canadian Corps for the support of their infantry in the attack on Vimy Ridge was the first example of the coördinate action of a large number of machine-guns in the British attack. The machine-gun arrangements made by the Canadian Corps were enlarged on in the battle of Messines in June 1917, with highly successful results. Subsequently machine-gun barrage fire, coördinated with the artillery barrage, became a regular feature in all the operations of the British army, whether offensive or defensive, as long as the period of trench warfare continued.

The use of barrage fire led to considerable strides in the development of machine-gun tactics. It proved beyond doubt that the Vickers gun was fully capable of accurate long-range fire and of carrying out overhead and indirect fire with safety, with the result that most of the British infantry units would by this time advance under the fire of their machine-guns with complete confidence. The use of barrage fire also necessitated coördinated action between machine-gun companies, and thus pointed the way to the higher organization of the Machine-Gun Corps. By this time it was realized that the value of the disposition of machine-guns in depth, not only in defence but also in attack, was enhanced by a combination of direct and indirect fire. Consequently machine-guns were now divided into two main categories—forward guns and rear guns. In the attack the forward guns were allotted the rôle of affording immediate support to the leading troops and of assisting in the consolidation of the final objective.

The rear guns supplied long-range covering fire, generally organized in the form of barrage fire, from positions in rear. It must be remembered that at this time the operations still consisted entirely of trench-to-trench attacks with limited objectives, and it was generally possible to site the rear guns so that they could cover the advance of the infantry up to the final objective without moving from their original gun positions.

In any case it was unusual for the rear guns to be obliged to make more than one forward move during the operation.

In the defence the forward guns were allotted for the defence of the outpost line of resistance, whilst the rear guns were disposed in depth for the defence of the battle position. The primary task of the rear guns was the defence of specific areas by means of direct fire; but as a secondary task, subject to limitations as to expenditure of available ammunition, as many of these guns as possible were utilized to afford long-range fire (either direct or indirect) for the assistance of the troops in the more forward areas. No hard-and-fast rules were laid down as to the proportion of forward guns to rear guns, but it was realized that the number of the former must be kept to the lowest possible minimum in order that there might be sufficient depth in the machine-gun dispositions.

By the end of 1917 the following conclusions were also drawn by those who had made a continuous study of machine-gun tactics. (i.) That machine-guns are as valuable in offensive as in defensive operations. (ii.) That, except at close ranges, the fire of one machine-gun is of little tactical value. That the section of four guns is the tactical unit for all purposes of fire direction and control. (iii.) That the machine-gun is a distinctive weapon with tactics of its own, which are neither those of the infantry nor of the artillery, but intermediate between the two. (iv.) That adequate depth in machine-gun dispositions can only be attained and maintained by means of a suitable organization, enabling machine-gun resources to be disposed according to tactical necessity.

Before the end of 1917 it had become apparent that the British machine-gun organization was not suitable for putting into practice the tactical principles enunciated above. The system of having a machine-gun company definitely and permanently attached to each infantry brigade had proved to be very wasteful. Eventually approval was given in Jan. 1918 to the formation of divisional machine-gun battalions. From a tactical point of view the following important results followed:—(*a*) The principle that machine-guns should be allotted and fought on a divisional basis was conceded, and (*b*) the divisional machine-gun *officer*, who was merely an adviser, was replaced by a *commander* who was also an adviser. At the same time it was agreed that the Machine-Gun Corps should be granted higher representation to the extent of the appointment of an inspector of machine-gun units (brigadier-general) at G.H.Q. and of a deputy inspector (colonel) at each army headquarters.

The following brief statement of tactical principles, which were put into practice during the closing stages of the 1918 campaign, indicates the final stage in the evolution of machine-gun tactics during the World War. The section of four guns is the tactical unit of machine-guns and should be kept intact. The maximum fire effect is obtained by the employment of collective fire from a number of guns operating under one control. The use of individual machine-guns, operating alone, results in loss of control, difficulty of supply and dissipation of fire-power. Unity of control is essential if full use is to be made of available resources; within reasonable limits, the larger the number of machine-guns which can be placed under one directing authority the less will be the overlapping of functions and consequent waste of fire-power. Disposition in depth is essential and must be a guiding principle in machine-gun tactics. It enables flexibility of control to be maintained and automatically affords protection to flanks. Unless there is a general prearranged and comprehensive plan for the action of machine-guns, machine-gun units will not be able to render that continuous support during the attack which is necessary if fire superiority is to be gained and if the demoralization of the enemy is to be effected at each successive stage of the advance.

Coöperation is the foundation upon which successful machine-gun tactics rest. To ensure it, the closest possible liaison must be maintained between machine-gun units themselves, and between machine-gun units and other arms. Sustained fire and surprise effect are both dependent upon the skilful use of ground and cover while the gun is being brought up to its position and when it is in action. At close and medium ranges, enfilade fire gives the best results with the minimum expenditure of ammunition. Normally, frontal fire at these ranges should not be used unless an exceptional target presents itself, such as troops in mass. In an offensive operation the fullest advantage must be taken of the mobility conferred on machine-gun units by the use of limbered wagons and pack transport. Resort must only be made to man-handling when all other means of transport have been found impossible. In the attack the first duty of machine-gun units is to assist the advance of the infantry. They must carry out this task by providing covering fire, both direct and indirect; by dealing rapidly with serious hostile opposition, and by producing the greatest fire effect at points where the progress of the infantry is checked. Their other duties are to protect the flanks of the infantry against counter-attacks during the advance; to form pivots upon which the infantry can rally if driven back; and to act as a reserve of fire-power in the hands of commanders for offensive or defensive purposes as the situation may demand. It follows from the above that the disposition of guns in depth must be maintained throughout. In the defence the rôle of machine-guns is to assist the infantry in maintaining their positions. For this purpose machine-guns must be employed—(i.) To assist the infantry in the outpost zone to check and disorganize a hostile attack. (ii.) To assist in the defence of the battle position, should the enemy succeed in crossing the outpost zone. (iii.) To support the infantry and tanks in the execution of counter-attacks.

The bulk of the machine-guns available with divisions in front line must be disposed for the defence of the battle position,

a proportion being retained as a mobile reserve in order to support the action of the offensive reserves in the divisional sectors of defence. Only a small proportion of the available machine-guns should be allotted for the support of the troops in the outpost zone. No attempt should be made to site machine-guns so that every yard of ground is swept by their fire, which should be reserved for protection on a larger scale, covering the more important features and denying to the enemy the most favourable routes of advance. Localities of tactical importance must be strongly covered even though it becomes necessary to leave gaps on parts of the front where an attack is considered less probable. Guns must be sited primarily for the defence of ground by direct fire, but, subject to limitations as regards expenditure of available ammunition, the long-range fire of guns in rearward positions should be utilized for the assistance of troops in the more forward areas.

Such were the tactical principles which were made possible of application by the organization of machine-guns on a divisional basis. Experience showed that a rigid battalion organization on the model of the infantry battalion was not the most suitable for machine-guns. The application of the tactical principles enunciated above necessitated the organization of the divisional machine-guns into groups of varying sizes. But as the machine-gun company was not self-contained as regards train transport and supply, the splitting-up of a company in order to organize the required groups led to considerable administrative difficulties. The organization of a battalion by grouping together the machine-gun companies already in the division was the quickest and least expensive method of placing the machine-gun organization on a divisional basis; but it was subsequently realized that a more suitable organization would have been attained by making each machine-gun company self-contained in all administrative matters in such a manner that sections could be detached as and when required.

**MACHINE TOOLS** (*see* 27.21).—The decade 1910–20 saw a noteworthy development in every branch of machine-tool engineering. In no branch was the progress more marked than in instruments for precise measurements. These include types employing both physical and optical means. Their perfection has made possible the production of interchangeable parts in commercial quantities. Without means of accurate gauging the making of cheap automobiles in great numbers would be impossible. This is also true of rifles, typewriters, sewing-machines and hundreds of other things made and used daily in great numbers. For accuracy and almost universal application, the gauge blocks shown on Plate I., fig. 1, made by C. E. Johansson, Eskilstuna, Sweden, stand high. The first combination set on his system was made in 1897, but not until 1911 was Johansson able to produce them in commercial quantities of a guaranteed quality. Subsequently these blocks became so recognized as standard that there is hardly a manufacturing plant in the world doing accurate or interchangeable metal work that has not one or more sets for reference purposes or actual use. They are also in constant use at the National Physical Laboratory, London; the National Bureau of Standards, Washington; the Bureau International des Poids et Mesures, Paris, and similar institutions of all the principal nations.

A full set consists of 81 blocks with surfaces flat and parallel within one hundred-thousandth of an inch. A standard set is made up of four series. The first series consists of nine blocks, the first 0·1001 in. wide, increasing by 0·0001 in. each to the ninth, 0·1009 in. wide. The second series consists of 49 blocks, the first 0·101 in. wide, increasing by 0·001 in. each to the 49th, 0·149 in. wide. The third series consists of 19 blocks from 0·050 in. to 0·950 in. wide, each increasing by 0·050 in. The fourth series consists of four blocks 1, 2, 3 and 4 in. wide respectively. These blocks may be stacked or "wrung" together to form an enormous number of very accurate "blocks" practically equal to a similar solid block. For instance, the blocks of the fourth series can be combined to give any size in even inches from one to ten. The blocks of the third series can be combined with those of the fourth so as to give any even multiple of 0·050 between 0·050 and 10 in. The second series furnishes means of stacking the gauges to obtain dimensions varying by thousandths, and the first series gives variations by ten-thousandths of an inch. One stack of all the blocks wrung together gives accurate results.

That these blocks are held together by far more than atmospheric pressure is proved by a demonstration given Nov. 10 1917 before the Stockholm Technical Institute. Two blocks were wrung together. The sizes of the two surfaces in contact were 0·49 sq. in. and they sustained a weight of 220 lb. The atmospheric pressure contributed about 6·6 lb., from which it will be seen that the adhesive power of the blocks was more than 30 times atmospheric pressure. In spite of this extraordinary adhesive power the blocks are easily separated by a simple sliding movement, and they are as easily "wrung" together in the same way if the surfaces are first wiped with the hand. The great advantage given by these blocks is that they furnish a practically universal standard of gauging, since parts, gauges, templets or tools, made in England and checked with reference to them, will check the same with a set in America, France or Japan. The composition of these gauging blocks is such that they are long-wearing and little affected by ordinary changes in temperature.

A gauge known as the Prestwich fluid micrometer is shown on Plate I., fig. 2. This is the invention of John Alfred Prestwich, of the English firm of John A. Prestwich & Co., Ltd. It was originally developed about 1910 for use in his own works, but later was put on the market.

The gauge is shown with a piston ring between the gauging points. The lower gauging point, or "anvil," is a stationary block of hard steel set into the base of the instrument. The movable gauging point is set directly above the anvil and is attached to the lower side of a thin, springy diaphragm of metal which forms the bottom of a fluid container about 2½ or 3 in. in diameter, and about ¼ in. thick. A small glass tube leads upward from this container and a coloured liquid is put into the container and extends part way up into the glass tube. Pressure on the movable gauging point presses the diaphragm upward and causes the coloured liquid to rise higher in the glass tube, where it is plainly visible. A graduated scale at one side of the tube shows the amount of upward movement, and pointers at the left of the scale may be set to show the limits for various kinds of work. Owing to the size of the diaphragm and the small hole in the tube, any movement of the gauging point is greatly multiplied by the liquid in the tube, and in some of the instruments a variation of one thousandth of an inch between the gauging points will cause a difference of half an inch in the height of the liquid in the glass tube. This instrument is especially valuable for quickly inspecting machine products, as any variation is instantly visible.

During the World War considerable difficulty was experienced in finding a satisfactory method of quickly inspecting screw threads for size, shape and lead. This was solved in 1916 by the National Physical Laboratory in England, under the direction of Sir R. T. Glazebrook, by means of a projection lantern. The general principle of this lantern is along the lines of the stereopticon or the motion-picture machine, as the threaded (screwed) piece to be inspected is placed in the path of a powerful beam of light which projects a greatly enlarged image of the object upon a screen. An accurate drawing of the screw is previously imprinted on the screen, and the faithfulness with which the projected image conforms to the lines of the drawing instantly determines the accuracy or inaccuracy of the screw or any part of it. Building on this original idea, a number of concerns have placed on the market "comparators," "projectoscopes," "projection lanterns" and similar instruments under various names.

A measuring machine sufficiently accurate for all ordinary shop purposes is illustrated on Plate I., fig. 3. It consists of a bed with a sliding work-table and a microscope mounted on a compound slide. The latter is furnished with a large dial micrometer reading to 0·0001 in. In addition the microscope is fitted with two hair-lines, one rotating with the eyepiece and one with the outside tube. This is fitted with a dial reading to half degrees, while the eyepiece carries a vernier reading to one minute.

The accuracy of measurements depends upon standard rods inserted between blocks at the left-hand end, one block being on the bed and the other on the work-table. The work-table is provided with centres, one of which has cross adjustment for alignment. The method of using this machine will be evident in the case of limit gauges and the like, having plain length measurements, since the selection of suitable measuring rods, the setting of the hair-lines and the reading of the traversing micrometers present no difficulties. With little additional trouble the machine may be used for contour work, while the two hair-lines enable the operator to measure the pitch and angle of screw threads as well as the depth. The table will accommodate work 12 in. long and up to 3 in. in diameter. A lamp and mirror are set as shown in the illustration to give clear projection.

For testing the flatness of a lapped steel surface of a gauge, or other polished surface, the U.S. Bureau of Standards has developed

a tool known as the "optical flat." This consists of a polished piece of flat, clear glass, one surface of which is very accurately flat. The principle is, that if a piece of clear glass with an optically flat surface is laid on another more or less flat surface, and is illumined by monochromatic light, dark and light bands will be observed on the lower surface. If these bands are parallel and equally spaced the surface under inspection is flat. If the bands are curved, then the surface below the glass is curved, the reason being that a difference in the thickness of the film of air between the adjacent surfaces causes a variation in the direction and spacing of the light bands. By observing certain conditions of light and position, flatness to within one millionth of an inch may be plainly observed with the naked eye.

The diagrams shown on Plate I., fig. 4, indicate how light bands, or "interference fringes," look when an optical flat is laid on surfaces of different degrees of flatness. The optical flat may be used for comparing the height of two pieces laid side by side. If one is higher than the other the arrangement of the light bands will instantly indicate it. Curved surfaces may also be as easily inspected and the amount of error estimated. Complete apparatus for accurately measuring with optical flats is made by H. L. Van Keuren, Boston, Mass.

Among recent developments in the small-tool field, those of importance in lathe and planer cutting tools have been slight, apart from the research work of the late Frederick Taylor, of Philadelphia, and the advances in steel making and treating which make the tools more durable. Taylor spent many years and much money investigating the proper shape, clearance and cutting angles for lathe and planer tools. He also designed and built for the market a machine for grinding these tools according to the shapes outlined in his charts. He also did a share of the work in evolving the Taylor-White process of hardening high-speed steel, which made possible higher speeds and heavier cuts than had previously been imagined. This discovery profoundly affected machine design as well as production methods, since it compelled the building of heavier, speedier and more powerful machine tools to meet the severe demands placed upon them by properly hardened high-speed steel. Except for this strengthening, standard lathes, planers and shapers have really advanced but little. One feature, however, may be noted, and that is the increasing use of air-operated chucks on turret lathes (monitors) and chucking-machines.

An unusual type of single-purpose lathe was designed by Lucien I. Yeomans, of the Amalgamated Machinery Co., Chicago, for which he was awarded a medal by the Franklin Institute of Philadelphia. This type of lathe was intended for making large shell of from 6 to 16 in. in diameter. The head-stock and body of the lathe were cast in one solid piece, with holes cored out for the spindle and ways. The ways were merely accurately ground lengths of round steel shafting so placed that the ends projected through the cored holes in the bed. They were properly located by means of huge master jigs, and then type-metal was poured into the cored holes and around the ends of the shafting. This held them securely in place. The carriage and cross-slide guides were made and located in the same general way. The lathe spindle turned in a machined bushing which was set into the cored hole in the head and secured with type-metal. This method of construction saved an immense amount of machining, as there was no work put into its construction except such as could be turned or bored. The makers were enabled to turn out a large number of machines in an astonishingly short time, and they agreed to furnish any order for such machines at the rate of 10% per day, beginning with the confirmation of the order. The American Car and Foundry Co. had 173 of these machines in one battery making shell, and other large installations were placed. A number of large gun-boring lathes were also made on the same plan, but the close of the World War put an end to this work, as the machines were not suited to other purposes. A wartime machine designed and built by Yeomans was a "concrete planer" with a 93-ft. table and 185-ft. bed, used for gun-carriage work. All of the heavy parts, including the bed, table and housings, were made of reinforced concrete with inserted metal ways and facings. Five of these machines were made for Government war work. At the time the Armistice was signed the bed for a planer 500 ft. long had actually been almost completed.

Closely allied to the lathes are the machines of the vertical boring-mill type. Most of these are well known, but modern manufacturing methods have induced the design of certain advanced types, such as the duplex boring-mills made by two English houses, Webster & Bennett, Ltd., of Coventry, and G. Wilkinson & Sons, of Keighley (see Plate I., fig. 5).

Rapid production has also been responsible for what is known as the vertical "station-type" of machine. These machines are an outgrowth of the vertical boring-mill or "vertical turret lathe."

A typical example is the "Mult-Au-Matic" (Plate I., fig. 6) made by the Bullard Machine Tool Co., Bridgeport, Conn. In this machine there are six "stations" or chucks, though other holding devices may be used. The chucks are mounted on a table which "indexes" or makes ⅙ of a revolution at set periods, bringing the work under different tools each time. Each chuck revolves or remains stationary on its own centre, making it possible to do drilling, boring, facing, turning and other work either simultaneously or successively. One station is used for the insertion and removal of the work, and after the chucks have once been filled all round, a piece of work is removed and another inserted at each indexing of the table. This machine is mechanically operated throughout; but a similar machine, in which all the feeding and indexing movements are hydraulically operated, is made by Giddings & Lewis, Fond du Lac, Wis.

Drilling-machines of the station type are also made by several concerns. One made by the Cincinnati Automatic Machine Co., Cincinnati, Ohio, is shown in Plate II., fig. 7. Both of these types were foreshadowed by the five-spindle automatic screw machines made by the National Acme Co., Cleveland, O., whose machines have been on the market for over 25 years. The general principle is the same, the main difference, as in the case of the lathe and the boring-mill, being that one is horizontal and the other vertical, the latter being of much later date in each case.

Apart from the station-type drilling-machines, others now in common use include those of the "gang" and the "multiple spindle" types. The gang types consist mainly of several individual drilling-machines of a like size bolted side by side, or mounted on a single base. The multiple spindle type may have a considerable number of spindles mounted on a single head, the spindles being run by worms, gears or universal joints.

Gear-driven spindles lend themselves well to mounting in heads which may be used in the spindle of ordinary single-spindle drilling-machines. Holes of varied arrangement or "pattern" may be simultaneously and quickly drilled in this way. The worm-driven spindles are more conveniently used if mounted on a cross-rail, making it possible to drill a large number of holes in a straight line, although the spacing between the various holes may be varied. The universal joint-driven spindles (Plate II., fig. 8) furnish the most flexible means of arrangement of all, as they may be set to conform to almost any arrangement or pattern of holes. The National Automatic Machine Co., Richmond, Ind., and the Foote-Burt Co., Cleveland, O., have made many machines drilling up to 100 or more holes at once. Some of their machines feed a large number of drills in from several angles at once. For instance, one model simultaneously drills from 5 to 20 holes in each of five sides of a cast-iron box.

Milling-machines form attractive subjects for tool designers, and new forms are constantly being evolved. The more modern forms include the continuous milling-machines, which are of two principal types, the rotary and the reciprocating.

The reciprocating machine is simply a modification of the regular type of milling-machine. It carries fixtures for holding the work at opposite ends of the table. While the cutters are acting on the work at one end of the table the fixtures at the other end are being emptied and reloaded. The feed of the table is reversed as soon as the work is milled, and the cutters immediately begin to cut on the work in the other fixture. The operator then steps to the other end of the table, removes the finished work and reloads the fixture, and so on.

The rotary continuous milling-machines may be of the horizontal-table-vertical-spindle, or the vertical-table-horizontal-spindle, type. On Plate II. are shown examples of the former, the more common (fig. 9), another form, with work-holding fixtures in place (fig. 10), and of the vertical-table, or "drum type" (fig. 11). In all of these shown in the last three cuts the table moves continuously, the work being removed or inserted while in motion. A machine built on a slightly different plan is shown on Plate III., fig. 12. In this the table is tilted and the motion is not continuous. The table movement more closely resembles that of a station-type machine in that it indexes and remains stationary as the cutter is fed to the work by the sliding spindle head. Milling-machines of the planer type shown on Plate III., fig. 13, are made in a variety of forms, largely for automobile work. They may carry from one to a dozen cutters placed on spindles at various angles. In some cases the tables are made to reciprocate and one end of the table may be emptied and reloaded while the cutters are at work at the other end, after the manner of the lighter types previously referred to.

A highly developed type of milling-machine is shown on Plate III., fig. 14. This is an automatic profiling-machine designed for the sinking of forging dies and the like. In the illustration a model or master-die is shown below and a finished forging die above. Any number of dies may be made from the same pattern and they will be all alike. A "finger" is automatically fed over the surfaces of the model and as it moves a revolving cutter cuts corresponding

depressions in the die block above. After the die is cut it must be smoothed by hand, as the milling cutter leaves a rather rough surface.

In grinding-machines there are several models made with rotary tables, like those of the continuous milling-machines. Magnetic chucks are largely used on this type, as well as on others of the reciprocating-table and the horizontal-table types.

One of the principal developments has been the use of grinding wheels, which are fed straight in to the work. These wheels are wide enough to finish the surface desired, and the face is formed to conform to the contour of the finished work. This shape of the grinding wheel is obtained by means of a master form and diamond truing tool. A form of machine, known as the "centreless grinder," makes use of a wide-faced wheel, the face of which is dressed bevel. Small steel pins or rods fed across the face of this wheel by means of a grooved guide are automatically ground to size without the necessity of having centre holes drilled in them, as is necessary with the usual type of cylindrical grinder.

Broaching-machines are largely a development of the automotive industry. The La Pointes in the United States and Alfred Herbert in England have built most of the machines of this kind.

A broach is a tool having a number of saw-like teeth so made that they will finish or machine a hole or surface when moved through or over it. As a rule, the teeth of a broach are made to increase a thousandth of an inch or more in size until the last few, or finishing teeth, are reached. These last teeth merely scrape so as to properly size the work. A very common use for broaches is in the production of keyways in gears or wheels. With a properly made broach a keyway may be finished at one pass with no danger of spoiled work. Broaches are either pushed through the work by means of a press or are pulled through by means of a special machine, such as shown on Plate III., fig. 15.

In the example shown the broach is used to finish the inside corner of a type-chase, but almost any form of hole may be broached. In many cases round broaches take the place of reamers for finishing round holes. A round hole may be squared at one pass, or it may be as easily made into a hexagon, splined or irregular shape. In the special machines the broach is pulled through the work by means of a screw in a majority of cases, though some machines are made with a rack-and-pinion movement instead of a lead screw.

Swaging-machines for the cold hammering down of bars or rods are made by the Langelier Manufacturing Co., Providence, R.I. One such is shown on Plate III., fig. 16. A small rod is shown held in a sliding holder. As this rod is pushed into the head of the machine it is hit on opposite sides by hammers operating at a high rate of speed. The rod will be reduced to a point, or to a smaller diameter, according to the shape of the ends of the hammer-heads. Round parts or reduced sections are easily produced almost instantly. A familiar example of swaging can be seen in the reduced sections of bicycle or wire automobile spokes. Sewing-machine needles and other similar work are also reduced in machines of this type.

(E. VI.)

**MACKAY, CLARENCE HUNGERFORD** (1874– ), American capitalist, was born at San Francisco April 17 1874. He was a son of John William Mackay (*see* 17.250), who had wide interests in cable and telegraph lines. He received his education in Europe, chiefly in England and France, and at the age of 20 entered his father's office in New York. In 1896 he was made president of the Forcite Powder Manufacturing Co., and also a director of the Commercial Cable Co. and the Postal Telegraph Co., being made vice-president of both a little later. After his father's death in 1902 he succeeded to the presidency of various companies, including the Commercial Cable Co. and the Postal Telegraph Cable Co. He was elected president of the Mackay Companies, organized in 1903, and owning all the capital stock of the Commercial Cable Co. and a majority of the stock of various cable, telegraph and telephone companies in the United States, Canada and Europe, including the Postal Telegraph Cable Co. In 1921 the Mackay Companies operated some 350,000 m. of wires and 29,000 m. of cables, connecting with all parts of the civilized world. At that time the Commercial Cable Co. owned cables from Ireland to England and France, five cables from America to Europe, cables along the North Atlantic coast, a cable from New York to Cuba, a cable from Florida to Cuba, and a Pacific cable from San Francisco *via* Honolulu, Midway, Guam and Manila, to Shanghai, with an extension to Japan. The Postal Telegraph Cable Co. owned a telegraph system throughout the United States, and at the same time used many thousand miles of the same wire for long-distance telephone. Acting under authority of a joint resolution of Congress of July 16 1918, President Wilson took over the wires as from Aug. 1 1918 and placed them under the control of Postmaster-General Burleson. Mr. Mackay opposed many of the Postmaster-General's policies on the ground that he was using war-time control to bring about Government ownership of the wires. In Dec. Mackay was removed from control of the Commercial Cable Co., and all cables taken over by the Government were placed under the president of the Western Union Telegraph Co. In March 1919 he was also dismissed by order of the Postmaster-General from the presidency of the Postal Telegraph Cable Co., but was reinstated after the return of the wires to their private owners in 1919.

**MACKAYE, PERCY** (1875– ), American poet and playwright, was born in New York City March 16 1875. He graduated from Harvard in 1897 and later was a student in the university of Leipzig. From 1900 to 1904 he was a teacher in private schools in New York, and in the latter year became a member of the Cornish (N.H.) colony of artists and writers. He was made a member of the National Institute of Arts and Letters in 1914.

His numerous works include *The Canterbury Pilgrims* (1903); *Fenris the Wolf* (1905); *Jeanne d'Arc* (1906, played by E. H. Sothern and Julia Marlowe); *Sappho and Phaon* (1907); *The Scarecrow* (1908); *The Playhouse and the Play* (1908, essays); *The Civic Theatre* (1912); *Sanctuary* (1913, a bird masque); *A New Citizenship* (1915, a civic ritual); *Caliban by the Yellow Sands* (1916, a community masque to commemorate the Shakespeare Tercentenary); *Community Drama* (1917, essay); *Rip Van Winkle* (1919, folk opera); *The Pilgrim and the Book* (1920, a dramatic "Service" for celebrating the Pilgrim Centenary). In 1912 he edited with J. S. P. Tatlock *The Modern Reader's Chaucer.*

**McKENNA, REGINALD** (1863– ), British politician and financier, was born in London July 6 1863, and educated at King's College. He went up to Trinity Hall, Cambridge, as a scholar and graduated as a senior optime in 1885, being elected an hon. fellow of his college in 1916. He also gained distinction as an oar, rowing bow in the university eight in 1887. He was called to the bar in 1887, and practised till, after an unsuccessful attempt at Clapham in 1892, he was elected Liberal member for North Monmouthshire in 1895. He found his party in opposition, but during the following ten years he established a reputation as a vigilant and acute critic of ministerial proceedings, especially in matters of education and finance. When his party returned to power in Dec. 1905 he became Financial Secretary to the Treasury, and in 1907 was promoted to the presidency of the Board of Education, but he was no better able than his predecessor, Mr. Birrell, to draft a bill which would satisfy the Nonconformists and yet pass the House of Lords. His tenure of the office was brief, as, on Mr. Asquith's succeeding to the premiership in the spring of 1908, he was transferred to the Admiralty.

He entered on his new duties at a time when the country was profoundly stirred by the rapid increase of the German fleet, and was in doubt whether the preparations of the Admiralty were on a sufficiently extensive scale. At the same time a large portion of the Liberal party was disposed to belittle the danger and to call a halt to building-schemes in the interest of peace and economy. Mr. McKenna, relying upon the advice of his First Sea Lord, Lord Fisher, resisted the section of the Cabinet, represented by the powerful figures of Mr. Lloyd George and Mr. Churchill, who took this last view; and, supported by the Prime Minister and Sir Edward Grey, he persuaded his colleagues to begin the building of four battleships of the "Dreadnought" type in 1909, and to ask for power, if necessary, to prepare for the construction of four more a year later. This programme disgusted the Radical economists, but did not satisfy public opinion. The Unionists and other friends of a big navy carried on an agitation to the slogan, "We want eight, and we won't wait," and eventually, on July 26, Mr. McKenna announced that the second four Dreadnoughts would definitely be ordered. The estimates of 1909 had shown an increase of nearly £3,000,000; those of 1910 showed a further increase of £5,500,000, mainly due to new construction. A still further increase of £3,750,000 in 1911 made it clear that Mr. McKenna and the Admiralty were in earnest in their determination to maintain "a fleet sufficient to hold the seas against any reasonably probable combination." In June 1911 he was able to make satisfactory arrangements at

the Imperial Conference for complete unity of action in time of war between Dominion fleets and those of the mother country. He could feel, when in the autumn he passed from the Admiralty to the Home Office, that he left behind him a much stronger fleet than he had found. As Home Secretary he had charge of the Welsh Church Disestablishment bill.

When war broke out in Aug. 1914 he had the arduous duty of safeguarding the country against the machinations of spies—a task in which it was impossible to give entire satisfaction to a sensitive public. When Mr. Asquith's Coalition Ministry was formed in the summer of 1915 he was made Chancellor of the Exchequer, and a still more difficult task was imposed on him—to find the money to carry on the war. By the 4½% War Loan a subscription of nearly £600,000,000 was obtained. He also raised a loan of £100,000,000 in the United States on the joint credit of England and France. In the autumn he introduced a supplementary war budget for the year, providing over £100,000,000 by new taxation. Income-tax was raised 40%, and the abatement and exemption limits lowered; the rates of super-tax were seriously heightened; all the old duties on sugar, tea, tobacco, cacao, coffee, motor spirit and patent medicines were almost doubled; the import of luxuries such as motor-cars, cinema films, clocks and musical instruments was restrained by an *ad valorem* duty of 33⅓%; and an excess profits tax of 50% was imposed. Other methods of financing the war which he adopted were War Savings Certificates, which realized over £40,000,000 in their first year; 5% Exchequer bonds, replaced after a year for a short time by 6% Exchequer bonds; but for current expenses he relied mainly on the sale of Treasury bills, of which at the end of his period of office in Dec. 1916 there were over £1,000,000,000 outstanding. In his 1916 budget he raised taxation still further. Income-tax was increased to 5s. in the pound and excess profits tax to 60%; there were further increases on sugar, cacao and coffee; higher duties were imposed on motor vehicles; there were new taxes on amusements, railway tickets, matches and mineral waters. He calculated that the country was raising over £300,000,000 in the year by new taxation imposed since the war; and he budgeted for a net revenue of £502,000,000 to meet an estimated expenditure of £1,825,000,000. He enunciated the doctrine that Great Britain ought never again to be dependent for supplies or many essential commodities on a nation like Germany which in peace had plotted and prepared for war; and he said that Government was prepared to assist the development of British foreign trade.

Mr. McKenna went out of office with Mr. Asquith in Dec. 1916, and, along with other Liberal leaders who had refused to serve under Mr. Lloyd George, lost his seat at the General Election of Dec. 1918. He made no attempt to reënter the House, but accepted the position of chairman of the London City & Midland Bank in 1919. He speedily gained a position of financial authority in the City. He married in 1908 Pamela, daughter of Sir Herbert Jekyll, and had two sons. (G. E. B.)

**MACKENSEN, AUGUST VON** (1849– ), Prussian field-marshal, was born Dec. 6 1849 at Hausleipnitz in the Prussian province of Saxony. His career was in the cavalry, and he at one time commanded at Danzig the well-known regiment of Hussars who wore a silver skull and crossbones on their busbies. As the commander of the XVII. Army Corps he was brought into close touch with the German Crown Prince at a time when the heir to the imperial dignity had been sent to Danzig in order to withdraw him from the temptation of meddling with politics. In 1914, at the outbreak of the World War, Mackensen was appointed to the command of the IX. Army on the eastern front, and won victories over the Russians at Kutno, Lodz and Lowitz. After April 1915 he led the German troops in western Galicia and helped to break through the Russian line at Gorlice. On June 20 of the same year he was made a field-marshal. In the advance into Russia Mackensen took Litovsk on Aug. 26 and Pinsk on Sept. 15 1915. Later in the autumn of the same year he was in command of the army sent against Serbia, and in 1916 he commanded the expedition against Rumania. In Nov. 1918, after the conclusion of the Armistice, when the German troops were being brought home from the Balkans, he was detained by the French and interned at Neusatz, where, in spite of many protests from the German Government, he remained until he was set at liberty at the beginning of Dec. 1919.

**MACLAGAN, WILLIAM DALRYMPLE** (1826–1910), Archbishop of York, was born in Edinburgh June 18 1826. He began life in the army, retiring as lieutenant in 1852 in order to go to Cambridge to study for the Church. He became a London rector, first at Newington and then at St. Mary Abbott's, Kensington, and in 1878 was nominated by the Crown to the bishopric of Lichfield. In 1891 he was made Archbishop of York. In 1899 he sat as assessor with Dr. Temple, Archbishop of Canterbury, when the decision was given against the use of incense and other ritualistic practices, and though himself a strong High Churchman he loyally upheld the primate's "opinion." He resigned his archbishopric in 1908, and died in London Sept. 19 1910.

**M'MAHON, SIR ARTHUR HENRY** (1862– ), British soldier and administrator, was born Nov. 28 1862, the son of Gen. C. A. M'Mahon, F.R.S. He was educated at Haileybury and afterwards entered Sandhurst, where he obtained a sword of honour in 1882. In 1883 he joined the army, and in 1885 was appointed to the Indian Staff Corps and entered the Punjab frontier force. In 1890 he joined the Indian Political Department, and after acting as political agent in various small states was in 1901 appointed revenue and judicial commissioner in Baluchistan. From 1903 to 1905 he was commissioner in Seistan, also acting as arbitrator on the boundary question between Persia and Afghanistan in Seistan. In 1906 he received the K.C.I.E. From 1905 to 1911 he was agent and chief commissioner in Baluchistan, and from 1911 to 1914 Foreign Secretary to the Government of India. He was appointed Master of Ceremonies to King George V. during his visit to India (1912) and in 1914 became first High Commissioner for Egypt under the British Protectorate. He retired from this office in 1916 and was created G.C.M.G.

**MACNAGHTEN, EDWARD MACNAGHTEN, BARON** (1830–1913), British judge, was born in London Feb. 3 1830, the son of Sir Edmund Macnaghten, 2nd bart., of Dundarave, co. Antrim, whose baronetcy he succeeded to on the death of his elder brother, the 3rd bart., in 1911. He was educated at Queen's College, Belfast, and Trinity College, Cambridge, where he was bracketed senior classic in 1852. He was an enthusiastic oarsman, winning the Colquhoun sculls at Cambridge (1851), and the diamond sculls at Henley (1852). He was called to the bar in 1857, and became Q.C. in 1880, and a lord of appeal and life peer in 1887, having previously refused a judgeship. He sat as Conservative member for co. Antrim from 1880–5, and for co. Antrim (northern division) from 1885–7. Among the many important cases in which he came into prominence as a lord of appeal were the Taff Vale case of 1900–1, the Osborne judgment of 1909, both of these being concerned with points of trade-union law, and the Scottish Church case of 1904. He was also one of the arbitrators in the boundary dispute of 1899 between Chile and Argentina. Lord Macnaghten died in London Feb. 17 1913. His life peerage became extinct, but he was succeeded as 5th bart. by his son Edward (1859–1914).

**MACNAMARA, THOMAS JAMES** (1861– ), British politician, was born at Montreal Aug. 23 1861. He was educated at St. Thomas's school, Exeter, and was afterwards trained as an elementary-school teacher at the Borough Road training college for teachers. He taught in various schools until 1892, when he became editor of the *Schoolmaster*. He was elected a member of the London School Board in 1894; in 1895 he unsuccessfully contested Deptford as a Radical, and in 1896 was elected president of the National Union of Teachers. He was elected for North Camberwell in 1900, and in 1907 entered the Government as parliamentary secretary to the Local Government Board. In 1908 he became parliamentary secretary to the Admiralty, retaining this office until 1915, when he became financial secretary to the Admiralty. He lost his seat in 1918, but the same year was elected for North-West Camberwell. In 1920 he became Minister of Labour in succession to Sir Robert Horne.

**MACNAUGHTAN, SARAH BROOM** (1864–1916), British novelist, was born at Partick, near Glasgow, Oct. 26 1864, the sixth child of Peter Macnaughtan, secretary to the British Steam Navigation Co. She was educated at home in Glasgow, and on the death of her parents came to England, living first in Kent, and then in London. Her first novel, *Selah Harrison*, appeared in 1898, and it was followed by several others, the best known being *The Fortune of Christina M'Nab* (1901); *A Lame Dog's Diary* (1905) and *The Expensive Miss Du Cane* (1907). She travelled a good deal, and had considerable experience in army nursing, gained partly in South Africa. At the beginning of the World War she joined Mrs. St. Clair Stobart's ambulance unit, and was head orderly through the siege of Antwerp, afterwards working under fire on the Belgian front. For this she received the Order of Leopold. In 1915 she went to Russia, penetrating as far as Persia, where illness overtook her. She returned to England in May 1916 and died in London July 24.

She had published *A Woman's Diary of the War* (1915), and a further account of her work, edited by her niece, Mrs. Lionel Salmon, *My War Experiences in Two Continents*, appeared in 1919.

**MACVEAGH, WAYNE** (1833–1917), American lawyer and diplomatist (*see* 17.269), died in Washington, D.C., Jan. 11 1917. After the outbreak of the World War he championed the cause of the Allies in an article, "The Impassable Chasm," contributed to the *North American Review* for July 1915. In his last article, "Lusitania Day: May 7 1916," published in the same magazine for June 1916, he assailed the slowness of the American Government in asserting its rights against Germany.

**MACWHIRTER, JOHN** (1839–1911), British landscape painter, was born at Slateford, near Edinburgh, March 27 1839. He began his art training under Robert Scott Lauder, and was elected a member of the Royal Scottish Academy in 1867, A.R.A. in 1879 and R.A. in 1893. His "June in the Austrian Tyrol" was bought in 1892 out of the Chantrey bequest. He died in London Jan. 28 1911.

**MADAGASCAR** (*see* 17.270).—The total pop. was estimated in 1921 at 3,504,900, including 17,600 Europeans (of whom nine-tenths were French), 5,300 Asiatics or Africans, and 3,482,000 natives of whose origin, because of their constant migrations, little was known. The pop. of Tananarivo (Antananarivo), the capital, was about 75,000. Madagascar is divided for purposes of administration into 23 provinces and 2 autonomous districts. Colonization takes place under the system of Government land concessions, limited to 10,000 hectares each and held under grant from the governor-general either free or subject to certain payments. The free concessions are reserved for French citizens, but land and forests near the railway connecting Tananarivo with the east coast can only be conceded by auction.

Tananarivo is connected with Tamatave, the chief port, by a railway 230 m. long, and another railway 100 m. in length runs from Tananarivo to Antisarabe, a watering-place.

Rice cultivation has greatly extended in consequence of improved means of transport, which made possible the establishment of large mills: the export in 1919 was 21,000 tons, valued at 12,436,000 francs. 14,886 tons of manioc, valued at 8,608,000 fr., were exported, for arrow root. Mangrove bark, used for tanning, is obtained in the forests, which cover ten to twelve million hectares. The frozen meat industry developed considerably during the World War; the export in 1919 amounted to 22,083 tons, valued at 66,131,000 francs. There were in 1921 eight million head of cattle, of which 420,000 were destined for slaughter. Six factories had been installed and the prospects of the industry were extremely favourable.

Coal occurs in four principal seams, one of which is 15 ft. thick. Heavy oils are obtained at great depths. The exploitation of graphite, which occurs in a stretch of country 750 m. in length, developed rapidly during the war, 27,838 tons being produced in 1917. Uraniferous and other radioactive ores also occur.

The total commerce of Madagascar, which in 1896 was about 17½ million fr., was in 1919 276,140,327 fr., of which imports represented 98,972,737 fr. and exports 177,167,590 fr.; trade with France, the United Kingdom and British colonies was as follows:—

| | *Imports* fr. | *Exports* fr. |
|---|---|---|
| France | 40,736,379 | 51,682,000 |
| United Kingdom | 12,215,181 | 5,113,000 |
| British Colonies | 27,227,962 | 4,139,771 |

RÉUNION (*see* 23.206), although nominally a dependency of Madagascar, is in effect a department of France. The cultivation of sugar, which is the chief industry, continued to develop, the annual export being between 30,000 and 40,000 tons, along with 35,000 to 40,000 hectolitres of rum. The production of vanilla also made progress. The general trade in 1918 amounted to 60,582,000 fr. (of which 16,592,000 were imports), showing an increase of 11,797,000 fr. over the previous year and an excess of 17,642,000 fr. over the average for the five years 1913–7.

**MADERO, FRANCISCO INDALEGIO** (1873–1913), Mexican president, was the son of Evaristo Madero, governor of Coahuila under Díaz and a large property owner of Jewish extraction. He was born on the family estate, Rosario, at Parras, Coahuila, Oct. 18 1873. His youth was employed in managing the family properties. During part of 1893 he attended the university of California. By 1903 he was known for independent political views, and in 1905 opposed the Díaz candidate for state governor. In 1908 he began his opposition to the reëlection of Díaz in 1910, writing *La sucesión presidencial en 1910*, which went to three editions. In 1909 he headed the anti-reëlectionist party as candidate for the presidency. His vigorous campaign was ignored by Díaz until June 1910, when he was arrested at Monterrey for seditious utterances at San Luís Potosí and incarcerated until after the election of Díaz. Being released on bail July 20, he escaped Oct. 7 to San Antonio, Texas, where he issued the Plan de San Luís Potosí, dated Oct. 5. It was then evident that the Díaz election had been legally affirmed. The revolutionists in San Antonio voted Nov. 6 to begin armed revolts simultaneously throughout Mexico. Disturbances began prematurely, and Madero, threatened with arrest for violation of neutrality, crossed into Chihuahua and headed the movement begun by Pascual Orozco and others. The revolutionists took Ciudad Juárez early in May, ending the prestige of Díaz, who resigned under pressure May 25. Madero entered Mexico City in triumph June 7. During the *ad-interim* presidency of Francisco de la Barra he was elected President in Oct. and inaugurated Nov. 6 for a term to end Nov. 30 1916. His rule was marked by visionary schemes which provoked party dissensions. Revolts caused strained relations with the United States. The revolutionary programme did not become law. Felix Díaz, nephew of Porfirio Díaz, revolted, but was captured in Oct. 1912. General Bernardo Reyes, ex-governor of Nuevo León, had previously been captured in the United States and given over to Mexico. Both were confined in the capital, but they were released Feb. 9 1913 by a rising of military cadets. Government troops joined them, besieging the national palace for 10 days. Then Huerta, commanding Madero's troops, deserted him, and forced the President and vice-president, José Pino Suárez, to resign Feb. 18. Although promised personal safety, they were killed on the night of Feb. 22 while being removed from the national palace to the Penitenciaría. In Nov. 1920 Francisco Cárdenas, the alleged assassin, committed suicide in Guatemala while under arrest for extradition demanded by the Mexican Government. (H. I. P.)

**MAETERLINCK, MAURICE** (1862– ), Belgian dramatist and poet (*see* 17.298), produced his most popular work, *L'Oiseau bleu*, in 1911. It was first performed in Moscow, then in London as *The Blue Bird*, and later in Paris and New York. *Mary Magdalene* appeared in 1910, and in 1913 *La Mort de Tintagiles* was acted in London. During the World War he published a volume of essays, *Les Débris de la Guerre* (1916), and in 1919 appeared *Les Sentiers dans la Montagne* and two plays, *Le Miracle de St. Antoine* and *Le Bourgmestre de Stilmonde*. In 1921 his play *The Betrothal*, originally published in 1918, was produced in London, with special settings designed by Charles Ricketts.

**MAGAZINES:** *see* NEWSPAPERS.

**MAGAZINES AND SHELL STORES.**—In the following article an account is given of the storage of explosive ammunition in arsenal conditions, in fortresses, and in field warfare, from the point of view of safety and condition. Administration and working are discussed under SUPPLY AND TRANSPORT, and questions of site under BARRACKS AND HUTMENTS and TRAINING CAMPS. A "magazine" is a building or buildings with passages leading thereto in which are stored explosives in bulk. A magazine

must be under special "magazine" conditions with regard to precautions against fire or explosion. An "explosive store" is a building, standing apart from others, used for storage of explosives which are not kept under magazine conditions. A filled "shell store" is a store in which filled shells are kept.

Although in England the Explosives Act, 1875, expressly exempts Government magazines from its provisions, the conditions imposed by the Act apply generally to them.

The general principles that govern the arrangement for a magazine in Great Britain are as follows.

*Site.*—The site should be remote from dwelling houses, and from embankments for preventing inundations, as well as from any property which might be injured by an explosion. The distances away from buildings in which fires are used vary according to the amount of explosive to be stored, but 200 yd. may be generally assumed to be sufficient. Public thoroughfares or buildings having chimneys should not be permitted in the vicinity of a magazine; and such an extent of land should be acquired round the magazine as would preserve the isolation of the site. In this connexion two points have to be considered: (*a*) the danger to the magazine arising from too close proximity of other buildings; and (*b*) the danger to those buildings from the effect of the explosion of the magazine. The best protection is afforded by intervening heights of ground. Failing that, much protection is afforded by massive traverses of earth; and close plantation of trees will reduce the effects of explosion.

*Construction.*—The structural arrangements must be such that when the magazine is closed it will be as airtight as possible. The building should be substantially built, or excavated in solid rock, earth or mine refuse not liable to ignition; and be so made and closed as to prevent unauthorized persons having access thereto and to secure it from danger from without. Every magazine should have a lightning conductor. The compartments inside a magazine must be separated by partitions of such substance and character as will effectively prevent explosion or fire in one communicating with another. Protection must be provided against weather and dampness, and ventilation cared for. Suitable and uniform temperatures must be maintained. If a heating system is installed, it should be a steam or hot-water apparatus, with the pipes detached from the walls and clear of any timber work. In tropical climates cooling apparatus may be necessary when the temperature is continuously or for long periods above 70° F. In every magazine a chamber or portion of the entrance passage must be set aside for the putting on and taking off of magazine clothing and a barrier arranged between it and the magazine. Metal working parts of every kind used inside a magazine, such as locks, bolts, window fastenings, truck wheels, rails, and working parts of lifting machinery, must be of copper or copper alloy. This applies generally also to hand tools. For floors, a suitable asphalt, devoid of grit, is well adapted, and a rendering of "neat" cement for linings. Dados of glazed brick may be used to prevent the cement being detached by packages knocking against the walls. The interior of the building, and the benches, shelves and fittings should be of non-inflammable material, or be so lined or covered as to prevent the exposure of any iron or steel, or detaching any grit in such manner as to come into contact with the explosives in store. If the magazine be intended for storing cordite only, it should be of as light a form of construction as possible.

*Working Conditions.*—Lighting fires or smoking in or near a magazine is, of course, absolutely prohibited. Due provision must be made, by the use of suitable working clothes without pockets, suitable shoes, searching and otherwise, for preventing the introduction of tobacco pipes, tobacco in any form, matches, grit in any form, exposed iron or steel articles, or any substance or article likely to cause explosion or fire. Operations of weighing and packing should not be carried out in a magazine. Only lamps of special pattern must be used, and these, when not in use, must be kept in the proper lamp room. When electric light is installed, the distributing board must be outside the barrier of the shifting lobby.

For explosive stores the regulations for magazines are modified as regards the necessity for special clothing, but otherwise the regulations for magazines should be strictly enforced.

For the purpose of storage, all British service explosives are classified as follows:—

GROUP I. including generally all explosives in bulk, and cartridges if not protected by metallic cases. The explosives in this group must be stored in a magazine.

GROUP II. including percussion caps, detonators, fuzes, gaines, igniters, primers, tubes and similar items. The explosives in this group must be kept in an explosive store.

GROUP III. including inert fillings for shells and quick-firing cartridges. The explosives in this group may be stored in either a magazine or explosive store.

GROUP IV. including various bombs and chemical shell. The explosives in this group must be stored in a separate explosive store.

Each group is subdivided into divisions according to the characteristics of the explosives, which must each be kept in a separate compartment of the magazine or explosive store. Packages should be securely stacked in the several bays, and a clear space left between them and the walls to allow of free circulation of air and to prevent injury from damp.

In fortresses and defensive works, magazines and stores, from their position, must usually be more or less exposed to enemy fire, and must therefore be of sufficiently strong construction to keep out projectiles. Heavy traverses should be built round them. The general regulations regarding safety in magazines must be strictly adhered to, but as regards storage, variations may be permitted so as to allow fuzes and tubes to be kept in the shell stores adjoining the guns, provided that special shelves are fixed for them. In fortresses, cartridges, shells, etc., are always kept in batches according to date of manufacture and filling, in order to obtain uniform effect in firing.

In a theatre of war such definite provision of magazines and explosives stores cannot be made, except perhaps at the main base; and the necessary arrangements have to be improvised at base depôts and advanced depôts. Specific instructions cannot be given to meet all the contingencies of varying local conditions, and adequate measures must depend upon local ingenuity and constant supervision. The regulations for safety should be observed, whatever building or shelter is used.

Wooden huts with corrugated iron roofs can be employed in connexion with storage of explosives and ammunition; a height of 8 to 10 ft. from floor to eaves would be suitable, and such huts can be made splinter-proof by layers of sand-bags. A large storage hut may occupy a space 30 ft. wide by 300 ft. long, and would be divided into compartments or bays by traverses made of double walls of galvanized iron sheeting. A floor of road metal, rammed hard, would suffice. When a building is not available, a raised floor with tarpaulin supported on a framework, so as to allow of ventilation, is readily improvised. All explosives should be kept in substantial cases or receptacles where possible. All ammunition necessarily kept in the open should be stored on battens and covered with tarpaulins, which covering should be removed whenever conditions are favourable in order to permit of ventilation and to prevent sweating. When shells are piled in the open they should not be exposed to the direct rays of the sun.

In the World War, ammunition was arranged in the British service as follows —

i. boxed ammunition;
ii. unboxed ammunition;
iii. trench-warfare ammunition;
iv. miscellaneous ammunition;
v. demolition explosives.

The stacks of ammunition require suitable disposition to minimize risks of explosion by accident or from enemy fire. For safety, distances of 400 yd. may be taken as adequate between categories, and 30 yd. to 100 yd. between stacks of the same category. At base depôts and advanced depôts arrangements for storage of ammunition can be made on more or less semi-permanent lines. From these depôts, ammunition passes to ammunition parks and ammunition columns where the arrangements have to be improvised as local conditions permit. With mobile warfare the movement of parks and columns would prevent any arrangements for storage, separate from the vehicles, of more than a very temporary character, as the principal object would be to deliver, as rapidly as possible, ammunition from the depôts to the particular batteries where it might be most urgently and immediately required.

For trench warfare, the system of "dumps" very naturally came into being, in order that there should be at hand quite a large supply for immediate use, irrespective of the quantity held by an ammunition column. These dumps would be classified according to the nature of the ammunition, and might take the form merely of stacks in the open, separated from each other by traverses of sand-bags and lying at convenient places. For dumps in the rearward area, convenience of transport would determine the locality; while for dumps near gun positions, local circumstances would dictate as to whether the dumps might be actually around the gun positions, or placed a few hundred yards away. (F. M. R.)

**MAGNETISM, TERRESTRIAL** (*see* 17.353).—During 1909–21 further developments occurred in various directions in the study of terrestrial magnetism; and these are dealt with below.

*Instruments.*—The intercomparison of the magnetic instruments of different countries has long had a recognized importance, and a good many comparisons have been effected since the early part of the 20th century, especially by the Department of Terrestrial Magnetism of the Carnegie Institution of Washington. A difficulty increasingly realized is the uncertainty whether any magnetometer can be considered invariable to the degree of accuracy ordinarily aimed at, viz. $1\sqrt{(0{\cdot}00001\ \text{C.G.S.})}$ in force and 0′·1 in direction. Until this difficulty is surmounted the establishment of any international standard would probably be premature. The use of a coil and an electrical current promises greater accuracy for force measurements than the ordinary magnetometer, with less risk of undetected change. Coil instruments for the measurement of H (horizontal force) have accordingly been designed in various countries, including Russia, Japan, Britain and America, but the accuracy attained remains for investigation. An additional reason for the development of an electrical method of measuring H is that the Q term in the deflection formula $2mr^{-3}(1+Pr^{-2}+Qr^{-4})$—where $m$ is the magnetic moment, $r$ the distance—is not really negligible under ordinary conditions. This complicates the observation by requiring three deflection distances, and the apparent changes in P and Q in some instruments raise doubts as to the measure of success attained. An instrument for the direct measurement of the vertical force would possess advantages, especially in high magnetic latitudes.

*Survey.*—Survey work on land and sea has gone on continuously under the auspices of the Carnegie Institution, and many of the results have been published. This work includes a survey of Australia by E. Kidson, and surveys of numerous remote regions in Asia, Africa and South America. Other recent surveys are those of New Zealand by C. Coleridge Farr, Belgium by A. Hermant, and Spain (preliminary) by U. de Azpiazu and R. Gil. There have been re-surveys of the British Isles by G. W. Walker, and of Japan under the general guidance of A. Tanakadate. A survey of India has long been in progress.

*Diurnal Inequality Potential.*—The derivation of the diurnal variation from a potential suggested by A. Schuster has been further considered. Assuming the derivation possible, W. van Bemmelen and S. Chapman have found the part of the potential representing internal forces relatively larger than Schuster did.

A. van Vleuten, examining the hypothesis critically, especially as applicable to quiet-day phenomena, has concluded that the balance of evidence is against it. A difficulty in the way of any general theory of the diurnal variation is the varied influence of disturbance. Not merely is the influence different at different places. At the same place it differs for the several elements, varies according to the season of the year, and is not the same at the same season of different years.

*Eclipse Phenomena.*—Several attempts have been made to ascertain how magnetic phenomena are affected by an eclipse of the sun. No final conclusion has yet been reached, but it seems fairly certain that if an eclipse effect exists, it is small, and probably represents a slight retardation in the changes natural to the hour.

*Sudden Commencements.*—Another inquiry depending on coöperation has been into the simultaneity or non-simultaneity of the so-called "sudden commencements" (S.C.s) of magnetic storms. Several independent investigators have failed to find any certain difference between the times of commencement at remote stations. It has been found, however, that S.C.s differ markedly in type in high and low latitudes, and their apparent duration may differ considerably at different stations. The investigation is complicated by the great difference in sensitiveness and in type exhibited by magnetographs.

*De Bilt "Characters."*—The study of magnetic phenomena has benefited from the international scheme which has had its headquarters since 1906 at De Bilt, Netherlands. Each coöperating station assigns to every day a "character" figure, 0, 1 or 2, according as the day is quiet, moderately disturbed or highly disturbed. The arithmetic means of the figures so assigned are given in the annual De Bilt lists, so that all days have international "character" figures ranging from 0·0 to 2·0. The intercomparison of the "characters" assigned at different stations has confirmed the view that disturbance is seldom, if ever, confined to one area.

*Twenty-seven Day Period.*—The existence of an authoritative international measure of disturbance for individual days has enabled the reality of a "27-day period" in magnetic disturbance to be investigated without any possible prejudice. The phenomenon has been found to exist for quiet as well as for disturbed days. A day which follows a conspicuously disturbed (or quiet) day after an interval of from 26 to 28 days has decidedly more than the average chance of being itself a disturbed (or quiet) day.

*Diurnal Variation.*—Again, comparisons have become possible of the diurnal inequalities in days, undoubtedly representative of quiet and of disturbed conditions. It has been found that in high southern latitudes—and presumably equally in high northern latitudes—the diurnal inequality is exceedingly sensitive to disturbance, and more especially so in winter. For instance, at the station of the Scott Antarctic Expedition in 1911–2 the diurnal inequality derived from the five days of largest international "character" figure in each of the four midwinter months had in each of the elements a range fully four times that of the inequality derived from the international quiet days (five a month). The type of the inequality was in this case but slightly affected by disturbance.

*"Character" v. "Magnetic Activity."*—For these and similar investigations the really important thing is to discriminate between the magnetic conditions on days of the same month or season. For this purpose the existing De Bilt scheme seems eminently satisfactory. But it is otherwise when we wish to compare different years. There is a natural tendency to vary the standard of "character" according as the year is quiet or disturbed. "Character" 1·0 is apt to mean decidedly less disturbance near sunspot minimum than near sunspot maximum. To remove this difficulty, F. Bidlingmaier suggested the use of "Magnetic Activity," defined as the mean value throughout the day of $\frac{1}{3}\pi(\alpha^2+\beta^2+\gamma^2)$ where $\alpha, \beta, \gamma$ represent the departures of the 3 magnetic components from their normal values. Apart from the difficulty of assigning normal values, the amount of labour entailed appears prohibitive. An alternative, suggested by C. Chree, to employ the square of the absolute daily range, or some quantity based thereon, has been tried at Eskdalemuir and De Bilt. It seems fairly workable, but entails sensibly more labour than the "character" scheme.

*Variation of Disturbance with Latitude.*—A comparison of the disturbances recorded in 1911–2 at the Scott Antarctic station with those at various other stations extending from Mauritius to Sitka (Alaska) has shown a marked tendency for disturbance to be simultaneously great in high northern and southern latitudes, and to be less at intermediate stations, whether north or south of the equator. Again, comparison of auroras with magnetic "character" figures, got out for individual hours as well as for individual days, has confirmed the view that an intimate relation exists between aurora and magnetic disturbance. This has long been accepted as true of large magnetic storms and aurora in countries such as England, where both phenomena are rare; but it seems also true of less extreme cases of the phenomena, which abound in high latitudes. The two phenomena at a station in high latitudes do not perhaps as a rule wax and wane together, but if we select a number of days (or hours) when there is bright aurora, the mean magnetic "character" of these days (or hours) is well above the average. It is doubtful whether visible aurora is not the rule rather than the exception in high latitudes. Faint aurora is undoubtedly sometimes seen on days which magnetically are quieter than the average.

*Theory.*—The various phenomena we have referred to—the synchronous occurrence of magnetic disturbance in different parts of the earth, its special development in high latitudes, the enhancement of the regular diurnal variation during disturbance, the association of disturbance with aurora, and the "27-day period"—all accord *in a general way* with the theory pretty generally held that magnetic disturbance and aurora are both due to the emission from the sun of some species of electrical radiation. On the nature of the radiation there is, however, a lack of agreement. Kr. Birkeland, one of the earliest and most eminent supporters of the theory, believed in $\beta$ (negative) rays, possibly of greater velocity than any of artificial origin. C. Störmer, another eminent Norwegian authority, favours $\alpha$ (positive) rays. Difficulties in the way of either theory undiluted have been discussed by A. Schuster, S. Chapman and F. A. Lindemann. One of the chief difficulties is the scattering to be expected from the mutual repulsion of ions all of one sign.

When approaching the earth, ions, whether positive or negative, would naturally spiral round the lines of magnetic force, and so be concentrated in high latitudes. This fits in with the special development of aurora and disturbance in high latitudes, but leaves unexplained the occasional appearance of aurora in latitudes like those of central and southern Europe. The presence of ions should increase the electrical conductivity of the atmosphere, thus enhancing the amplitude of the regular diurnal variation, supposing that due, as is generally believed, to electrical currents in the upper atmosphere. The fact that disturbance enhances the diurnal inequality relatively more in winter than in summer would follow naturally from the very probable hypothesis that ordinary solar radiation itself increases the conductivity of the atmosphere. In high latitudes we may suppose that in winter the electrical currents associated with aurora play the part which in summer is largely played by direct solar radiation.

In the simplified mathematical theory of aurora and magnetic disturbance developed by C. Störmer the earth is treated as magnetized as it would be if only the first order Gaussian harmonic existed. Everything is then symmetrical round the axis of the first harmonic, whose north end according to J. C. Adams was in 1880 at 78° 24′ N. and 68° 4′ W., but moving west through about 0°·1 per annum.

In a theory of magnetic storms S. Chapman also assumes symmetry round an axis regarded as magnetic latitude 90°. He has derived mean results from 40 storms recorded at 12 stations arranged in 5 groups according to magnetic latitude. Confining himself to storms having an S.C., he regards the "general storm" phenomena, *i.e.* the phenomena not dependent on local time, as determined by the "storm time," or time elapsed since the S.C. The phenomena varying with local time he regards as composed of the ordinary diurnal variation + a "local storm variation," determined like the

" general storm " phenomena by the magnetic latitude. He discusses the electrical current systems supposed to " flow in more or less horizontal strata in the upper atmosphere " to which the magnetic changes he has arrived at may be ultimately ascribed. " The external currents will, of course, be accompanied by corresponding induced currents within the earth which will modify their effects." Taking what he considered an average storm, Chapman calculated that it called for the expenditure of energy at the rate of about $2\times10^{18}$ ergs per second for 15 hours.

To many minds theoretical researches of this kind are fascinating, but deductions from them, until confirmed by direct observation, are just as hypothetical as the theories themselves.

A statement of the respects in which there is a lack of uniformity or symmetry in magnetic phenomena may thus be of service in more ways than one. The complete Gaussian analysis indicates in reality a considerable departure from symmetry round an axis. High latitudes, moreover, were practically unrepresented in the data used for calculating the Gaussian constants, while the asymmetry in the positions of the north and south magnetic poles suggests that the result of the analysis may depart most from reality in the very regions where aurora and magnetic storms are most developed. Whatever may be true of a hypothetical aurora or magnetic storm representing the mean of a large number, the individual aurora or magnetic storm shows no approach to symmetry round a magnetic axis. The magnetic disturbance, though universally experienced, seems on a given occasion developed to a very different extent at stations having the same magnetic latitude. Even when there is a recognizable S.C. the sequence of events is widely different at different places, and on different occasions varies much at any one station. In low latitudes the S.C. is a change mainly in H, almost invariably a rise. This enhancement usually persists for a short time, and is then followed by a fall, which brings H below its normal value. But even in low latitudes an oscillation may often be seen in one or more of the elements; while in higher latitudes the S.C. movement is usually oscillatory in all the elements, the first and smaller change in H being a fall. The duration of the enhanced value in H following the S.C. is very variable. Sometimes it lasts five or six hours; sometimes, especially in large storms, a reversal and large drop occur within a minute or two. The superposition, following " storm time," of disturbance curves, unless these be sorted out, may lead to no happier results than the superposition of measurements taken from animals varying promiscuously from a giraffe to a whale. The result *may* be to give us a storm such as never existed. The average intensity even of magnetic disturbance must depend on other things than the magnetic latitude as defined by Chapman. According to this definition Agincourt (Toronto) and Kew are very similarly situated, but during 1911–2 disturbance was almost invariably much larger at Agincourt than at Kew. Again, the relative amplitude of magnetic oscillations at stations so comparatively near together as Kew, Stonyhurst and Eskdalemuir depends on the season of the year, and is considerably different in different years. Chapman's estimate of the energy of a magnetic storm depends fundamentally on several assumptions, the degree of probability of which is at present entirely a matter of opinion. But the estimate is at all events enormously less improbable than that made in 1892 by Lord Kelvin, on the hypothesis of direct magnetic action between the sun and the earth. Kelvin's numerical figure is nearly the square of Chapman's. Before another 30 years have elapsed magnetic phenomena may have been sufficiently investigated to admit of a really satisfactory comparison of theory and observation, but at present that stage has not been reached.

**MAHAFFY, SIR JOHN PENTLAND** (1839–1919), Irish classical scholar (*see* 17.394). He became vice-provost of Trinity College, Dublin, in 1913 and succeeded Dr. Traill as provost in 1914. His provostship covered an eventful period in the history of Ireland and of the college, and Dr. Mahaffy took an active part in the questions which agitated the country. He was a vigorous supporter of the cause of the Allies in the World War, and encouraged the loyal effort of the college, which sent practically all its young men who were eligible for service to the front. Though a strong Unionist by conviction, he believed that the conditions after the rebellion of 1916 necessitated compromise. At his invitation the Irish Convention met in Trinity College in 1917, and Dr. Mahaffy, who was one of the members nominated by the Government, took an active part in the debates. He pressed for a solution of the Irish question on the lines of Swiss federalism, and embodied his views in a minority report which was signed also by Dr. Crozier, Protestant Archbishop of Armagh. In recognition of the services of the college during the war, Dr. Mahaffy was in 1918 made a G.B.E., the Lord Lieutenant, Visct. French, at the same time giving him the accolade. Dr. Mahaffy was thus the first Priest in Holy Orders to be made a knight. Dr. Mahaffy held many foreign and other distinctions; he was a D.C.L. of Oxford, an LL.D. of St. Andrew's, a Ph.D. of Louvain and a Ph.D. of Athens, as well as a corresponding member of several foreign learned societies. From 1911 to 1916 he was president of the Royal Irish Academy. He died April 30 1919.

**MAHAN, ALFRED THAYER** (1840–1914), American naval officer and historian (*see* 17.394), died in Washington, D.C., Dec. 1 1914. His later works included *The Interest of America in International Conditions* (1910); *Naval Strategy Compared and Contrasted with the Principles of Military Operations on Land* (1911, lectures delivered at the U.S. Naval War College, Newport, R.I., between 1887 and 1911); *Armaments and Arbitration* (1912) and *The Major Operations of the Navies in the War of American Independence* (1913).

See C. Carlisle Taylor, *The Life of Admiral Mahan* (1921).

**MAHOMMED V.** (1844–1918), Sultan of Turkey, was born at Topkapu Nov. 3 1844, a younger son of the Sultan 'Abdul Mejid (1822–1861). He led a quiet and retired life, and suffered at times considerably from the jealousy and suspicion of his elder brother, the Sultan 'Abdul Hamid II. On the deposition of 'Abdul Hamid he was invested as caliph (April 27 1909). He was for the most part merely a tool in the hands of the Committee of Union and Progress, and though he was supposed to dislike the pro-German policy of Enver Pasha, he was unable to take any effective steps to oppose him. He died at Yildiz July 3 1918, and was succeeded by his brother Vahid-ed-Din (b. 1861), who took the title of Mahommed VI.

**MAINE** (*see* 17.434).—The pop. of the state in 1920 was 768,014, in 1910 742,371, an increase of only 3·5%, as compared with 14·9% for the United States in the same period and 6·9% for Maine in the previous decade. There was a significant increase in urban population. The proportion living in places of 2,500 or more was 33·5% in 1900, 35·3% in 1910 and 39% in 1920. In 1910 the rural pop. was 480,123; in 1920, 468,445. The only one of the 16 counties showing a marked increase in rural pop. was Aroostook, which is one of the richest farming regions of New England.

The principal cities of the state, with their pop. of 1920 and rate of increase, were as follows:—

| City | 1920 | 1910 | Increase per cent. |
|---|---|---|---|
| Portland | 69,272 | 58,571 | 18·3 |
| Lewiston | 31,791 | 26,247 | 21·1 |
| Bangor | 25,978 | 24,803 | 4·7 |
| Biddeford | 18,008 | 17,079 | 5·4 |
| Auburn | 16,985 | 15,064 | 12·8 |
| Bath | 14,731 | 9,396 | 56·8 |
| Augusta | 14,114 | 13,211 | 6·8 |
| Waterville | 13,351 | 11,458 | 16·5 |

Of these cities Bath showed the largest increase, 56·8%, due to the shipbuilding activity in the World War period.

*Agriculture.*—According to the census of 1920 the number of farms in Maine was 48,227 as compared with 60,016 in 1910 and 59,299 in 1900. In 1920 28·4% of the land area was in farms as compared with 32·9% in 1910. There was, however, a large increase in the value of all farm property: $270,526,733 in 1920 as against $199,271,998 in 1910. A large proportion of the farmers, 94·2%, owned their farms. On Jan. 1 1920 there were 226,997 cows and heifers one year old and over as against 174,794 on April 15 1910. The receipt from sales of dairy products increased from $6,722,779 in 1909 to $15,543,524, or 131·2%, in 1919. Hay still leads other crops: 1,326,289 tons in 1919 as against 1,113,390 in 1909. Potatoes showed a decrease of 10·6% in amount but the value increased 411·9% from $10,224,714 in 1909 to $52,339,514 in 1919. Aroostook county has been very prosperous.

*Forests and Lumber.*—In 1909 an Act was passed by the Legislature creating a Maine Forestry Division, and providing for protection against forest fires therein. The area of this district is estimated at 9,500,000 acres. The forests outside the district contain about 4,500,000 acres. The average yearly cut along the Penobscot alone is more than 150,000,000 ft. b.m. Maine stands second only to New York in the manufacture of pulp and paper, and was first in the year 1916. Two great industries flourish in Maine on account of its rich possession of fine white birch—spool making and the wood novelty business. The International Paper Co. has developed Rumford Falls from a straggling village to a lively progressive town whose pop. has increased from 3,770 in 1900 to 8,576 in 1920. Millinocket, the centre of the Great Northern Paper Co., has also been made among the most progressive of new towns.

*Shipbuilding and Fisheries.*—The World War revived what was once a great industry in Maine, shipbuilding. Up to 1900 more than half the ocean vessels of the nation were built in Maine, but in 1916 only about 10,000 tons of merchant shipping was launched in the state. In 1917 over 40,000 tons was completed and in 1918 over 80,000 tons. The revival of the industry made Bath a boom town and also affected other coast towns, particularly Rockland, Camden, Belfast and Stockton. Maine lost the first American ship sunk by the Germans, the "William P. Frye," built and owned by Arthur Sewell & Co., destroyed by the German cruiser "Prinz Eitel Friedrich" Jan. 28 1915. Maine in 1918 appropriated over $30,000 for the protection and development of the fishing industry. The state department maintains 11 fish hatcheries, chiefly for stocking the inland waters of the state with salmon and trout. In 1909 the Labour Bureau in a careful investigation estimated that 400,000 visitors from other states came to Maine annually to fish, hunt or spend their vacations.

*Manufactures.*—In 1920 there were 16 mills in the state devoted to the manufacture of cotton goods. In 1917 the total value of the product was $29,239,167. In the same year there were 58 woollen-mills employing 8,440 workers. The cotton-mills occupy the large sources of power on the main rivers, while the woollen-mills located on the smaller streams are more scattered. In the 10 years ending with 1920 there have been no unusual developments in manufacturing except for an increasing realization on the part of the people of the value of water-power, and a good deal of political and industrial agitation has arisen on that question. The organization of the state Chamber of Commerce and Agricultural League in 1919 is an important landmark in the industrial history of the state.

*Administration and Finance.*—Since 1910 there have been adopted 10 amendments to the state constitution. The most important of these provide for the permanent establishment of Augusta as the state capital; for the issuing of bonds for the building and maintenance of state highways; for the issuing of bonds for a state pier and for the limitation of the state debt. The bonded debt of the state increased from only $698,000 in 1909 to $6,273,000 in 1917 and to $8,902,300 on Dec. 31 1920. This increase was largely due to highway construction.

*Education.*—Maine has enacted much progressive legislation for education; but on account of her large area and scattered rural population the problem of giving educational advantages to all the children is one of unusual difficulty. Much progress has been made by the abandonment of the small, weak school of less than eight pupils and the centralization of schools by the transportation of the children. But transportation in the rigorous winters and over the country roads in the springtime is not easy. The state Department of Education has endeavoured by a wise system of subsidies to build up the rural schools and has provided for such teachers special inducements. Maine had (1920) 228,489 inhabitants between the ages of 5 and 21; and of these 131,313 were enrolled in the elementary schools and 23,291 in the secondary schools, high schools and academies. The state has done much to advance vocational training through legislation that gives assistance to towns for courses in manual training, domestic science and agriculture.

*History.*—In Jan. 1911 Frederick W. Plaisted was inaugurated governor, the first Democrat to hold that office since 1880. The same month Charles F. Johnson, of Waterville, a Democrat, was chosen U.S. senator; and in Sept. another Democrat, Obadiah Gardner, of Rockland, was appointed senator. This was the first time since the Civil War that the Democrats had held these three major offices. In Sept. 1911 the state voted on the repeal of the prohibitory amendment to the constitution; in an extraordinary vote the amendment was retained by 60,853 votes to 60,095. The surprisingly large vote for repeal was due in large measure to the disgust of the voters at the lax enforcement of the law. It is interesting to note that this large vote against prohibition in the state of Neal Dow came only a few years before the adoption of national prohibition. At the same election a law which applied the direct primary to all candidates for state and county office was passed. In the Nov. election of 1912 Woodrow Wilson won the electoral vote of Maine by reason of the split in the Republican ranks between Taft and Roosevelt. In 1916 the split was healed, and Maine has since that time run true to form as a Republican state. In 1917 the Legislature was much concerned with the question of water-power, and under the leadership of Percival P. Baxter, of Portland (afterwards governor), refused to allow the transmission of power outside of the state. In Sept. 1917 in a referendum woman suffrage was overwhelmingly defeated, 38,838 voting "No" and 20,604 voting "Yes."

Maine took an active part in the World War, being the first in the Union in the number of volunteers in the army and navy in proportion to population, and the second state to organize a committee of public safety. Up to Dec. 31 1917 over 10,000 men had volunteered. The first drafted man to reach a Federal camp was from Princeton, Maine. Maine was throughout the struggle distinguished for the unity and whole-heartedness of her support, as in the few months after the war she was distinguished for having no radical agitation and no arrests of Reds.

In Jan. 1921 Maine had three governors, Carl E. Milliken until the inauguration of Frederic H. Parkhurst Jan. 6, who served until his sudden death on Jan. 31, when he was automatically and immediately succeeded by Percival P. Baxter, of Portland, the president of the Senate. Governors since 1911: Frederick W. Plaisted, Dem., 1911; William T. Haines, Rep., 1913; Oakley C. Curtis, Dem., 1915; Carl E. Milliken, Rep., 1917; Frederic H. Parkhurst, Rep., 1921; Percival P. Baxter (acting), Rep., 1921.

(K. C. M. S.)

**MALABARI, BEHRAMJI** (1853–1912), Indian journalist and social reformer (*see* 17.453), died at Bandora, near Bombay, July 12 1912. Up to the time of his death he continued to edit the monthly periodical *East and West*, and he wielded remarkable influence with a long succession of viceroys, governors and heads of departments in India, as well as originating various philanthropic enterprises.

See biographies by Payaram Giduma (1891) and Sirdar Jogendra Singh (1914).

**MALARIA** (*see* 17.461).—The discovery that this disease—perhaps the most widely spread of all human diseases in warm countries—is carried from man to man by certain species of mosquitoes was made in 1897–99, and gave a great stimulus to the study of tropical diseases, both of men and of animals, in general. Schools of tropical medicine were formed in consequence, in most of the larger countries of the world, where medical men could obtain instruction regarding the new knowledge; societies of tropical medicine and special journals were founded everywhere; the British Colonial Office established a Tropical Diseases Bureau and an Entomological Bureau which publish frequent admirable abstracts of new literature on these subjects; and the whole of tropical sanitation was powerfully affected—though perhaps not quite as decisively as it should have been. Nevertheless, as regards malaria, it cannot be said that the results have been so great as were hoped for. Except for the identification, classification and study of mosquitoes (*Culicidae*) all over the world—based chiefly on F. V. Theobald's monumental book on the subject—and except for numerous local labours of verification, nothing of fundamental value has been added to the knowledge which we possessed at the beginning of the present century. The reason for this has been partly that the attention of investigators was largely diverted to other diseases which had not then been so minutely examined—especially sleeping sickness,

yellow fever, Leishmaniasis, and various forms of relapsing fever; but also partly due to absence of that persistent individual effort which alone is capable of solving the difficult problems of science. There has been no encouragement of such effort, and even little coördination of the slighter researches which are always being carried on in various countries. Many important questions therefore still remain unanswered; and if it had not been for the exigencies of the World War there would have been little now to add to what was available up to 1910. Certainly innumerable papers have been published; but in some cases the writers are evidently unacquainted with more than a tithe of the enormous literature; in others they mistake speculation for proof; and in nearly all they discontinue their efforts before reaching definite conclusions.

Similarly, the prevention of malaria on the large scale, which was rendered possible or even easy (in many places) by the new knowledge, has not been carried out as generally as was hoped at the beginning of the century. The classical successes obtained at Ismailia and in the Federated Malay States, in Italy, and at Havana, Hong-Kong, Khartum, and elsewhere do not seem to have encouraged the same kind of work in other localities—excepting the long-continued labour of M. Watson in the Federated Malay States and the brilliant sanitary victory of General Gorgas and the Americans, over both malaria and yellow fever, at Panama. The method of mosquito-reduction against malaria was first suggested and tried by a band of volunteer British workers in Freetown, Sierra Leone, in 1899, when full details of the method were published by them; but the work at Panama was on such a large scale and was so logically and thoroughly done that it set an example which we can only regret has not been more widely followed. The reasons for this are that local authorities always dislike spending money on sanitation and that local sanitary officers seldom possess much influence—or exercise it if they do possess it. For a long time also such practical efforts were much hampered by a school of writers who pleased the authorities by arguing that mosquitoes are irreducible, and that it is better to prevent malaria by quinine or by the use of mosquito-nets, and so on—the truth being that local conditions must always determine the kind of prophylaxis which it is best to adopt. The history and details of all this will be found in *The Prevention of Malaria* (1911), by Sir Ronald Ross, with chapters by A. Celli, W. C. Gorgas, M. Watson, A. Balfour, and others.

Until the war spread to the eastern fronts British armies suffered little from tropical diseases; but then the Empire was compelled to pay dearly indeed for its neglect of investigation of these diseases in the past. In 1915 a terrible epidemic of dysentery, both bacillary and amoebic, afflicted the forces in the Dardanelles and contributed largely to the failure of that expedition. In the summer of 1916 a similar epidemic of malaria occurred among the troops on the Salonika front and continued until the end of the war. Apart from the numerous ship-loads of men invalided to Egypt, Malta, and Britain for these diseases, twenty-five thousand men had to be repatriated from Salonika during the height of the war for general disability caused by malaria. Both malaria and dysentery caused havoc among the forces in German East Africa and, perhaps to a less extent, among the forces in Mesopotamia. Not only did this sickness cripple the armies during the struggle, but it has left a legacy of relapses, both of malaria and of dysentery, which are now being heavily paid for by the British taxpayer in the form of pensions and medical treatment.

Towards the end of the earlier article it was remarked that "recent discoveries have done little or nothing for treatment. Quinine still remains the one specific." This was true in 1910, and it is this fact which has cost the British taxpayer so much. But our ignorance was deeper than is implied in the quotation; for, although we knew that quinine is the specific for malaria, we did not know exactly how it should be used to the best advantage. Malaria is preëminently a disease which continues to relapse for months and years after a single infection by the mosquito, wherever the patient may be, however he may live, and in spite of quinine treatment as it is usually given. We knew that quinine in almost any doses from twenty to forty grains daily, or even less than this, was generally sufficient to control actual attacks of fever in two to four days, and to do so almost with certainty; but we did not know what dosage to use for the purpose of extirpating the infection, nor the nature of these relapses.

Numerous speculations had been advanced as to their nature. Some thought that the parasites enter upon a resting-stage somewhere within the tissues during the fever-free intervals. F. Schaudinn proposed as a hypothesis that the sexual parasites, which generally are not concerned with the patient's fever, suddenly begin to produce spores asexually when a relapse occurs; but the evidence which he gave for this view did not bear careful examination. Sir Ronald Ross, however, had always held that the parasites continue to breed in the blood during the "rallies" just as they breed during the "relapses," except that in the former their numbers are too small to produce a febrile reaction. He had also long been much concerned regarding the defects in our knowledge of how to treat these relapses, and, in consequence, commenced researches on these subjects in collaboration with D. Thomson at Liverpool. The result was that, as he had anticipated, the parasites were found to be present in the blood in very small numbers during the rallies and to multiply greatly during the relapses. The number required to produce an attack of fever was roughly about 250 millions (a man contains about three million cubic millimetres of blood); but during a rally the numbers fall to a very few per cubic millimetre, while during a relapse the numbers may reach a total of many thousands of millions or may even exceed one million millions. This suggested that the proper way to extirpate the infection entirely was to give quinine constantly over a long period until the last parasite had been destroyed; but the material at Liverpool did not provide cases suitable for trial of this thesis—so that when the war broke out we were still ignorant regarding it.

When the outbreak of malaria at Salonika occurred in 1916 Sir Alfred Keogh, the director-general, Army Medical Services, at once endeavoured to cope with the situation; and early in 1917 he appointed a special malaria hospital in each Command in the United Kingdom for the express purpose of investigating these questions, of finding a permanent cure if possible, and of treating the thousands of men who were being returned home sick with malaria from the eastern fronts, Sir Ronald Ross being also appointed Consultant in Malaria at the War Office. Many of the results will be found in the War Office publication: *Observations on Malaria by the Medical Officers of the Army and Others* (War Office, Dec. 1919). The fact, mentioned above, that moderate doses of quinine will control actual attacks within a few days was fully verified, and with very few exceptions; but it was quite otherwise with the complete extirpation of the infection which was so urgently required. Almost every form of treatment that had ever been suggested—enormous doses of quinine reaching one hundred grains *per diem*, smaller doses continued for three weeks or more; additional medication with arsenic and other drugs; continuous doses lasting for a month, and various kinds of interrupted dosage—all proved quite uncertain. Thirty grains of quinine continued every day for three weeks proved a bad failure. Intramuscular injections and even intravenous injections did no better; and the result was that men who were presumed to be cured relapsed again in a month or two after returning to duty, while those who remained apparently well even for some months relapsed later on. That is to say, a large proportion of the men who had once been infected with malaria became almost useless for further service—though certainly a few cases appeared to have been finally cured. It should be added that numerous nostrums advocated for malaria proved incapable not only of checking relapses but also of influencing the number of parasites present during fever; the only exceptions being one or two arsenical preparations, which, however, certainly proved no *better* than ordinary quinine.

In all these attempts, be it noted, treatment had seldom been continued for more than one month and seldom or never for more than two months—owing, of course, to military exigencies. But after the Armistice, when we were called upon to deal with large numbers of discharged soldiers, a longer period of treatment was decided upon. In 1918 two whole divisions, full of malaria, had been brought from Salonika to France and were there subjected to a longer course of treatment preparatory to their being sent again into the firing-line. The regiments arrived in an extremely bad condition, but were all placed in camps in the Dieppe region, and the men were there given 15 grains of quinine in solution once daily for a fortnight, followed by 10 grains of quinine in solution daily for two and a half months more. The course, which was designed by Col. J. Dalrymple, was carried out most strictly under his supervision, and had marvellous results, almost the whole of the two divisions being found fit for the front at the end of the three months. About the same time large malaria concentration-camps were established in England, where cases were given similar treatment but for shorter periods; and it was found generally that:— (1) doses of less than 10 grains daily did not suffice to prevent relapses even while they were being taken; (2) doses of 10 grains daily did suffice to prevent relapses while the doses were being taken, except in about 6% of the cases, most of whom, however, relapsed during the first few days of the treatment; (3) 15 grains a day reduced the relapses still further, but only to about 4% or 5%.

The long-continued treatment of malaria had been advocated previously; but it was now proved to be so satisfactory that the authorities decided to apply it to pensioners also. In Oct. 1919 the Ministry of Pensions established large clinics for tropical diseases; and the three-months' course was given as a routine to the malaria

cases. In one London clinic alone nearly 30,000 pensioners have been treated in this way. The results have been admirable, and probably very few men who have taken the treatment properly have returned. But the 10 grains of quinine must be taken religiously every day. The explanation of this success is that each dose of quinine makes a small reduction in the number of the parasites present; and that this reduction occurs every day until finally none of the *Plasmodia* are left. An easy calculation shows that the curve of the fall in the number of *Plasmodia* must be a logarithmic curve—so that the treatment must be continued for a long time in order to reduce to none the vast numbers of the parasites found during the attack. Empirically, three months appear to be enough, but in obstinate cases or in very early ones four months might be better.

Many experiments were made during the war with a view to ascertaining whether *larger doses* of quinine administered less frequently would not be as satisfactory as the 10 grains administered daily. Thirty grains given two days a week and 20 grains given three days a week yielded good results, but any dosage under a total of 60 grains a week proved insufficient; and, in fact, the daily small dose is more easily and therefore more certainly taken by patients (out of hospital) than the larger occasional dose, which causes more dyspepsia and headache and is therefore frequently postponed.

Other salts of quinine besides the sulphate were tried. The hydrochloride and bihydrochloride affect the digestion less and seem to be as satisfactory; the tannate has been much used in Italy, especially for prophylaxis among children; and various other salts have been commended from time to time. Cinchona bark contains many alkaloids besides quinine and many of these were on trial for a long time, especially at the malaria depot, Dagshai, India, where Maj. H. W. Acton obtained the best results for the benign tertian parasite with cinchonidine and quinidine and with the mixture called "cinchona febrifuge." But further investigations are still required.

The fact that relapses are banished or largely reduced while quinine is actually being taken in sufficient amount is now seen to account, at least partially, for the supposed good effect of "quinine prophylaxis"—clearly, if relapses are rendered less frequent, the total number of attacks registered in the malaria returns will be smaller. But this does not prove that persons cannot become infected while they are taking, say, 10 grains of quinine daily—which is the true meaning of the term "quinine prophylaxis." In Salonika it was frequently found that bodies of men who were given as much as 30 grains daily as a prophylactic remained free from attacks while they were taking the drug but "went down" with malaria as soon as they stopped it—showing that they had been infected in spite of it. Much dissatisfaction was felt at these results; but probably they would have been more successful if the medication had been continued longer—long enough to eradicate the infection *if acquired*. Sir Ronald Ross has therefore always felt that, to be effective, quinine prophylaxis should be continued in 10-grain doses daily for three months after a subject has left the malarious locality. There is also much to be said for the view that quinine prophylaxis breaks the initial force of an infection when it does occur. But, from the results obtained at the malaria centres and camps during the war, any dosage under 10 grains daily for an adult is scarcely likely to be useful (children can be given a larger proportion by body-weight—say twice as much). These conclusions have been strongly confirmed by the work of Ed. and Et. Sergent on the malaria of birds.

Many researches have been made regarding the absorption and elimination of quinine. Before the war the chemists laid down that it is absorbed less readily—and not more readily as clinicians seemed to think—from intramuscular injections than when given by the mouth; but this view was not supported by investigations carried out during the war. Many clinicians, especially in Mesopotamia, strongly advocated intravenous injections in serious cases, but analysis of their arguments does not beget complete confidence in their views. According to classical Italian work quinine destroys only the young *Plasmodia*—so that 48 hours or more may elapse before its good effects become manifest. The impatient clinician is therefore often tempted to think that the orally-administered quinine has been a failure and to resort to an intravenous injection just at the moment when the former begins to act—and so, of course, attributes the benefit to the injection. Injections must be given in certain cases; but the very large experience obtained in the home hospitals suggested that there is really very little difference in the values of the various kinds of quinine-administration in ordinary cases. There is also now reason for thinking that very large doses of quinine are resisted by the blood and eliminated more quickly than more moderate doses, and may therefore actually have less effect.

The prevention of malaria on the battle-front was always difficult and sometimes impossible. Mosquito-reduction in the face of enemy fire is impracticable; quinine prophylaxis was, as stated, disappointing; and the armies were obliged to fall back upon mosquito-nets and mosquito-proof tents and bivouac shelters—which were carefully designed by the British War Office. Better results were obtained at the bases of operations, especially in Palestine; and a very successful campaign of mosquito-reduction was carried out by Col. J. C. Robertson at Taranto in southern Italy. Apart from the war, the American Rockefeller Foundation, various authorities in Italy, South America, and elsewhere, and the planters in the Malay States have done similar useful work.

Even long courses of treatment will not necessarily cure people who are subject to re-infection while taking the courses; and it is even possible that they are not so effective during the first six months or the first year of infection as they are later. It must be remembered that the results advocated above were obtained among returned cases in Britain. In old cases the parasites are not easily found in the blood except while a relapse is occurring; but it must not be inferred that they are entirely absent in such cases simply because they cannot be detected in the minute quantity of blood usually examined by the pathologist; and the statement sometimes made that cases which do not show the parasites in the blood are no longer infected, may be for this reason quite untrue. Many detailed investigations of the parasites themselves, of their presence in various organs, and of the pathology of the disease have been made during the last ten years, but have not given new results of any great importance. The definite objective diagnosis of chronic malaria among out-patients still remains difficult in spite of various methods which have been advocated, especially by foreign observers. Lastly it may be mentioned that the mathematical theory of the distribution both of mosquitoes in localities and of the occurrence of cases of malaria from time to time has been worked out by Sir R. Ross and by Prof. Karl Pearson. (R. Ro.)

**MALAY STATES, FEDERATED** (*see* 17.478).—This territory enjoyed a notable immunity from sufferings entailed by the World War, and was able to make substantial contributions in money and armaments toward the needs of the British Empire. The pop. in 1919 was estimated at 1,315,700; the birth-rate was 24·57 and the death-rate 29·37 per thousand. In 1918 the influenza epidemic caused 5,643 deaths. Malaria is by far the most deadly disease normally; the death-rate from this was 12·9 per thousand in 1919, but a slight reduction is apparent, and the work of the special malaria bureau is extending.

The estimated pop. of the several states was: Perak, 622,403; Selangor, 391,103; Negri Sembilan, 156,679; Pahang, 145,515. The chief towns had populations as follows according to the census of 1911: Kuala Lumpor (Selangor), 46,718; Ipoh, 23,978; Taiping, 19,556; Kampar, 11,604 (all in Perak); Seremban (Negri Sembilan), 8,667; Kuala Kuantan (Pahang), 2,102. The pop. in 1911 included the following nationalities: Europeans and Americans, 3,284; Eurasians, 2,649; Chinese, 433,244; Malays, 420,840; Indians, 172,465; Japanese, 2,029. Out of the total number of labourers on estates, 237,128 in 1919, 160,657 were Indians. Of these, 59,154 came from India on free passage during the year, out of a total of 71,000 Indian immigrants in all. Chinese immigrants numbered 25,816, and emigrants 26,033. The activities of a Chinese Bolshevist society working from headquarters at Canton were revealed among the trade guilds, and many labourers were induced to limit their output. The Chinese Triad societies continued to cause trouble in various directions of organized crime such as robbery and blackmail. Serious crimes numbered 1,002 in 1919 and 821 in 1918; gang robberies were especially numerous in Kinta (Perak) until two powerful robber bands were broken up in 1919. In that year 469 persons were banished, 400 being Chinese. The police numbered 87 British and 3,479 Asiatics.

In 1919 important movements for the extension of education were set on foot, despite difficulties encountered in increasing the number of teachers and the improvement of the teaching standard. A new training college for teachers was established at Tanjong Malim. A temporary scholarship scheme for sending teachers to Hong-Kong University was set on foot, to serve until more training colleges were established and pending the opening of Raffles College, founded in Singapore. In 1919 there were 533 schools, with an average attendance of 27,325.

Revenue amounted in 1919 to $72,135,075 ($=2s. 4d.), the principal sources being customs ($18,024,762), licences, etc. ($17,921,677) and railways ($14,957,460). Expenditure amounted to $70,676,961, the largest item being upon railways ($26,421,822). The expenditure of the agricultural department was $558,156 and the revenue $266,360. Important researches were made on the deterioration of rubber in storage, which was found to be due mainly to surface oxidation, from which it is indicated that the slab form is preferable to the crêped form for storage. The mouldy rot disease (in Negri Sembilan) and the brown bast disease were further investigated. A Government experimental coco-nut plantation has been started. The forest department had in 1919 a surplus of revenue amounting to $490,877, and over 10 per cent of the total area of the states is in reserved forest. The commercial timbers of the country are in process of being scientifically investigated, and the distillation of native woods has also been made a subject of research.

The mines of the territory employed 213,107 hands in 1919. Revenues from mining, exclusive of special war taxes, amounted to $10,489,185. Tin was exported to the amount of 620,618 piculs (of 133⅓ lb.), and the average price per picul was $120.68, as against $150.62 in the preceding year. In the early part of 1919 tin was unsalable locally, and the Government bought from the local mines pending the reestablishment of the market, the subsequent sales realizing nearly $1,000,000 profit. Other minerals were produced as

follows: tungsten ores, 7,323 piculs (exported); coal, 191,293 tons; gold, 16,402 oz., of which all but 1,096 oz. was from the Raub mine.

The total value of exports in 1919 was $279,135,105 (from Perak, $124,733,232; Selangor, $100,848,202; Negri Sembilan, $42,289,333; Pahang, $11,264,338), the principal articles, in addition to the minerals already mentioned, being rubber and copra. Imports in the same year were valued at $118,854,965. One thousand one hundred and twenty-two merchant vessels, including 197 ocean-going steamers, called at Port Swettenham, over 97% being British. There were 949 m. of railway with 212 stations open at the end of 1919. Connexion was established between the Malayan and Siamese railways in 1918, and a service between Singapore and Bangkok was inaugurated, the journey occupying four days. The length of metalled roads in 1919 was 2,362 m. (Perak, 835; Selangor, 763; Negri Sembilan, 420; Pahang, 344); of earth roads, 158 m.; of paths (other than the smallest), 1,791 m.

The telegraph and telephone system was extended by over 800 m. of line between 1910 and 1919, and in the latter year amounted to 2,372 m., in addition to which the postal and telegraph department of the Federated States had 121 m. of line in Johor. (O. J. R. H.)

**MALAY STATES, NON-FEDERATED** (*see* 17.482).—(1) *Johor* (*see* 15.475).—A British general adviser to the Sultan was lent by the Federated Malay States Government in 1910, and other officers of the same service were seconded to conduct Government departments in Johor. In subsequent years the prosperity of the state was greatly enhanced; the administration was improved, roads and railways were extended, and a trigonometrical survey was undertaken. Town boards were created in Johor Bahru, the capital, Bandar Maharani, and Penggaram (Batu Pahat), and effected improvements in sanitation, etc.

With increased prosperity came a great increase in pop.; the pop. according to the census of 1911 was 180,412, but a conservative estimate in 1919 put it at 300,000. In 1919 revenue amounted to $11,002,777 ($=2s. 4d.) and expenditure to $8,223,862, the revenue being almost exactly double, and the expenditure more than double, that in 1915. Imports were valued in 1919 at $29,524,700, and exports at $71,279,930. In 1915, 9,197 tons of rubber were exported; in 1919, 27,890 tons, valued at $53,203,400. Copra, areca nuts, tin, tapioca and gambier were the other chief exports. The development of tin-mining dates almost wholly from 1911; it is carried on principally in two fields, Mersing and Kota Tinggi.

The new educational system of Johor, in which English is taught concurrently with Malay, appears certain of success. In 1919 there were 71 vernacular schools with an average attendance of 3,058, and the attendance at English schools was 693, the chief being the Bukit Zahara school at Johor Bahru, which has been reconstructed.

The state had in 1919 a military force numbering 590; a detachment was employed in the defence of Singapore, 1915–9.

(2) *Kelantan.*—Pop. (1911), 286,751. Revenue (1919), $1,141,444; expenditure, $1,065,012. Exports (1919), $5,467,424; imports $3,876,679. Out of the total exports, rubber represented a value of $3,577,127. The total value of direct trade, or trade other than with the Straits Settlements and Malay States, was $1,847,115, the export trade being almost wholly with the United Kingdom ($641,515), while imports were from that country, the Netherlands, India and Siam.

In 1912 the agreement between the Sultan and the Duff Development Co. was determined, and the Government renewed the sovereign powers previously conceded to the company over nearly two-thirds of the area of the state. The company retained various agricultural and mineral rights, but mining remained almost undeveloped down to 1920. In 1919, however, an agreement was made with Chinese interests for the working of a mineral area in the Nenggiri, and a little tin ore was exported from the Bukit Yong concession in the Kamuning district.

A ferry service between Kota Bharu (capital of Kelantan) and Pekbang was reopened in Sept. 1919.

(3) *Trengganu.*—Pop. (1911), 146,920. In 1918–9, when there was a serious shortage of rice and other food supplies, 3,000 persons were reported to have emigrated from northern Trengganu to Kelantan, and many villages were abandoned.

After the suzerainty of this and other states was transferred to Great Britain by Siam under treaty of 1909, the Sultan of Trengganu only agreed to the appointment of a British agent with the functions of a consular official. In May 1919, however, he agreed to receive a British adviser and to act upon his advice in all matters of finance and general administration, excepting such as touch the Mahommedan religion. The state remains in a backward condition, but this important change of régime was willingly accepted, and presages extensive developments and reform.

Revenue and expenditure in 1915 amounted to $183,723 and $183,470 respectively; in 1919 to $762,455 and $756,977. Revenue was formerly obtained almost wholly from monopolies, but these were retained in 1919 only for gaming, spirits, pawnbroking, and turtle-eggs. This last peculiar monopoly yielded between $5,000 and $6,000. Other former monopolies, such as customs and opium, which were farmed out, yielded greatly enhanced sums under direct Government control.

Complete trade returns for the state are not kept, but imports into the port of Kuala Trengganu were valued at $2,417,645 in 1919, and exports at $1,718,428. Figures for the Singapore-Trengganu trade showed a value of $1,911,014 for imports into Trengganu, and of $3,816,670 for exports. The chief exports were dried fish, tin ore, wolfram ore, copra, Para rubber and silk sarongs. The export of tin ore to Singapore was 10,194 piculs in 1918 and 10,580 in 1919; of wolfram ore 10,368 and 9,408 piculs in the same years. The tin-mining industry, in Kemaman district, is chiefly in European and Chinese hands. Wolfram is worked in the same district and in Dungun; considerable attention has recently been given to prospecting, and extensive deposits of graphite and magnetite have been located. Complaint was made, however, of the corrupt condition of the land department, and the appointment of a European commissioner of lands was urged. Rubber plantations are mainly in Danish hands; the state is not self-supporting in the principal food crops; agricultural development on commercial lines attracts mainly Europeans, Chinese and Japanese; and the fish trade is held by Chinese agents of firms in Singapore. The advance in commercial prosperity it may be observed, has not been conspicuously reflected in improved conditions for the peasantry.

(4) *Kedah.*—Pop., 1911, 245,986; 1919 (est'd), 300,000. The influenza epidemic of 1918–9 was exceptionally severe, notably among Malays and Tamils, but less among the Chinese. Revenue (1919), $4,941,484; expenditure, $4,282,038.

Complete trade returns are wanting, but the chief exports are rubber, tapioca and sago, tin ore, live stock and poultry, and normally rice. But the general shortage of rice in Malayan and adjacent countries in 1918–9 led to such heavy export from Kedah that in Feb. 1919 it was necessary to prohibit export of paddy, and to control the home distribution and milling. The output of tin ore in 1919 was 11,799 piculs, but this represents a decrease, and the known tin-fields were becoming exhausted. In the same year the largest-yielding wolfram workings in the British Malay States, at Sintok, North Kedah, were closed down owing to the fall in price of tungsten. The yield of timber from forests under the forest department was nearly 15,000 tons, but accessible timber was becoming scarce and rising in price, and its want delayed many public works. The export and import of cattle, pigs, sheep and goats continued large though somewhat declining. Cattle and cattle-sales are licensed and registered, and for a better control of the trade with Siam a quarantine station was established for all the British Malay States at Pedang Besar, Perlis. Agricultural estates (of which there were 202 of 100 ac. or more in 1919) employed 35,673 labourers; most of these lands were under rubber cultivation.

The educational system of this state has notably advanced. Two Government English schools were maintained in 1919, at Alor Star and Sungei Patani, with 294 pupils, mostly Malays and Chinese. There were 60 vernacular schools: average attendance 4,867.

The Public Works Department maintained 314 m. of streets, metalled roads, earth roads, and bridlepaths, and 165 m. of canals in North Kedah.

(5) *Perlis.*—Pop., 1911, 32,746; 1919 (est'd), 36,000. Revenue (1919), $294,044; expenditure, $243,885. Copra, tin ore, fish, live stock and paddy were chief exports.

Perlis has not, like other Malay states, neglected its native agricultural pursuits in favour of those of greater commercial value, and it escaped the food shortage common to neighbouring countries in 1918–9. The output of tin ore, 1,896 piculs in 1919, was declining; stream tin appeared to be exhausted, and the revenue from royalties on tin ore declined to $15,897 from $26,948 in 1918. The guano hills had ceased to be worked for export. An outcrop of coal at Bukit Arang has been prospected, but the signs of petroleum had not been exploited in 1921. (O. J. R. H.)

**MALTA** (*see* 17.507).—The constitution, as set forth in the letters patent of June 3 1903, was amended Dec. 30 1909, when two elected members of the Legislative Council were given seats on the Executive Council. For some time previous to 1919 a scheme was being worked out for the further modification of the terms of the constitution. In Sept. 1919 the Under-Secretary of State for the Colonies (Col. Amery) visited Malta and discussed the various projects put forward. On June 12 1920 the governor (Field-Marshal Lord Plumer) communicated the decision of His Majesty's Government to grant a constitution which provided for responsible control by the Maltese of local affairs. The letters patent, promulgated on April 30 1921, came into force on May 16 and provided for the creation of a Senate of 16 members and a Legislative Council of 32–40, elected

on a proportional basis and controlling its own ministers. The Ministry is to consist of not more than 7, representing the Colonial Secretary's office, Justice, the Treasury, Public Works, Agriculture, Industry, and Commerce. Judges are to be appointed by the Government in Council, and can only be removed by a joint address of the Legislature.

Each House will make its own standing orders and rules and define its privileges, such powers, however, not to exceed those of the British House of Commons. Debates may be conducted in English, Italian or Maltese, but all official entries must be in English only. All persons inhabiting the colony are to have full religious liberty. No person is to be subjected to any disability or exclusion from office on the ground of religion. (A covering despatch suggested that the Legislature, at its first sitting, should declare Roman Catholicism the State religion.) English is to be the official language of the colony, but English and Italian are to be recognized as equal languages of culture, and Maltese is to be allowed in the elementary schools. Italian is to be the official language of record in the law courts, but not only English people but any person who is not Maltese may claim to be tried in the English language.

By the new letters patent the power to make laws regarding "reserved matters"—including everything pertaining to defence, the control of the naval, military and air forces, wireless, territorial waters, imperial property and interests, external trade, coinage, immigration, naturalization, treaties and relations with foreign states—remains in the hands of the governor and commander-in-chief assisted by a nominated council consisting of the lieutenant-governor and a legal adviser as *ex officio* members, and an officer of the navy, army and air force. Legislation by order in council is abolished.

The civil pop. on April 1 1920, including Gozo (*see* 12.305) and Comino, was estimated at 224,859 as compared with 211,864 according to the census of April 2 1911. The death-rate in 1918–9, when influenza was rife, rose to 26·3 per 1,000 as against an average of 22·9 during 1910–20. The more rigorous sanitary measures imposed since 1910 and the enforced observation of flocks—341 sheep and goats infected with undulant fever were destroyed in 1919–20—have contributed to raising the general standard of health.

Critical economic conditions manifested themselves after the cessation of war activities. The number of unemployed was swollen in 1919 by the discharge of about 15,000 men from the naval and military establishments, and an emigration committee was perforce established to investigate the most suitable outlets for Maltese labour and to assist emigration in every possible way. The number of emigrants in 1919–20 reached the high total of 5,600, of whom 700 secured employment on reconstruction work in France, and over 2,000, chiefly skilled artisans, attracted by high wages, went to the United States, and 1,268 were awaiting passports on March 31 1920. The distress prevailing among the poorer classes compelled the authorities to continue the bread subsidy in 1920, and a Grant in Aid of £250,000 was made by the Imperial Government to this end. General want and discontent, however, led to serious disorders, and in June 1920 considerable damage, including the burning of a flour-mill, was done to property.

On Aug. 31 1919 the number of Government day schools was 121 (102 Malta and 19 Gozo), with a total of 20,291 scholars; pupils attending secondary schools numbered 765. In Sept. 1919 the minimum age for admission was fixed at the age of six years. The total expenditure for the year on elementary education was £45,374.

During 1918–20 further archaeological investigation of the prehistoric temple at Tarxien was pursued; wall tombs of the Punic and Roman periods were discovered near Rabat; and a number of prehistoric cart tracks were discovered and mapped in the north-west of the island. Palaeontological investigations were also continued, and excavations at the cave of Ghar Dalam yielded important results, among which were the discovery of human teeth assigned to the Neanderthal period and remains of hippopotami and elephants.

The revenue for 1919–20 was £650,489 and expenditure £632,233, as against £463,002 and £416,389 in 1915–6. Expenditure in 1919–20 did not include £160,764 paid as bread subsidy, which was charged to the grant from the Imperial exchequer. Customs dues are the chief source of revenue (£252,822 in 1918–19). The amount of British Treasury paper currency notes in circulation on March 31 1920 was estimated at £886,000.

The total area of land under crops in 1919–20 was 42,850 ac., of which 20,498 were under cereals, 10,569 green fodder, 2,752 potatoes, 2,295 beans and pulse, 920 onions, 630 cotton, and 206 cumin. The existence of phylloxera in the vineyards of Gozo was discovered during the year, and immediate measures were taken to deal with the danger; American immune vines were obtained and nurseries established in Malta.

The trade (inclusive of goods by parcel post, but exclusive of bullion and goods in transit) was as follows:—

| | 1913–4 | 1919–20 |
|---|---|---|
| Imports | £2,589,272 | £4,261,745 |
| Exports | 1,154,363 | 918,588 |
| Total | £3,743,635 | £5,180,333 |

Of imports in 1919–20, 54% were from the United Kingdom. The number of British steamers calling (not including war-vessels and transports) was 489 of aggregate tonnage 1,292,755, and of foreign vessels 386 of 583,528 tonnage.

**MANCHESTER**, England (*see* 17.544).—Pop. (1911) 714,333. The most important changes in local government have been the bringing of the city entirely under one Board of Guardians (1915), and one Board of Overseers (1916). The area of the city was slightly increased (1913) and a rearrangement of wards (1919) somewhat reduced the representation of the central business wards. Among the important schemes completed or in progress are the completion of the third pipe (1915), and commencement of the fourth pipe, from the Thirlmere water-works; the acquisition of Haweswater for additional water-supply (1921), and the purchase of the North Cheshire Water Co.'s undertaking (1921); the South Manchester town-planning scheme, giving new outlets on the Cheshire side, and housing schemes involving a total expenditure of £6,448,102; a main drainage scheme (1911–21); the purchase of the Stretford gas-works (1921); the erection of an electricity generating station at Barton-on-Irwell; the purchase of the historic Free Trade hall (1921); the Town Hall extension scheme (1921), which will include a new central library; and work in connexion with Abergele sanatorium (1921) to cost nearly £500,000.

Manchester's progress during 1911–21 was marked by the growth of a new warehouse district in the neighbourhood of Whitworth Street; by the erection of numerous chemical and engineering works, many of them in Trafford Park just beyond the city boundary; and by the development of a university quarter, with the principal hospitals in the neighbourhood. Two well-known buildings have been taken down: the reference library (formerly the Town Hall), King Street, replaced by Lloyd's Bank; and the Royal Infirmary, Piccadilly, the site now being occupied by a flower garden and by the temporary buildings of the public libraries. Important new buildings include several hospitals in the vicinity of the Royal Infirmary, Oxford Road, the Diocesan Church House with a hall seating 2,000 persons (1911), the Y.M.C.A. (1911), the enlarged Royal Exchange (1921) and two or three churches. In 1911 Mr. Andrew Carnegie promised £15,000 to the city towards the building of three branch libraries in the Withington district, two of which were opened in 1915.

There have been many additions to the university equipment and buildings, amongst them being the new chemical (1909), botanical (1911) and physical laboratories (1912) and the Faculty of Arts building (1919). To its original faculties of arts, science, law, medicine and music were added faculties of theology (1904), commerce and administration (1904), technology (1905) and education (1914). An extension of the Manchester museum was opened on Oct. 30 1912, providing accommodation for geological, anthropological and Egyptian antiquarian collections.

The public libraries consisted in 1921 of a reference library, housed in temporary buildings, Piccadilly; a commercial, a music, and a foreign library; and 24 lending libraries, with a total of over half a million volumes. The John Rylands Library, an endowed library, containing the invaluable Althorp collection, has grown to over 250,000 volumes, and had a new wing added in 1920.

The public parks and open spaces numbered over 70 in 1921. Among recent additions are two bearing the names of their donors: the Fletcher Moss Playing Fields, Didsbury (1913–20), and the Broadhurst Park, Moston (1920).

As the seat of the Hallé and other concerts and of the Royal Manchester College of Music, Manchester takes a leading place in the musical world. The Gentlemen's Concert Society, founded nearly 200 years earlier, ceased to exist in 1920.

Though best known as the business and warehousing centre of the cotton industry, Manchester has also become a great manufacturing and distributing centre for chemicals and dyes, and some of the greatest engineering workshops in the world are in the city or its immediate neighbourhood. Motor-cars and commercial vehicles are made, and rubber manufacture and the ready-made clothing trade are extending. Manchester is also a great centre of the film trade.

The Manchester Ship Canal, on which the capital expended has been £17,084,110, was not able to pay a dividend on ordinary shares until 1915. The port was extended in 1912–3 at Trafford Park and elsewhere on the canal, and seed-crushing was undertaken at Partington.

During the World War Manchester's energies were devoted to recruiting, war charities, war loan campaigns and not unprofitable munitions work. At the general election (1918) Manchester, with 10 Parliamentary seats, for the first time in its history returned no Liberal candidate. Subsequent to the war there were six months of trade depression, followed by a boom period and a slump (1920). Several serious trade disputes occurred, one of the most interesting in its effects being the printers' strike (Aug.–Sept. 1920) during which the local newspapers appeared as typewritten bulletins. In 1921 were celebrated the centenary of the *Manchester Guardian* and the quincentenary of the Manchester cathedral. (E. A.*)

**MANCHURIA** (*see* 17.552).—By the terms of the Treaty of Portsmouth, which concluded the Russo-Japanese War (Sept. 5 1905), both the signatory Powers agreed to evacuate Manchuria and to restore China's unfettered administration throughout its three provinces, with the exception of the Liaotung peninsula, the lease of which was transferred, with China's subsequent consent, to Japan. Russia also ceded to Japan the southern section of the Manchurian railway, from Dalny to Changchun (514 m.), retaining the section from Changchun northwards to Harbin. The sovereignty of China and the "open door" were expressly recognized by this treaty.

With a view to the development of commerce and industry, which Russia and Japan had pledged themselves not to obstruct, the Chinese Government proceeded in 1908 to enlist the support of British and American capital for the construction of railways in Manchuria. After prolonged negotiations, a preliminary contract was signed, in Oct. 1909, for the construction of a trunk line from Chinchou to Aigun; but, in the meanwhile, Russia and Japan had come to a definite understanding for the protection and advancement of their respective "special interests" in northern and southern Manchuria. The American State Department's proposals for the "neutralization" of the Manchurian railways (Nov. 1909) brought Russia and Japan more closely together, and on July 4 1910 an agreement was concluded between them, which in its operation materially infringed China's sovereign rights in Manchuria and Mongolia, and violated the principle of the "open door." A joint protest against the conclusion of the Chinchou–Aigun railway agreement was addressed to the Chinese Government by the Russian and Japanese ministers at Peking, and the project, like that of the British loan agreement for a line from Hsinmintun to Fakumen, was subsequently abandoned. Later in 1910 an agreement concluded by the "Four Nations" Consortium, to finance the development of Manchuria, was blocked by Russia and Japan until their participation therein had been conceded, under conditions which secured to them continuance of their privileged position.

As early as Dec. 1905, the claims advanced by the Japanese Government, in negotiating at Peking the treaty wherein China perforce concurred in the arrangements of the Portsmouth Treaty, had given evidence of an intention not only to insist upon the reversion of all the undefined rights, privileges and concessions formerly held by Russia in South Manchuria, but also to extend the limits of Japan's "sphere of influence" in that region. By this treaty, concluded with China in Dec. 1905, Japan obtained, *inter alia*, the right to build and finance a railway from Mukden to Antung on the Korean frontier, and to undertake the construction of lines from Hsinmintun to Mukden and from Changchun to Kirin. By the beginning of 1911, the "peaceful penetration" of Manchuria and Mongolia was proceeding steadily and under conditions generally similar to those which had characterized Russia's forward policy from 1898 to 1905.

In 1912 the railway from Changchun to Kirin was opened to traffic. In May 1915, by the terms of a new treaty concluded by China as the result of the Japanese ultimatum accompanying the "21 demands," the lease of the South Manchurian railway was extended to 99 years (*i.e.* to 1997), and that of the Antung–Mukden line to A.D. 2007. By the same treaty Japanese subjects became entitled to lease land for trade, manufactures and agricultural purposes, and to reside and travel freely in South Manchuria. In 1917 the whole of the railway system of Korea was linked up with the South Manchurian railway and placed under its administration. Under these conditions the activities and influence of the railway rapidly became dominant factors in the economic life of Manchuria. Controlling numerous branch lines, owning its own coal-mines and a fleet of chartered steamers, possessing some 50,000 ac. of land adjacent to the railway line and independent powers of administration within the territory of the railway zone, its business naturally expanded with great rapidity. In 1913 the company carried 4,143,687 passengers and 5,782,161 tons of freight, as compared with 1,888,140 passengers and 2,609,036 tons of freight in 1908.

In Dec. 1915 a loan agreement was signed between the Chinese and Japanese Governments for the construction of a railway from Ssupingkai (120 m. N. of Mukden) to Liaoyuanchow in Mongolia; this line was completed in Dec. 1917. In Oct. 1917 a revision of the Changchun-Kirin loan agreement was concluded between the Chinese Government and the South Manchurian Railway Co., the result being a loan of 6½ million yen for a term of 30 years, during which period the management of the line is vested in the South Manchurian railway, on behalf of the Chinese Government. At the same time a loan of 50 million yen was issued by the Industrial Bank of Japan for four new railways in Manchuria and Mongolia.

The disorganization of the central Government in China and the collapse of Russia after 1917 served to increase the economic, financial and political ascendancy of Japan in Manchuria. As the result of a special mission sent by the Japanese Government to Washington in 1917, an exchange of Notes took place between Secretary Lansing and Viscount Ishii, in which the United States recognized that "Japan has special interests in China, particularly in that part to which her possessions are contiguous." The precise significance of the term "special interests" was undefined. As the result, however, of the negotiations initiated by the United States in July 1918, for the establishment of a four-Power consortium to coöperate in Chinese finance, and of the subsequent *pourparlers* between the British and Japanese Governments on the same subject, the latter finally agreed (May 10 1920) to withdraw the claims, previously put forward by the Japanese bankers, to exclude from the scope of the Consortium "all the rights and options held by Japan in the regions of Manchuria and Mongolia where Japan has special interests." The position adopted alike by the British, French and American Governments in regard to this question was based on the ground that Manchuria is an integral part of China, and on the desirability of eliminating all spheres of influence together with their special claims to industrial preference. The Japanese Government, in modifying its general claims and withdrawing its particular reservation of certain railways from the scope of the Consortium's operations, placed it on record that it did so because of the British Government's repeated assurance that the Consortium would not "direct any activities affecting the security of the economic life and national defence of Japan, and that the Japanese Government might firmly rely upon the good faith of the Powers concerned to refuse to countenance any operations inimical to such interests." The whole question came up for further inquiry at the Washington Conference at the close of 1921.

The economic progress achieved in Manchuria had been very rapid since 1912, and much of the expansion of its trade and industries must undoubtedly be ascribed to the enterprise shown by the Japanese in the development of mines, forestry and agriculture, and in the provision of improved transport, communications and currency.

The accompanying figures not only show the rapid increase of South Manchuria's trade, but they reflect the effects of the Russian *débacle* upon the commerce of the northern province.

There are five Chinese Customs collecting stations in Northern Manchuria, namely: Aigun, Sansing, Manchouli, Harbin and Suifenho. In South Manchuria, there are six, namely: Hunchun, Lungchingtsun, Tatungkow, Antung, Newchwang and Dairen (Dalny). The greater part of the trade of the whole country passes through the last named, which now ranks second only to Shanghai in the list of China's maritime ports; in 1908 it occupied the 42nd place. In 1918 56% of all Manchurian imports and 69% of all exports were handled at Dalny; it is also of interest to note that in 1917 Japan's share of the foreign trade of the four principal South Manchurian ports amounted to 123 millions out of a total of 157 million taels. The Chinese Customs trade report for 1919, commenting on Manchurian affairs, observes that America and Europe will probably continue to purchase Chinese goods through Japan, owing to the greater freight facilities afforded in that country and to the fact that Japanese currency is less liable to fluctuation. In 1908 the trade of Manchuria represented 11·5% of China's total; in 1918 the proportion had risen to 16·8%. The chief source of the provinces'

*Value of Manchurian Trade in Haikuan Taels.*

| | North Manchuria | South Manchuria |
|---|---|---|
| 1914 | 41,458,786 | 150,283,237 |
| 1915 | 37,275,644 | 164,437,705 |
| 1916 | 56,546,644 | 161,036,624 |
| 1917 | 41,524,836 | 209,464,759 |
| 1918 | 27,446,586 | 289,757,015 |

increasing prosperity during this period lay in the cultivation and export of the soya bean, the oil of which first found a market in Europe in 1908. In 1917 nearly half the export trade of Manchuria (70 million taels out of 153 millions) represented the value of beans, beancake and bean oil. Coal-mining under Japanese direction also gave a steadily increasing output. In 1917 the Fushun mines produced 2,275,905 tons as against 490,720 tons in 1908. The anarchical conditions prevailing in Russia and Siberia after 1917 served to increase Japan's economic and financial influence in Northern Manchuria, the ruble note being replaced in many parts of the country by the yen notes of the bank of Chosen, which in Jan. 1918 was given control of the treasury business of the Japanese Government in Manchuria. At the end of 1918 this bank had 18 branches operating in Manchuria (as against 10 in Korea), and notes in circulation to the amount of 30 million yen.

According to the statistics compiled by the South Manchurian railway, the population of Manchuria in 1916 was 20,112,100, divided as follows:—

| Province. | Area in. sq. m. | Population. | Population per sq. m. |
|---|---|---|---|
| Mukden . . . | 90,225 | 11,979,400 | 133 |
| Kirin . . . . | 81,018 | 5,638,700 | 63 |
| Amur (Heilungchiang) | 211,387 | 2,494,000 | 12 |
| Total . . . | 382,630 | 20,112,100 | 53 |

The above total includes the population of the leased territory of Kwantung and the South Manchurian railway zone, amounting to 672,000, of whom 118,364 were Japanese and 376 foreigners.

After the revolution in China the administration of each of the three provinces of Manchuria was vested in the dual control of a Tuchun (military governor) and a Shengchang (civil governor) but since 1918 the two offices have been combined in one person in the provinces of Mukden and Amur. Later, towards the beginning of 1920, the Tuchun of Mukden, Chang Tso-lin, became the most prominent figure in Chinese politics and exercised almost dictatorial authority.

See Frederick Coleman, *The Far East Unveiled* (1918); J. O. P. Bland, *China, Japan and Korea* (1921); *The Bank of Chosen, Official Report on the "Economic History of Manchuria"* (1920); *Correspondence respecting the new financial consortium in China. Blue Book, Miscellaneous No. 9* (1921). (J. O. P. B.)

**MANGIN, CHARLES MARIE EMMANUEL** (1866– ), French general, was born at Sarrebourg (Meurthe) on July 6 1866. After six months' service in the ranks (with the 77th Inf. Regt.) he entered the Ecole Speciale Militaire Oct. 30 1886 and was appointed a *sous-lieutenant* on the completion of his two years' course. The following year he went to Senegal and remained there until June 1892. In Oct. 1893 he went to the French Soudan, and spent most of the following six years either in that country or in the Congo (Marchand Mission), being made a captain in 1897. From 1901 to 1904 he was in Tonkin, and in 1905 was made lieutenant-colonel and posted to the 6th Regt. of colonial infantry. From Nov. 1906 to Dec. 1908 he served in W. Africa, returning there for six months in 1910, in which year he was promoted colonel. From Feb. 1912 to July 1913 he served both in W. Africa and Morocco and was made a general of brigade on Aug. 8 1913.

At the outbreak of the World War he was in command of the 8th Inf. Bde., but on Sept. 2 1914 took over the 5th Inf. Division. In June 1916 he was given temporary rank as a general of division and placed at the head of the XI. Army Corps. His temporary rank was made substantive in Oct. of the same year, just before he carried out at Verdun (Oct. 24 1916) the brilliant attack which resulted in the retaking of Fort Douaumont. On Dec. 19 1916 he assumed command of the VI. Army. This command formed part of the group of armies under Gen. Michelet which was designated to carry out the offensive on the Aisne in the spring of 1917. Extravagant hopes of decisive victory were cherished by his Government and the generalissimo Nivelle. Victory indeed was won, but it was a Pyrrhic victory. Mangin, involved in the bitter controversy which followed the disappointment, was made one of the scapegoats and deprived of his command. Later, however, he was exonerated from blame by a commission of inquiry and placed by M. Clemenceau at the head of the X. Army. While commanding this army he carried out, in July 1918 and in conjunction with General Degoutte, the great counter-offensive on the enemy's right flank which resulted in the first of the final series of Allied victories. He was given the Grand Cross of the Legion of Honour on July 6 1919, and was made a member of the Superior War Council in Jan. 1920. In 1921 he was sent on a special mission to South America.

The incorporation of African troops in the French army on a large scale, both before and especially during the war, was the result chiefly of Mangin's persistent advocacy of the idea, which had many opponents. His conception of a "*plus grande France*," based on political autonomy and military obligation for all parts of the French Empire, is put forward in the concluding chapters of his work *Comment finit la Guerre* (1920), which in spite of its title is really a masterly review of the whole war.

**MANITOBA** (*see* 17.584).—By the Act of the Canadian Parliament passed in the session 1911–2 the E. boundary of the province of Manitoba was extended N. to lat. 60° N. and N.E. to the point where the meridian of 89° W. intersects the S. shore of Hudson Bay. This gave the province possession of the two ports on Hudson Bay—Fort Churchill and Port Nelson—reserving certain contingent privileges to the province of Ontario in respect of access by railway. The effect of the change was to increase the area of Manitoba from 73,732 to 251,832 sq. m., of which 19,906 sq. m. are covered by water.

The province divides itself naturally into four distinct areas: (1) the prairie region, (2) the lake region, (3) the archaean axis or granitic area, and (4) the Hudsonian plateau. The prairie region lies in the extreme S.W. and comprises some 30,000 sq. m. of ancient lacustrine sediments of immense agricultural capabilities and value. The lake region forms a well-watered zone N.E. of the prairie region, containing about 40,000 sq. m., with extensive fisheries, forest, and agricultural products. The archaean axis or rugged region, of granitic and gneissoid rocks, constituting the backbone of the province, is a Laurentian plateau area of about 150,000 sq. m., where forest trees, minerals, fisheries, wild game, fur-bearing animals, and water-power abound. The maritime or Hudsonian plateau country, in the most easterly corner of the province, occupies the lower portions of the Churchill, Owl, Nelson, Hayes, and Shamattawa rivers, covering 25,000 sq. m. and containing forests, fisheries and the varied resources of a maritime region.

The general physical character of northern Manitoba is rough and broken, though it is not a mountainous region. North of Saskatchewan river and Lake Winnipeg the nature of the surface changes rapidly. The country rises and plains and swamps give way to ridges and limestone ledges. Farther north are countless lakes and streams, and the country is generally thickly wooded except for grassy meadows along the streams. The numerous waterfalls afford vast potential supplies of water-power. According to the official survey Manitoba has available water-power to the extent of 3,218,000 H.P. and is thus third in this respect among the provinces. Only 76,172 H.P. had been developed in 1921.

*Population.*—The pop. of Manitoba in 1916 was 553,860 (294,604 males and 259,256 females). The urban pop. was 241,014 and the rural 312,846. There were 117,532 families in 104,656 dwellings, with an average of 4·71 to a family. Compared with the result of previous enumerations, the tendency is for the urban pop. to increase in a greater ratio than the rural. The origins of the chief elements of the pop. were: Canadian-born 332,146, English 90,894, Scotch 63,452, Irish 50,300, French 28,573, German 15,228, Austro-Hungarian 18,001, Indian 13,894, Ukrainian 19,928. The immigrants born in the United States were 18,274; of these about 47% were of British origin. There were about 10,000 Indian half-breeds. Winnipeg, the capital city of the province, had in 1919 a pop. of

186,000. Brandon, the second city of Manitoba (pop. 15,225), has grain elevators, flour-mills, and various manufactures. It is the seat of one of the Government normal schools, and near it is the Dominion Experimental Farm. St. Boniface (pop. 11,021), opposite Winnipeg on the Red river, is the centre of the Roman Catholic interest in western Canada and the archiepiscopal seat. It is a thriving manufacturing city, and may be regarded as a suburb of Winnipeg. Selkirk, Dauphin, Waskada, Neepawa, Souris, and Minnedosa are the most important of the railway towns from which agricultural products are shipped.

*Government.*—Manitoba is administered by a lieutenant-governor appointed by the governor-general in council for a term of five years, an Executive Council of 7 members chosen from the Legislative Assembly, and a Legislative Assembly of 49 members elected by the people. The province is represented in the Dominion Parliament by 15 members in the House of Commons and 6 senators. There are 163 organized municipalities, including cities and towns. A considerable portion in the north and east is as yet without municipal organization, but school districts may be established wherever there are sufficient children.

*Education.*—The single public-school system in Manitoba is free to all religious denominations and has nearly 4,000 teachers and over 100,000 pupils enrolled. Collegiate institutes have been established in Winnipeg, Brandon, Portage la Prairie, Virden, Souris and Stonewall, and high schools and continuation classes at various smaller places. Higher education is provided by the university of Manitoba at Winnipeg, which has affiliated with it colleges of the Roman Catholic, Episcopalian, Presbyterian and Methodist denominations, also medical and pharmaceutical schools. The medical school of the university is recognized as one of the best in Canada. The Manitoba Agricultural College, near Winnipeg, is supported by the province. The number of schools and pupils enrolled has doubled within 15 years. The cost of education increased from $2,840,693 in 1907 to $6,285,878 in 1918.

*Finance.*—Revenue and expenditure were respectively $5,788,070 and $5,314,849 in 1913; $5,524,911 and $5,698,059 in 1915; $6,692,985 and $6,860,353 in 1917; and $8,986,076 and $8,544,790 in 1919.

*Agriculture.*—Ever since the opening of the country by railways Manitoba has been famous as a wheat-growing country (Manitoba wheat, from its flinty hardness and full kernel, is a specialty of the Canadian north-west; it is famed as the Manitoba "No. 1 Hard"). The enormous development in the growing of wheat is evident from the fact that in 1883 the production was 5,686,355 bus., while in 1915 it was 69,274,000 bus. The corn belt is gradually moving northward. Oats, barley and pease are also important crops. From the richness and mellowness of the soil potatoes and all tap-roots reach a great size. Vegetables of all kinds grow to perfection. Flax, rye, potatoes and turnips are also grown in quantity.

The total value of field crops in 1919 was $162,462,200, produced on an area of 6,344,318 acres. The values of farm crops were as follows in that year: fall wheat $101,000; spring wheat $78,706,000; oats $41,420,000; barley $20,137,000; rye $5,228,000; pease $170,000; mixed grains $1,063,000; flax $2,215,000; potatoes $4,266,000; turnips $663,000; hay and clover $6,818,000; fodder corn $1,520,000, and alfalfa $256,200. Wild forage plants of many kinds are abundant, hence Manitoba produces live stock as well as grain. The live-stock industry and dairy-farming are becoming more important every year. In 1918 the total dairy production amounted to over $11,000,000. Some 40 creameries were in operation producing 8,450,132 lb. of butter, an increase in one year of over a million pounds. From an importing province in respect of dairy products, Manitoba within a few years has changed to one with abundant surplus for export. Manitoba in 1919 had 227,872 milch cows and a total head of cattle of 781,771. Of sheep there were 167,170 and of swine 261,542. Hog-raising has been very profitable for the same reason that all other branches of live stock are lucrative—the stock-yards are not in control of the packing-houses, so that the Manitoba farmer has an open market. Sheep-raising is making considerable progress, a large portion of the northern part being especially adapted to that industry. Though not a fruit-growing province, Manitoba has made some progress in that respect. Small fruits grow in great abundance, and orchards of apples and plums have been successfully cultivated. Bee-keeping is also developing rapidly, the natural conditions being favourable.

*Forests.*—Northern Manitoba is forest-clad as far north as lat. 60° N. Birch, spruce, poplar, jack pine, aspen, balsam poplar, pine and tamarac are the principal trees, and supply sawmills erected at various points. The value of lumber in 1918 was $1,240,000.

*Fishing and Game.*—Large quantities of fish are obtained from Lakes Winnipeg and Manitoba, the principal catch being whitefish, with which these waters are plentifully stocked, also sturgeon, pike and pickerel. The fish are taken principally in winter, frozen on the ice and shipped to the United States or distributed to local markets. Many of the waters of the more northerly part of the province abound in whitefish, pickerel and trout. The total value of fish caught and marketed in 1919 was $1,008,000.

Prairie chickens are the principal native game birds, and once existed in great numbers throughout the prairie country. Ducks and wild geese are very plentiful on the lakes, rivers and ponds. There are numbers of elk, moose and jumping deer, and in the forests and hills the bear, wolf, lynx, fox, marten, beaver and other fur-bearing animals have their haunts.

*Mining.*—Considerable prospecting has been done in the north and east and some important discoveries have been made. There are three promising mineral belts—the Pas, Rice Lake and Star Lake areas. The Flin Flon district is rich in copper ore. The "Mandy Mine," on which work commenced in 1906, was the first to make commercial shipments; its ore (zinc blende and copper sulphide) was so rich that it paid to ship it to the smelting furnaces at Trail in British Columbia. The Flin Flon district deposits are described as extensive and rich, but requiring for development a very large amount of capital and the extension of the railway for 40 miles. The ore is a complex admixture containing copper, lead, silver and gold. To the north of Flin Flon lies a territory of great promise for gold-prospecting, and these areas might possibly justify the construction of the Hudson Bay railway for mineral traffic, even if it should fail in its original design as a grain route. Large gypsum deposits occur north-east of Lake Manitoba. The raw material is shipped to Winnipeg and converted into finished gypsum products. Soft lignites occur in the Turtle Mountain district in southern Manitoba, but have not yet been developed. Experiments were being made in 1921 for the utilization of these and other large beds by processes of carbonization and briquetting. A very beautiful mottled-gray stone, of Ordovician age, is quarried at Tyndall, east of Winnipeg. The entire interior of the new Parliament buildings at Ottawa is finished with this stone.

*Manufactures.*—Although Manitoba is essentially an agricultural province the growth of manufactures has become quite marked. Meat-packing is becoming a large industry. The burning of lime and the making of brick and tile are important. Other manufactures are wire-fencing, leather goods, clothing, cigars and biscuits. In 1918 1,444 factories, with capital $105,983,000, gave employment to 22,808 persons, who received $23,031,000 in salaries and wages and consumed $92,600,000 worth of materials in producing goods valued at $145,030,000.

*Communications.*—Three lines from the east of Canada converge at Winnipeg and radiate thence to west, north-west and south. There is connexion south with the United States and another outlet is secured by transfer from rail at Fort William and Port Arthur to the Great Lakes. The Great Northern, the Canadian Pacific and the Canadian National railways gave the province in 1920 a mileage of over 4,000 m., and each of these systems was actively extending and constructing branch lines. The Dominion Government undertook the construction of the Hudson Bay railway from the Pas on the Saskatchewan river to Port Nelson (424 m.), which is intended to give the grain-growing country an alternative short ocean route to the British market by Hudson Bay—usually safe for navigation from July 15 to Nov. 15. Its claim to consideration is that it will shorten the distance between Liverpool and the prairies by upwards of 1,000 miles. (W. L. G.*)

**MANN, TOM** (1856– ), British Labour politician, was born at Foleshill, Coventry, Warwickshire, April 15 1856. He received a very scanty education, and at the age of nine years started work on a farm. At the age of ten he was working in a coal-mine, which he left at the age of fourteen. He served seven years with an engineer tool-maker in Birmingham, went to London at the age of 21 and worked in a number of engineering firms. In 1883 he visited the United States and worked there. Returning to England, he became a Socialist in 1884 and a member of the Social Democratic Federation. He took an active part in many trade disputes, notably the London dock strike of 1889. He became president of the Dockers' Union, and first president of the International Transport Workers' Federation, and was expelled both from France and Germany in connexion with his activities as an agitator. He later became the general secretary of the I.L.P., and worked with Keir Hardie in building it up. In 1901 he went to New Zealand, and thence to Australia, where he stayed for eight years, becoming an ardent advocate of Syndicalism. In 1910 he visited South Africa, and in 1913 the United States, where he made a lecture tour from Boston to San Francisco. In 1914 he again visited South Africa to help carry on the work of the trade-union deportees, and covered the whole of South Africa in a six-month campaign of persistent propaganda. He became secretary of the Amalgamated Society of Engineers in 1919, and resigned (per rule) in 1921.

**MANOEL II.**, ex-King of Portugal (1889– ), was born at Lisbon Nov. 15 1889, the younger son of Carlos I. by his wife Marie Amélie of Orleans. On the assassination of King Carlos

and of the crown prince Luis, Duke of Braganza, Feb. 1 1908, Dom Manoel succeeded to the throne of Portugal, but he only retained it for a short time, as the revolution of Oct. 3 1910 forced him to fly the country. He took refuge with his mother in England, and finally settled at Fulwell Park, Twickenham. On Sept. 4 1913 he was married at Sigmaringen to Princess Augusta Victoria of Hohenzollern (b. Aug. 19 1890), daughter of Prince Wilhelm of Hohenzollern. Dom Manoel supported the Portuguese royalist risings of 1911 and 1912, and in the latter year met the pretender to the Portuguese throne, Dom Miguel, at Dover in order to concert a common plan of action. On the outbreak of the World War, however, he appealed to all classes of his former subjects to lay aside political feelings and unite against the common enemy.

**MAP** (*see* 17.629).—Steady progress was made in all branches of map construction until the outbreak of the World War, which had the natural effect of stopping or hindering peace-time activities amongst the principal belligerent Powers. The war had another effect, also, in that its special character on the western front resulted in the demand for a type of map not hitherto in general use in warlike operations. With regard to normal geographical and topographical maps a useful landmark was the publication in 1908 by the U.S. Geological Survey of an excellent book on the *Interpretation of Topographic Forms*. As to the historical and technical aspects of the subject there have been some interesting contributions to the history of cartography and to the study of map projections.

In connexion with the war two matters stand out as deserving of particular attention: the revival and standardization of the *International Map of the World*, and the striking progress made in the few years immediately preceding the war with the mapping of the British Empire. The recent history of the surveys of the non-belligerent countries and of most of the belligerent Powers prior to Aug. 1914 is chiefly a record of steady advance along accepted lines (*see* SURVEY). It will, therefore, be sufficient to deal here mainly with three matters: the International Map of the World, war maps, and the mapping of the British Empire.

*International Map of the World.*—The official title of this international undertaking is "Carte du Monde au Millionième," and it is under this title that references to it will generally be found. It owes its origin to the initiative of Prof. A. Penck, who put forward the project of a map of the world on a uniform scale at the Geographical Congress held at Berne in 1891. The scale proposed was one-millionth of nature, equivalent to 1 km. to 1 mm., or 15·78 m. to 1 in. The scheme and the scale were accepted by the Congress, and an international, but unofficial, committee was appointed for the purpose of prosecuting the idea. This committee reported to successive Geographical Congresses held in London in 1895, in Berlin in 1899, and in Washington in 1904, but not very much progress was made. An important step was, however, taken at the Geographical Congress held at Geneva in 1908. At this Congress the delegates of the United States made a proposal for the definite standardization of the map and for the drawing-up of fixed rules to govern its production. The next step in its history is that the Geographical Section of the British General Staff took up the subject, and a promise was given at the Geneva Congress that, if possible, an official conference should be assembled to deal with the matter. This promise was carried into effect in the following year.

In Nov. 1909 an official conference assembled at the Foreign Office in London, on the invitation of the British Government, and was opened by Sir Charles Hardinge, the Under-Secretary of State for Foreign Affairs. The countries represented were, in addition to Great Britain, Australia, Austria, Austria-Hungary, Hungary, Canada, France, Germany, Italy, Spain, Russia, the United States, *i.e.* the British Empire and the other European and American Great Powers. The Conference came to unanimous conclusions, and an account of it was published in a report issued by the British Government.

The object of having an official, rather than a non-official, or academic, conference was that experience had shown that without the support of the official map-making bodies, such as the great survey departments, little or nothing would be done in the way of actually producing the international sheets. The scale is somewhat too large for ordinary use in atlases, though it is somewhat smaller than the survey departments had been in the habit of printing.

One of the chief features of usefulness in the scale of 1 to 1,000,000 is that it enables the globe to be covered by a reasonable number of sheets, 2,084 sheets sufficing to represent the entire surface, land and water. If the next largest ordinary metric scale had been chosen (1 to 500,000), no less than 8,336 sheets would have been required. Another valuable feature is that the scale serves very well as a base scale for atlas maps, which are generally somewhat smaller. Again, it is not too small for the display of all the main natural and artificial features of a country; in fact, it is admirable for general official purposes, so much so that the provisional editions of this map were used at the Peace Conference at Paris in 1919 for the deciding of the general lines of the new international frontiers. Its uses are many and will grow as the map covers the earth. It will become the geographer's standard reference map. The sheets put together would cover the surface of a globe about 42 ft. in diameter.

At the Geographical Congress at Rome in the spring of 1913 the scheme as formulated in London was accepted generally, but there was a feeling that a more comprehensive official conference was needed in order to put the matter before those countries not hitherto represented officially. Accordingly, after some correspondence between the British and French Governments, it was agreed that the latter should issue invitations to an official conference to be held in Paris in Dec. 1913. This conference took place under the presidency of General Bourgeois; thirty-four States sent representatives and a very thorough examination was made of the London resolutions and of any proposed modifications. In the main the London resolutions were accepted, and the modifications made were not in matters of principle but of detail. The scheme had in fact got into a definite standard form, and the "Carte du Monde au Millionième" is now a world undertaking on lines accepted by practically all the countries of the world.

The authoritative version of the resolutions is to be found in a printed report by the *Service Géographique de l'Armée* (Paris 1914), entitled *Carte du Monde au Millionième, Comptes Rendus des Séances de la Deuxième Conférence Internationale, Paris, Décembre 1913*, with a supplementary volume containing illustrative plates.

The following are the principal resolutions in conformity with which the sheets of the International Map are produced:—

Each sheet of the map covers an area of four degrees in lat. by six in long., except that north of lat. 60 it shall be permissible to join two or more adjoining sheets of the same zone, so that the combined sheet covers 12, 18, etc., degrees of long. But the ordinary sheet, as stated above, will cover 24 "square degrees."

The meridian of Greenwich is the initial meridian and the limiting meridians of the sheets are at successive intervals (reckoning from Greenwich) of six degrees, and the limiting parallels (reckoning from the Equator) are at intervals of four degrees.

Each sheet is described by a letter N. or S., indicating northern or southern hemisphere; another letter for the zone in which it is, the zones being lettered from A to V extending from the Equator to 88° lat.; and a number to indicate the sector, the sectors being numbered from long. 180° E. or W. of Greenwich from 1 to 60, increasing in an easterly direction. Thus the sheet which contains Paris is N.M. 31, as shown on Plate I.

The map is plotted on a slightly modified polyconic projection, each sheet being projected independently. The lettering is to be in varieties of the Latin characters. An important resolution refers to the spelling of place names. It reads thus: "In independent or self-governing countries, in which the Latin alphabet is in habitual, or alternative, use, the spelling of the place names shall follow authorised custom. The spelling of place names in a colony, protectorate, or possession shall be that of the authorised transliteration into Latin characters in use in the governing country, provided that in the latter the Latin alphabet is in habitual, or alternative, use."

The heights are shown by contours at vertical intervals of 100 metres reckoning from mean sea-level. When these would be too crowded some may be omitted, but the 200, 500, 1,000, 1,500, 2,000, 3,000, etc., contours must always be shown. "The map shall be a hypsometric map, *i.e.* the successive altitudes shall be indicated by a system of colour tints. There may, however, be published other editions without altitude tints."

There are other technical regulations, such as those dealing with the sizes of the lettering, the boundaries, scales (a scale of km. is compulsory), sea-bed contours, all devised to ensure uniformity, and there is a diagram of conventional signs to be followed.

The regulations appear to be admirably adapted for the purpose in view, and in a few years' time it should be quite a natural thing

for a traveller or business man to ask for a sheet of the international map of the region in which he intends to travel. For students of geography or history this series, covering the world with maps on a uniform plan, will be indispensable.

In the printing of sheets of the map, perhaps the most difficult matter is to ensure that the hypsometric, or "layer," tints, which show the successive altitudes of the terrain, shall be strictly in accordance with the agreed system. To assist in this the resolutions are accompanied by a detailed diagram in colour, which serves to show the exact shade of each colour printing.

The Paris Conference, in addition to passing the very practical resolutions described above, took an important step in approving of the establishment of a "Bureau Permanent," comprising a central office to be located at the headquarters of the Ordnance Survey at Southampton, with a branch office in London. The functions of the Bureau are: the publication of an annual report on the progress of the scheme; the organization of a service of exchange of information; and the criticism, when desired, of proofs, drawings or impressions. Of these functions the first two are the most important. The branch, or auxiliary, office in London is the Royal Geographical Society, where visitors to London can obtain all information with regard to the International Map and its progress. The Director-General of the Ordnance Survey is *ex-officio* Director of the Bureau.

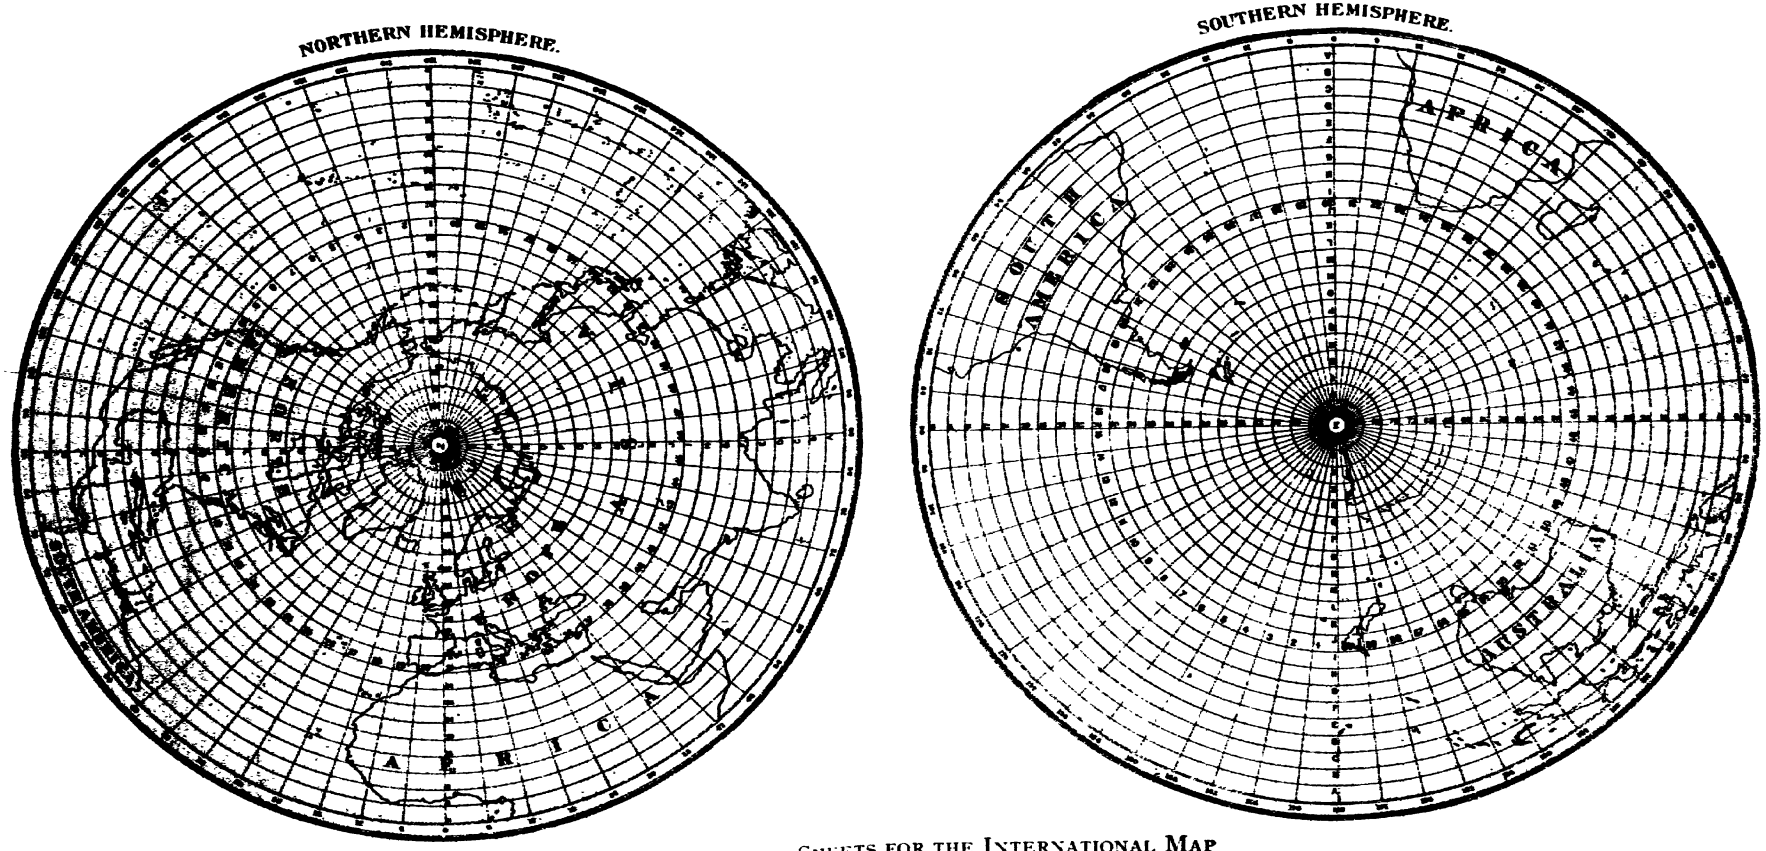
The Paris Conference came to an end on Dec. 18 1913, but the Report of this Conference was not published when war broke out early in Aug. 1914. The effect of the war on the scheme was twofold. First, it resulted in the immediate cessation of all work on the map so far as the belligerent countries were concerned; but in the second place it led to a demand for maps on, or about, the one-to-a-million scale, and so in England and France, particularly the former, much official cartography was carried out on the million scale, and a large series of maps was produced by the initiative of the General Staff. The General Staff series of maps was for the most part designed by a special staff of experts at the Royal Geographical Society, and was fair-drawn and printed by the Ordnance Survey. It adheres to the sheet lines and projection of the International Map and to a good many of the conventions, but it is not hypsometrically coloured, and from the nature of the case is somewhat roughly produced. It is, however, an important series and comprises ninety maps extending from the Persian Gulf to the Arctic Ocean, and from the western shores of Ireland to beyond the Caspian Sea. Covering as it does so important a part of the world's surface, it is of value to geography on account of its uniformity and general accuracy. A high compliment was paid to this series when its sheets were selected by the Peace Conference for use in determining the new European frontiers, and the Geographical Section of the British General Staff is to be congratulated on its foresight in arranging for its preparation. It differs from the regular international series, not only in small technical details, but also in the fact that the sheets were produced by one country and not by the countries represented; it is an essential element in the construction of the regular series that each country produces its own sheets, and where a sheet includes portions of two or more countries the sheet will be undertaken by one of them, after agreement with the others.

The International Map, so rudely interrupted by the war, has since been taken up again, and satisfactory progress has continued to be made.

At the close of 1920 maps were in hand, or had been published, by the following countries: Brazil, Canada, Chile, Denmark, Egypt, France, Great Britain, India, Italy, Japan, Portugal, Rumania, Siam, Spain, Sweden, United States, Uruguay. Thirty-six sheets had been printed and 102 were in various stages of preparation. The main continents and islands would take about 800 sheets to cover, so that a very substantial beginning amounting to about one-sixth of the full total had been made. Of course there are many parts of the world insufficiently explored for the exact information required by the regular sheets of the series, but provisional editions can be published of these sheets, and their very incompleteness will give a stimulus to exploration. The most striking group of sheets already available is that published by the Survey of India; but important blocks of sheets were, at the opening of 1921, due for early issue by the United States Geological Survey (which carries out most of the official cartography of the United States), and by Brazil and other States of South America.

*War Maps.*—The trench warfare of 1914–8 in France and Belgium created a demand for maps on a larger scale than had hitherto been in general use by great armies. Before the war, for instance, the French had been content with the black *Carte de l'état major* on the scale of 1:80,000, for the new map on the scale of 1:50,000, of which very few sheets have been printed, was evidently not taken very seriously as a military map. On the outbreak of war, in Aug. 1914, the only map of N.E. France available for the French and British armies was this 1:80,000 map, except that for certain areas round fortresses there existed the so-called "*plans directeurs*" on the scale of 1:20,000. In Belgium the cartographic situation was much better. Belgium was covered by an excellent series of maps, based on field surveys and original drawings on the scale of 1:10,000. The published Belgian maps were on the scales of 1:20,000, 1:40,000, 1:100,000 and 1:160,000. The Germans, however, also possessed these maps, so that the Allied armies had no advantage in this respect. An immediate effect of the rapid stabilizing of the position on the Franco-Belgian front was that large-scale maps became indispensable for the operations of trench warfare, particularly in connexion with the use of artillery.

With regard to that portion of the line which passed through N.E. France all that could at first be done was to enlarge the 1:80,000 to 1:20,000. Of course such an enlargement made an unreliable map, with errors of hundreds of metres, and, bit by bit, these enlargements were corrected. But the mere correction of inaccurate enlargements can never make a reliable map, and eventually all the maps of the western front were redrawn from special surveys, air photographs and revised cadastral manuscripts. The methods are described in the article SURVEY. It is sufficient to note here that the chief scales in use were those of 1:20,000 and 1:40,000; that the former scale showed the enemy's trench system in detail, and that all the maps were provided with a system of "squares," or coördinates, which enabled any point to be defined within a few metres. The use of "squares," or coordinates, is typical of modern military maps. An example of a typical trench map of the western front on the scale of 1:20,000 is shown on Plate II. The number of maps issued to the troops was very large, greatly exceeding all previous anticipations. The Ordnance Survey alone printed 32 millions of trench and other war maps during the four years and three months that the war lasted, and to this must be added the maps printed by the survey battalions in the field. Altogether the British armies in France and Belgium used some forty million maps.



*The Progress of Cartography.*—A very noticeable feature of all modern topographical maps is the increasing use of colour. The old, black, engraved maps are disappearing one by one. But however beautiful these maps were as specimens of engraving, they were never very easy to read, and in no case did they convey so much, or such accurate, information as do the modern topographical maps printed in five or six colours. However artistic a black, hachured map may be it is far less exact in the representation of hill forms than a coloured, contoured map. But it is doubtful how long the modern coloured map will last; the paper is not nearly so durable as that which is used for the printing of copper-engraved maps; and the colours are in some cases none too permanent. Perhaps in some cases in which the maps are kept in dry presses away from the light they may last for a hundred years or so; but our remote descendants can hardly be expected to see, in anything but a very decayed state, the present triumphs of cartography. These remarks apply with special force to the "layered" maps; changes in the tones of the layers will greatly alter their character.

*Topographical Maps.*—The following remarks are necessary to bring up to date the account of topographical maps given in 17.649. Such progress as has been made since 1910 was made chiefly before, or after, the war, and not during it.

*United Kingdom.*—First in order of importance, the map on the scale of one inch to one mile is now no longer published in small sheets or in black with black hachures, or in brown with brown hachures. The "popular edition" now in progress supersedes the old "fully coloured" edition. This popular edition is printed in colours with brown contours and no hachures. The contours are

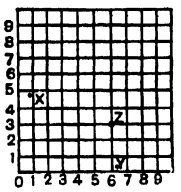
## INSTRUCTIONS AS TO THE USE OF THE SQUARES



1. The large rectangles on the map lettered A, B, C, etc., are divided into squares, 1000 yd. side, which are numbered 1, 2, 3, etc. Each of these squares is subdivided into 4 minor squares of 500 yd. side. These minor squares are considered as letters a, b, c, d (see square No. 6 in each rectangle). A point may be thus described as lying within square B.6, M.5, b, etc.

2. To locate a point within a small square, consider the sides divided into tenths and define the point by taking so many tenths from W. to E. along southern side, and so many from S. to N. along western side, the S.W. corner always being taken as the origin, and the distance along the southern side being always given by the first figure. Thus the point Z would be 63; *i.e.* 6 divisions east and 3 divisions north from origin.

3. When more accurate definition is wanted (on the 1:20,000 or 1:10,000 scale) use exactly the same method, but divide sides into 100 parts and use four figures instead of two. Thus 0847 denotes 08 parts east and 47 parts north of origin (see point X). Point Y is 6503.

4. Use 0 but not 10; use either two or four figures; do not use fractions ($8\frac{1}{2}$, $4\frac{1}{2}$, etc.).

### DIAGRAM

The system of reference by squares shown on the map and described above was used throughout the war by the British armies on the western front. Although clear and simple in practice it was not ideal for gunnery purposes. For this reason it was decided shortly before the Armistice to supersede it by another and more universally useful system (*see* article SURVEYING: *Military*).

## CONVENTIONAL COLOURS AND SIGNS

*Colours.*—The topography was represented in three colours. The detail including towns, houses, railways, roads, woods and grid lines and numbers, was printed in grey, water in blue, and contours in brown.

Military details such as trenches, battery positions, mine craters, obstacles, etc., were shown in blue (British) and red (German). British trenches were not shown *in extenso*, but only for such distance from the front line as might be assumed to be already well surveyed by the enemy.

*Conventional Signs.*—The signs used for objects of military nature changed considerably during the war as the result of alteration of types of defensive and offensive works.

now spaced at intervals of 50 ft. from sea-level to the tops of the highest mountains, instead of at intervals of 100 ft. to 1,000 ft. and then by intervals of 250 ft. This is, without doubt, a great gain. In place of the old, small-sheet, black, engraved, one-inch maps, there is now issued (following on the publication of the popular edition) an "outline edition" of the one-inch map. This map shows all detail and water in black, but has, in addition, reddish-brown contours at 50-ft. intervals. It is printed from zinc and not from copper, and its form was settled after discussion with the principal representative engineering bodies of Great Britain.

A new series of quarter-inch maps is being issued, and England and Wales are nearly covered by it. This series is completely redrawn and is printed on the layer system with coloured roads and water; 12 sheets cover England and Wales, and the series is to be continued uniformly throughout Scotland, which requires 8 sheets.

The new half-inch engraved map of Ireland is completed and is published in two forms, with brush-shaded hills, and on the layer system.

Various special tourist maps in colours have been issued, and a special series of coloured town maps on the six-inch scale is under publication.

*Canada.*—An important series of topographical maps on the scale of 1 in. to 1 m. is being published by the Department of Militia and Defence, Ottawa. These maps, which at the opening of 1921 were confined to the provinces of Ontario and Quebec, have been in progress since 1907. Each sheet covers about 25 by 17 m.; more than 70 sheets had been published by 1921, covering a total area of about 30,000 sq. m. The sheets are beautifully printed in six colours; the contours, in brown, are spaced at intervals of 50 ft.

*South Africa.*—The finest topographical maps of South Africa are those of the Orange Free State. The State was surveyed by the Colonial Survey Section, and the maps are published on the scale of 1:125,000, or about half an inch to one mile. They are printed in colours, cover the whole of the State (about 50,000 sq.m.), and are excellent maps. The northern portion of the Cape of Good Hope is covered by good reconnaissance maps, of a less accurate character, but very well printed by the Geographical Section General Staff.

*India.*—In recent years there has been a very marked improvement in the execution and printing of the topographical maps of India. Too often in former days the most painstaking and careful work in the field was spoilt and rendered half illegible by poor reproduction. Up-to-date methods of colour-printing have now been adopted with marked success, and the Survey of India maps take a good position in the cartographical world. As examples of excellent Indian work may be noted the half-inch series of the Central Provinces and Central India, and the quarter-inch of the Punjab and N.W. Frontier Province. But all over the Indian Empire there are being produced the most admirable topographical maps worthy of the reputation of that splendid department, the Survey of India.

*British Crown Colonies and Protectorates.*—Since 1900 the most marked feature of the geographical work of the British Crown Colonies and Protectorates has been the attempt to systematize the work and to accelerate the survey with the advice and encouragement of the Colonial Survey Committee and the Geographical Section General Staff. The new topographical map of *Ceylon* on the scale of 1 in. to 1 m. is an excellent production in colour, providing a great mass of useful information. The new one-inch map of the *Federated Malay States* is also deserving of high praise. In *British Tropical Africa* there is much progress to be recorded. *Uganda* and *British East Africa* are covered, so far as the more important regions are concerned, with excellent maps on the scale of 1:250,000, printed in colour by the Geographical Section General Staff. Excellent topographical surveys of *Nigeria* were being carried out at the outbreak of the war, and some sheets on the 1:125,000 scale have been printed by W. and A. K. Johnston. Admirable surveys and maps of similar series are in progress in the Gold Coast. Of course the war put a stop to all this work, but it has gradually been taken up again, especially in the West African Protectorates. The Sudan Survey Department publishes a useful series of reconnaissance sheets, on the 1:250,000 scale, of that large area. The Peninsula of Sinai, north of the Gulf of Akaba, has been topographically surveyed and a map in colours published by the Geographical Section General Staff, 23 sheets on the 1:125,000 scale and 4 on the 1:250,000 scale.

It is not too much to say that there has been more to record in the systematic mapping of the British Empire during the period 1900–20 than in any previous century.

*Other Countries.*—The admirable and well-known series of maps of the U.S. Geological Survey continues to be issued. The French 1:50,000 series in colour was, of course, completely stopped during the war, and it is believed that it is not being taken up again; only a few sheets have been issued. The Italians are mapping Tripoli and Italian Somaliland on the 1:100,000 and 1:50,000 scales. The map of Spain on the 1:100,000 scale in colours, published by the Spanish General Staff, is in progress. There is an excellent series of maps of Denmark on the 1:40,000 scale, published in colours by the Danish General Staff, and some fine maps have been issued by Norway.

AUTHORITIES.—See the official annual reports of the Ordnance Survey, the Survey of India, the Surveys of Egypt, of Ceylon, the Federated Malay States, etc. A very useful publication is the *Catalogue of Maps* published by the Geographical Section General Staff; this is, in fact, indispensable for the study of the surveys of the Empire. For the topographical surveys of the United States reference should be made to the *Annual Report of the U.S. Geological Survey;* for France, Algeria and Tunis to the Annual Report of the *Service Géographique de l'Armée.* The official reports published by the various countries provide the most reliable information on the subject. (C. F. CL.)

**MARCH, FRANCIS ANDREW** (1825–1911), American philologist (*see* 17.688), died at Easton, Pa., Sept. 9 1911.

His son, PEYTON CONWAY MARCH (1864– ), American soldier, was born at Easton, Pa., Dec. 27 1864. He graduated from Lafayette College in 1884 and four years later from the U.S. Military Academy, being commissioned second lieutenant. In 1894 he was appointed first lieutenant. He graduated from the Artillery school in 1898, and on the outbreak of the Spanish-American War went to the Philippines as captain of volunteers, in charge of the Astor battery. He remained there three years, being promoted major of volunteers in 1899 and lieutenant-colonel in 1900. After honourable discharge from volunteer service in 1901 he was appointed captain of artillery in the regular army. From 1903 to 1907 he was a member of the General Staff and in 1904 during the Russo-Japanese War was with the Japanese army in Russia as observer. He was promoted major in 1907, lieutenant-colonel in 1912, and colonel in 1916. Soon after America's entrance into the World War in 1917 he was made a brigadier-general, regular army, and later major-general of the national army, and in Sept. 1917 major-general of the regular army. In 1917 he was with General Pershing in France in charge of the American artillery forces. In March 1918 he was appointed acting chief-of-staff, and the following May chief-of-staff with the rank of general, U.S. army. The same year he was awarded the D.S.M. He also received honours from many foreign powers. In July 1920 his rank reverted to that of major-general and at his own request he was retired from active service Oct. 31 1921.

**MARCHAND, JEAN-BAPTISTE** (1863– ), French general and African explorer, was born at Thoissey (Ain) on Nov. 22 1863. After four years' service in the ranks, he was, in March 1887, appointed a sub-lieutenant. In 1889 he was on active service in Senegal, was twice wounded and made a chevalier of the Legion of Honour. He was promoted lieutenant in Jan. 1890, captain in 1892, and commandant (*chef de bataillon*) in 1898. In the latter year he carried out his historic march on and occupation of Fashoda (*see* 1.341), and for this he was promoted to the high grade of commander in the Legion of Honour, having been previously (July 1895) raised from the grade of chevalier to that of officer. In Jan. 1900 he became lieutenant-colonel, and was made colonel two years later. On the outbreak of war in Aug. 1914 he was serving on the staff of the governor of Belfort; but in Sept. he was appointed to command the Colonial Bde. of the XIV. Corps. He distinguished himself in that capacity, was cited in army orders, and in Feb. 1915 was promoted a temporary-general of brigade. The following May he assumed command of the 10th (Colonial) Division. He was wounded in Sept. 1915, and was made a grand officer of the Legion of Honour. On March 25 1916 he was made a substantive-general of brigade. In the following Oct. he was again wounded, and on March 17 1917 received a second mention for distinguished service. On April 4 1917 he was promoted general of division and confirmed in his appointment as commander of the 10th Colonial Div.—an appointment which he held throughout the later campaigns on the western front. He retired from the army in 1919 with a high reputation as a leader of troops in battle. He was given the Grand Cross of the Legion of Honour in 1920.

**MARCHESI, MATHILDE** (1826–1913), singer and teacher of singing, was born at Frankfort-on-Main March 26 1826, her father's name being Graumann. She made her début as a singer in 1844, but in 1849 began her career as a teacher, in which she speedily earned a wide reputation, teaching at the conservatoires of Vienna and Cologne, as well as in London and Paris. In 1852 she married Salvatore Marchesi, Cavaliere de Castrone (d. 1908), himself a well-known singer and teacher. Among Madame Marchesi's pupils were Emma Calvé, Emma Eames, Melba,

Emma Nevada, Gabrielle Kraus and Etelka Gerster. She published various works on the technique of singing, and in 1897 a volume of reminiscences, *Marchesi and Music*. She died in London Nov. 17 1913.

Her daughter, BLANCHE MARCHESI (b. 1863), also a famous singer and teacher, made her début as a singer very young. She first appeared in opera at Prague in 1900, and subsequently sang at Covent Garden in 1902 and 1903.

**MARCONI, GUGLIELMO** (1874– ), Italian electrical engineer and inventor of the Marconi system of wireless telegraphy, was born at Bologna April 25 1874. He was educated at Leghorn and at Bologna University, and it was in the town of his birth that he made the first wireless tests. In England his earliest wireless messages were sent between Penarth and Weston-super-Mare and on Salisbury Plain (1897). In 1899 he transmitted messages across the English Channel, and in 1902 from England to Canada and the United States. In 1904 he inaugurated the first ocean daily newspaper, the *Cunard Daily Bulletin*, on the R.M.S. "Campania." He was created hon. G.C.V.O. in 1914, was made an Italian senator, and was the recipient of many foreign decorations and honours.

**MARGUERITTE, PAUL** (1860–1918), French novelist (*see* 17.706), died at Hossegor, Landes, Dec. 30 1918. His later work, written not in collaboration with his brother Victor, included *La Maison brûle* (1913) and *Jouir* (1918).

**MARINES** (*see* 17.719).—The employment of marine forces in the World War was considerable, and, in the main, characteristic. In some instances they constituted the whole or the main part of forces told off for coastal descents, *e.g.* the British expedition to Ostend in 1914 and the Zeebrugge enterprise of 1918. In others they were called upon to undertake emergency land operations for which no other military force was available, *e.g.* in the case of the Royal Marine Bde. at Antwerp 1914; or again, as in the case of the U.S. Marine Bde. in France 1917–8, and the British 63rd (R.N.) Div., which included marine units, in the composition of a land army in continuous operations. In several instances the marines proper formed a soldier nucleus for formations of which the principal part was made up of sailors, —this was the case not only with the British R.N. Div. but also, and even more so, with the German Marine Corps. France, having long ago converted all her marines into colonial troops, used improvised battalions and brigades of sailors (*Fusiliers-Marins*) in the same way, and a brigade of these under Rear-Admi. Ronarc'h won undying glory by its defence of Dixmude during the first Ypres-Yser battle.

The German Marine Corps, as constituted in the war, had a peculiar organization. It was composed originally as a division partly of marines and partly of sailors, who—as usual in countries where recruiting is based on conscription—were numerically far in excess of naval requirements. As such it took part in the siege of Antwerp and the advance through Flanders. When stabilization came the division was raised to the strength of a corps, and the corps commander (Admi. Schröder) was made responsible not only for the Yser front but also for coast defence between Nieuport and the Dutch frontier. Further, he became responsible for purely naval operations based on the Belgian coast, having both submarines, surface craft, and aircraft under his command for the purpose. Finally, the German corps formed a third mobile division which was sent to any point on the western front where reënforcements were needed. This organization was probably unique in modern military history, and is interesting as a real attempt to weld military and naval effort at the point of junction.

*The British Royal Marines, 1914–8.*—Just before the outbreak of the World War the total strength (all ranks) of the British Corps of Royal Marines was 18,000. During the war, however, the strength of the corps increased steadily, until at the end its numbers had been more than trebled. The expansion was due to the formation of new units within the corps. Thus when in 1914 the Royal Naval Div. was formed, various divisional units of Royal Marines were raised for service with it: such as engineers (transferred to the Royal Engineers in 1917), medical units and transport. In 1915 another unit—the Royal Marine Submarine Miners—for the mining defence of unprotected ports in Great Britain and in France—was raised. The Royal Marine Labour Corps—for loading and unloading duties at French ports—and the Home Service Labour Corps were each raised in 1917. The Royal Marine Engineers—a unit 8,000 strong, for special Admiralty constructional work in England, France and Belgium—was formed in 1918. The following special units for service during the war were also provided separately, by the Royal Marine Artillery and the Royal Marine Light Infantry: a howitzer brigade R.M.A. (1915), an anti-aircraft brigade (1915, disbanded 1916) and four battalions (Chatham, Portsmouth, Plymouth and Deal) of infantry (R.M.L.I.)—raised in 1914 and absorbed into the 1st and 2nd Royal Marine Batts. in 1915 and into the 1st Royal Marine Batt. in 1918. In addition, the following special units were furnished compositely by the Royal Marine Artillery and the Royal Marine Light Infantry:—A special service battalion for Ireland (1916); the 3rd Royal Marine Batt. for service in the eastern Mediterranean —raised in 1916 and not disbanded until 1921; the 4th Royal Marine Batt. for service at Zeebrugge (1918); the 5th Royal Marine Batt.—for special anti-submarine and anti-aircraft work in connexion with submarine barrages—raised in 1918; the 6th Royal Marine Batt. for service in northern Russia (1919)—the 8th Royal Marine Batt. for service in Ireland (1920–1); 4-in. and 12-pounder batteries for service in East Africa (1916 to 1918); and four siege batteries, R.G.A. (1918–9), containing a proportion of R.M.A. or R.M.L.I.

During the war the services of the Royal Marines were shown in widely different parts of the world. In all naval actions, of course, and in naval patrol duties, the Royal Marine personnel took a part. In the early days of the war personnel of the corps were also employed with the armoured cars operating from Dunkirk. A Royal Marine Bde. was landed at Ostend in 1914 and four battalions of the brigade took part in the defence of Antwerp. Details from two R.M.L.I. battalions were involved in the landing at Kum Kalc and Sedd el Bahr (March 4 1915), and Marine Artillery siege guns were used at Dunkirk. The corps sent a battery to Egypt in 1916 for coast-defence duties. Detachments of Royal Marines served also in Cameroon, in the Persian Gulf, and with Admi. Troubridge in Serbia; and personnel of the corps formed the nucleus of the heavy batteries which were raised for service with Gen. Botha in South-West Africa and with Gen. Smuts in East Africa. The corps also furnished gun-crews for armed merchantmen, and garrisons for such defended naval bases as Scapa, Cromarty and St. Helena, and the improvised coast defences at the North Foreland, in the West Indies, and elsewhere. (E. S. H.*)

### UNITED STATES MARINE CORPS

In 1911 and again in 1912 unsettled conditions in the West Indies and Mexico made it necessary to assemble a brigade of marines at Guantanamo Bay, Cuba. On Oct. 10 of the former year the revolution which overthrew the Manchu dynasty necessitated the reënforcing of the marine legation guard at Peking and an expeditionary force of marines was dispatched to China. In Nicaragua revolutionary conditions required a large expedition to be sent to that country in 1912; there were engagements in Coyotepe, Leon, Chichigalpa and Masaya. In 1913 conditions in the West Indies required that two expeditions of marines be sent to Guantanamo Bay, Cuba, to act as a pacifying influence. In Jan. 1914 marines from the battleships landed in Haiti, in conjunction with forces of Great Britain, France and Germany. In April, marines and blue-jackets occupied Vera Cruz, Mexico, and the marines served as a part of the army in Vera Cruz and vicinity until December. An expedition of marines also served on the west coast of Mexico during these same troubles. The last half of this year found the 5th Regiment of Marines on board the U.S.S. "Hancock" in Haitian and Dominican waters to stabilize conditions in these two republics. In July 1915 marines landed in Haiti, and in May 1916 in the Dominican Republic, and served continuously in these republics.

Upon the acquisition of the Virgin Islands in 1916 a garrison of marines was established there.

When a state of war with Germany was declared to exist on April 6 1917, the corps was composed of 511 officers and 13,214 enlisted men. Of these, 187 officers and 4,546 enlisted men were on duty beyond the continental limits of the United States, and 49 officers and 2,187 enlisted men were serving on board the cruising vessels of the navy. Only five weeks later, on June 14, the 5th Regiment of Marines, consisting of approximately one-sixth of the enlisted strength of the Marine Corps, sailed from the United States, forming one-fifth of the first American troops in France. It was soon joined by the 6th Regiment and the 6th Machine-Gun Battalion, and the 4th Brigade of Marines was formed. This brigade as part of the 2nd Division fought in the Verdun sector, the battle of Belleau Wood, Soissons, Marbache sector, St. Mihiel offensive, battle of Blanc Mont Ridge, and the Meuse-Argonne offensive; and later it served in the Army of Occupation.

A total of 31,824 marines were sent overseas during the war. They were represented in 11 different divisions in the A.E.F. Approximately 2,500 marines were killed in battle and 8,600 wounded, and with deaths from other causes the casualties in France were approximately 11,500.

The Marine Corps also maintained the 5th Brigade of Marines in France; and it furnished a considerable number of officers to command army units of the 2nd and other divisions.

In 1910 the Marine Corps was composed of 334 officers and 9,521 enlisted men. On Aug. 22 1912 the enlisted strength was increased by 400, making the total 9,921. On March 3 1915 Congress authorized a reduction of 110 privates and an increase of 110 non-commissioned officers. On June 12 1916 Congress added 25 officers and 26 enlisted men. On Aug. 29 1916 Congress brought the strength up to 597 officers and 14,981 enlisted men, and established the Marine Corps Reserve, permitting the enrolment of reserves without limit as to number, and on March 26 1917, the President, under Congressional authority, further increased the corps to 693 officers and 17,400 enlisted men. On May 22 1917 Congress authorized 1,323 officers and 30,000 enlisted men. On July 1 1918 this strength was increased to 3,341 officers and 75,500 enlisted men, which is the greatest strength authorized for the Marine Corps during its history. On June 4 1920 Congress established the permanent strength at 1,254 officers and 27,400 enlisted men. Earlier, July 11 1919, Congress had reduced the Marine Corps to this strength, but of the total number 10,000 had been temporary. (E. N. McC.)

**MARKBY, SIR WILLIAM** (1829–1914), Anglo-Indian jurist (*see* 17.730*), died at Headington Hill, near Oxford, Oct. 15 1914.

**MARKETING.**—In modern business, special emphasis rests on the importance of proper arrangements for "marketing." Marketing is essentially buying and selling. The central fact is the sale. But to secure sales the goods must often be assembled from the places where they were produced, graded when qualities differ, sorted when there are different varieties, moved to market and in many cases thence to the place of consumption. Hence *assembling*, *grading*, *sorting* and *transportation* are to be considered as parts of the general marketing function. Similarly *financing*, that is, meeting the actual expenses of marketing including that of holding the products until the demand is present, constitutes a branch of market study. The risk of loss from destruction may be covered by *insurance*. Finally there may also be sales and purchases in advance of the appearance of the products on the market or even in advance of production. *Dealing in futures* and *speculation* are phases of marketing.

METHODS OF MARKETING.—There are scores of methods of marketing and hundreds of variations, but the principles involved are few and may be made clear by examples.

(*a*) *Producer Direct to Consumer.*—The simplest form of marketing and the most primitive is the sale by the producer directly to the consumer. The village boy or girl who raises flowers and sells them to passing tourists, the truck gardener near cities who disposes of his vegetables and fruits by sale direct to consumers, either from house to house or at a market-place frequented both by producers and consumers, the dairyman who peddles or delivers milk direct to consumers, are illustrations. In the aggregate, sales made in this way run into immense volume, although but a small part of the total of business. Modern business, the development of large cities, an increasing division of labour in industry, all tend to reduce this form of marketing. There are, however, variations of selling direct from producer to consumer in modern business which deserve notice. There is a considerable amount of marketing of produce, particularly butter and eggs, direct from farmers to consumers, by parcel post. Much more was hoped for from this system some years ago than has actually resulted. The development of marketing relations between small producers and small consumers is a slow process that apparently cannot be forced. Again, certain specialities, complicated machines such as printing presses, power installations, made-to-order devices, and machines requiring much attention and service after the first sale, usually are sold direct by manufacturers to consumers through the medium of speciality salesmen. The salesman is the representative of the producer in the marketing transaction. Similarly the publisher of books, maps or periodicals who sells his product through canvassers or agents is selling direct to the consumer. Again, if a retailing house does so large a business that it can advantageously engage in manufacturing some of the lines of goods it sells, it may combine production with distribution. One of the most important instances of this method of direct dealing is the mail-order house of Sears, Roebuck & Co., of Chicago, which manufactures in great quantities some of the goods—shoes for example—which it sells.

(*b*) *Through Wholesalers and Retailers.*—Most products of common use—such as foods, clothing, footwear, house furnishings, lumber, fuel and so on—are marketed through middlemen. The manufacturer of men's clothing or of shoes usually sells his product to retailers scattered over the country who in turn sell to consumers. Manufactured food products, dry goods and notions, drugs, hardware and house furnishings are generally sold first to wholesalers, who in turn sell to retailers.

(*c*) *Through Local Buyers, Wholesalers and Retailers.*—Farmers' produce, fruits, vegetables, butter and eggs are commonly marketed through local buyers, then to wholesalers or wholesale distributors, then to retailers and lastly to consumers.

(*d*) *Variations in Method.*—Variations are introduced into marketing in many ways. For example, the actual sale may be consummated through personal salesmanship either in the seller's place of business or in the buyer's. If the seller carries a line of goods he must have a store or shop, but even this may not keep him to one location. The old-time pedlar carried his store on his back. More recently grocery stores, meat shops, book and periodical shops, and even dry goods and house furnishings have been put on wheels, on automobile trucks, and sales routes laid out to be covered periodically, making sales direct to housewives and consumers. Again, the sales may be effected through retail institutions by mail. In the United States a gigantic business has been built up by a few large mail-order houses such as Sears, Roebuck & Co. and Montgomery Ward & Co., of Chicago, and the National Cloak and Suit Co. of New York, which are really stores or shops selling retail to consumers. Wholesale concerns selling only to retail dealers, such as Butler Bros., of Chicago, Charles Broadway Rouss, Inc., of New York, and the Baltimore Bargain House, have likewise developed enormous businesses founded on the mail-order method of selling. In addition to these there is an unknown but certainly large amount of business transacted by ordinary retail and wholesale stores by mail, supplementing personal selling.

Commodities of common use and of well-known standards require a minimum of demonstration and explanation. Sales in large quantities of such goods can be and are made through exchanges, organized meeting-places for those who buy and those who sell. Accordingly exchanges are located in large wholesale centres for the sale of such commodities as grain, cotton, wool, farmers' produce, sugar, coffee, iron and steel, stocks and bonds. At these exchanges, under established rules, wholesale transactions are effected with a minimum of difficulty and risk. In

** These figures indicate the volume and page number of the previous article.*

the case of highly perishable goods, such as fruits, where no time may be lost in effecting sales in order that they may reach the consumer before spoiling, the auction system is used. Wholesale buyers and salesmen come together at a designated place at a set time and clear their transactions. The auction is a much more widely used mechanism of trade in England and in continental Europe, where large quantities of nearly all kinds of goods are thus sold, than in America. The auction system has seemed, however, to be developing in recent years in America, particularly in lines of known standard or quality, which are bought in wholesale quantities only at certain brief seasons of the year, such as carpets, rugs, wool and furs.

Variation in marketing occurs through variations in ownership of the goods to be marketed. To illustrate, producers or local buyers usually sell outright to wholesalers all goods marketed through the wholesaler-retailer channel of distribution; but in highly perishable goods such as fruits, dressed poultry, live poultry, etc., and also in cases where the value of the goods runs very high in proportion to the value of the service rendered by the wholesale middleman, as for example, finished textiles, real estate, commercial paper and stocks and bonds, the wholesaler (or dealer who takes his place) frequently, if not usually, merely sells or buys as the agent of the owner and secures a commission or brokerage instead of a profit for his services. This arrangement in the case of perishable goods relieves the wholesale dealer of the risk from loss, and, in the case of costly goods, of the burden of carrying the financing of the goods. Such wholesalers are known variously as commission dealers and brokers.

While goods are being gathered together in wholesale quantities and made ready for distribution to the retail trade other factors in marketing frequently enter in, factors of a speculative nature. Well-standardized goods that are not readily perishable, such as grain, cotton, wool, silk, provisions, coffee, sugar and so on, are likely to be bought purely for speculative purposes. Thus a lot of grain or cotton may be bought and sold several times before being moved to consumption. It is but another step for these speculators to make their ventures in hope of gain on what they think future prices will be. Hence "selling futures" is a common occurrence on the great exchanges that deal in the commodities named. Under this system grain may be bought and sold long before it has been harvested or grown, or even before it is planted. A flour-miller may quite legitimately ensure his future supply of grain at a certain price by buying "futures." But a great deal of opposition has been aroused at various times by speculation in the necessities of life. It has been charged that dealing in futures enables powerful speculators to combine unjustly to secure success for their ventures, in some cases tending to hold prices down and in others tending to hold prices up. As a result both producers and consumers are suspicious of such traders. The consensus of opinion among those who have studied the course of speculation on exchanges seems, however, to be that if manipulation of prices and monopoly can be kept out of the market, and if the laws of supply and demand are allowed to operate freely, the effect of speculation, particularly of dealing in futures, has a healthful balancing effect on the market. Under such conditions purchase and sale of commodities for future delivery tend to discount and equilibrate all conditions of supply and demand, so that changes of price are made much more gradually than they would be if buying and selling of such commodities were confined solely to the stock offered each day. Dealing in futures is an essential function of marketing, but it needs careful regulation to prevent unfair practices.

Ownership of Distributing Concerns.—In the matter of ownership of the various concerns which link distribution there is most interesting variation. While the ownership of a single retail or wholesale store resting in an individual, or in a partnership composed of individuals who make this business their means of livelihood, or in a group of investors in the form of a corporation, may be considered the normal unit, gradual integration is going on both from the producers' and consumers' ends of the distribution chain.

Numerous American manufacturers have established retail store outlets of their own, such as the W. L. Douglas Shoe Co., which has now more than 100 stores of its own besides hundreds of agencies scattered through the United States; the Singer Sewing Machine Co., whose retail sales branches are found in nearly every large city; and many others in such lines as hats, baked goods, gasoline, typewriters, office furniture, phonographs, sporting goods, paper novelties, corsets, gloves, etc. One of the most notable recent American ventures into the retail field by a manufacturer is that of the Winchester Repeating Arms Co. now the Winchester Co., of New Haven, Conn. This concern adopted the policy of establishing its own retail outlets in the larger cities and of forming agency relations in other cities.

Practically all chains of stores maintained by manufacturers seem to have originated, in part at least, because the producer felt that his goods were not receiving proper attention from the regular retail stores. Ownership of the retail outlets by the producer makes it possible for the producer to sell his goods in just the way that he desires. If the store is his own, he can make sure that his goods are represented by a full line, he can dictate the price at which they shall be sold and the service that shall be given. Retailers have used coöperative methods in order to make their relations with production more direct, through buying clubs organized to accomplish specific purchases, through buying organizations of a permanent character which rival jobbing houses, through capital-ownership in wholesale houses, and in a few cases through manufacturing institutions. The rapid development of chain-store systems under single ownership and control is almost certain to accelerate the growth of this kind of cooperation of retailers in their buying activities. From the other end of the distributive chain efforts are being made to unite consumers in the ownership and control of retailing and even wholesaling establishments. Coöperative stores have had a most successful development in Europe but have not done well in America. In the United States there have been successive waves of interest in coöperation. An early example was the effort of the Workingmen's Protective Union to establish coöperative stores, beginning in 1844 and falling off at the time of the Civil War; later there were the Patrons of Husbandry and their Grange stores in the 'seventies; still later the Knights of Labor; then the California Rochdale Societies; then the Right Relationship League; and more recently the coöperative movement undertaken as a part of the policies of the Non-Partisan League, a political party with a strong following in the Dakotas and other middle-western states. All these movements, with the possible exception of the last two, seem to have exhausted themselves. The reasons for the failure of coöperation in retailing in the United States are generally said to be poor business management, unwise extension of credit, poor accounting and general slump of interest in cooperation. Coöperative stores usually claim to save customers money by reducing advertising, by cutting down service, and by locating in inexpensive places. In most instances, after a period of success, their competitors, the privately owned stores, defeat them just because they do advertise, offer the service that people want, and locate at the most convenient places.

Conditions Affecting Methods of Marketing.—The precise method of marketing and the channels of distribution to be followed for any product under present conditions depend upon a number of factors. A few of these may be enumerated.

(*a*) *Location of Producers and Size of Output.*—If producers are many and small and are located far apart, it is almost certain that their products will have to be assembled by a local buyer of some kind; whereas, if the producers are able to turn out large quantities, they may be able to deal with wholesalers direct. Producers who by ingenuity or special skill produce some article of exceptional quality are usually able to sell direct to retailers or even to consumers and thus save.

(*b*) *Location of Consumers and Demand.*—If consumers use small quantities or small lots of any product at one time, it is almost certain that they must purchase from retailers. Foods, clothing and other ordinary necessities of life fall into this classification. But a large consumer—for example, a chair factory using lumber—would not think of buying lumber from an ordinary local lumber dealer. It would be able to buy more advantageously direct from some mill.

(*c*) *Variability in Demand.*—Whether a product is wanted regularly or only occasionally is another factor in determining how it shall be marketed. Some articles cannot be sold more than once or twice in a lifetime to a customer. If it also happens that such articles require much demonstration and explanation, then the producer is almost forced to sell direct to the consumer

or have his sales made by special representatives or agents. Encyclopaedias, subscriptions to high-priced periodicals, adding machines, life insurance and real estate are illustrations of goods that need such specialized attention.

(*d*) *Degree of Perishability.*—Perishable goods need methods of marketing unlike those used for non-perishable goods. Strawberries sent through the same channels as textile piece goods or hardware, or even the channels of most groceries, would never reach the consumer in condition fit for the table. Time is a very important element in the marketing of perishable goods. There must be no delay and little time can be given to the sale of any particular unit. Another illustration of a perishable article (though in a different sense) is the daily paper, the weekly or monthly magazine. Timeliness is the essence of their value. This makes necessary a highly specialized marketing organization to carry papers or magazines over the country and, in the case of magazines, to place them on sale everywhere at the same time. Such specialized handling calls for expense not incurred in goods not perishable.

(*e*) *Unit Price and Distributing Markets.*—The price of the product to dealers and to consumers, whether high or low, constitutes another factor governing the channels to be selected in marketing. A low-priced article with a small margin of gross profit to the seller cannot be sold in the same way as an article that offers a wide margin. A 25-cent (or shilling) article, such as a handkerchief, a magazine or a screwdriver, could scarcely be sold direct. The margin above costs of production could not possibly permit the article to be advertised and sold by itself by the mail-order method. It must take its way to the consumer through the channels of trade followed by thousands of similar articles. The producer of such an article would have to sell to wholesalers, to chain stores, to department stores, or to mail-order houses doing a general business in which this particular item would be but one of a great many.

(*f*) *Competition.*—The competition in the sales field of any article might readily determine the channel of distribution that is taken. For example, a manufacturer of hardware selling direct to the retail trade found that his strongest competitor's policy was to sell to every dealer who would buy and to offer no exclusive sales arrangements, while he himself made a success by offering his goods only under exclusive sales agencies. Certain manufacturers of soaps, perfumes, and toilet goods have found it so difficult to place their products advantageously in drug stores and similar retail outlets because of the number of competing lines that they have found it advisable to sell, especially in country districts or small towns, direct to consumers by means of agents and canvassers working on a commission basis. A motor-car tire maker found it so difficult to break into the market through automobile dealers and garages that he sold his product to a mail-order house.

(*g*) *Familiarity of Consumers with Product.*—A new product must as a rule be sold through channels that may be abandoned after the public has begun to know the article. Office devices at first sold only by speciality men are gradually taken over by stationery stores. Frequently orders for new food products must first be secured by speciality men from customers before dealers will stock them and offer them for sale. Sewing machines, talking machines and musical instruments, formerly sold only by agents directly in the employ of the manufacturers, are now sold more and more through regular retail stores. As demand becomes established specialized marketing systems can give way to the more general methods.

(*h*) *Changes in Marketing Methods.*—Occasionally a product which is being sold through the regular or customary channels and is having a large sale is withdrawn and sold through a more specialized channel. Ivory Soap is a recent example; its manufacturers, after a long experience of selling to retailers through wholesalers only, during which it built up the largest single soap business in the United States, decided to eliminate the wholesaler, July 1 1920, and sell to the retailers direct. No reports on the success of the policy were available in 1921, but it is to be presumed that the sales will show some increase over the previous year unless the general conditions of business interfere. The real test in efficiency in this case will come in comparing the costs of selling per unit. Examples of other large American concerns which sell to retailers direct include the National Biscuit Co., of New York, the H. J. Heinz Co., of Pittsburgh, and the big packing companies. Many, if not most, other large food manufacturing concerns distributing through the jobbers employ their own sales organizations that do "missionary work" among the jobbers' customers.

Inefficiency in Marketing.—Many criticisms of contemporary marketing systems appeared during the decade 1910–20. The cost of living had risen steadily for nearly 20 years, and very rapidly during the period of the World War, but wages in most lines had not risen in proportion. Hence the purchasing power of the average family had, if anything, diminished. This pressure on the family means of subsistence had caused breadwinners and housekeepers, as well as students and public officials, to listen readily to complaints of the shortcomings of distribution and its probable share in high costs of commodities. Many instances have been cited of the inadequacy of the marketing system. Food-stuffs have been reported as lying on the ground decaying in agricultural districts, while city people were ready to pay high prices for them could they but get them. Those engaged in distribution have been charged not only with inefficiency but also in some instances with deliberate waste to keep up prices by reducing the supply. This accusation is mentioned here, not because it is general, but rather because it shows the temper of the people towards distribution. In the main, however, the greatest criticism levelled at distribution is that it costs too much and that these costs must be paid by the consumer. It is asserted that there is a grocery store for every 80 families and that there should not be more than one for every 200 families. In other lines of merchandise, it is urged, there is the same oversupply of dealers, needless duplication of stores, equipment, and needless sales and delivery people, all of which must be paid out of the business. Criticism has become more pointed and perhaps more constructive as information concerning distribution and its real functions has accumulated. From such studies as have been made it seems safe to state that for most goods the costs of marketing, including transportation, run higher than those of production. This fact has been accepted by the public with some surprise and a feeling that marketing should not cost so much.

Reduction of Marketing Costs.—One method of approaching the problem is to propose some new or different method of distribution. It may be urged that a more general introduction of department stores or chain stores would give more economical results. But what do the facts, so far as they are available, show?

(*a*) *Comparison of Costs by Various Methods.*—Table I contains figures compiled from actual records by the Harvard Bureau of Business Research, Harvard University.

Table I.—*Comparison of Costs of Retailing Shoes 1918.*
*Net Sales 100 %.*

| | Lowest | Highest | Usual |
|---|---|---|---|
| 1918 | | | |
| Independent shoe stores— | | | |
| Low-priced shoes | 13·3 % | 32·33 % | 20·5 % |
| High-priced shoes | 23·43 | 32·85 | 28·8 |
| Mail-order chain stores | 9·85 | 57·60 | 24·6 |
| Department stores— | | | |
| Shoe departments | 19·0 | 33·4 | 23·5 |
| 1919 | | | |
| Independent shoe stores | 13·62 | 35·63 | 24·0 |

It is clear that the statistics do not prove that in the case of shoes either chain stores or department stores can be conducted at less expense than independent stores. It is true that the lowest figure for chain stores is considerably lower than any other, but the chain stores also show the highest costs. The average costs of selling in chain stores seem to run a little higher than in independent low-priced shoe stores and in department stores. But taking the 1919 figure for the independents (a figure that includes both high- and low-priced shoes), department stores have a little the best of it.

Table II, showing cost of marketing,[1] is compiled and adapted from reports of the Harvard Bureau of Business Research, Northwestern University Bureau of Business Research, several national trades asociations, and from personal studies.

TABLE II.—*Marketing: Percentage on Sales.*

| | Wholesale | | | Retail | | |
|---|---|---|---|---|---|---|
| | Low | High | Usual | Low | High | Usual |
| Clothing | 12% | 18% | 16% | 20% | 28% | 22% |
| Drugs | 12 | 20 | 15 | 20 | 28 | 25 |
| Dry goods | 11 | 17 | 14 | 15 | 30 | 23 |
| Furniture | — | — | — | 20 | 30 | 25 |
| Groceries | 5 | 15 | 9 | 9 | 22 | 14 |
| Hardware | 13 | 21 | 18 | 11 | 32 | 18 |
| Jewellery | 15 | 20 | 18 | 24 | 32 | 26 |
| Shoes | 12 | 17 | 15 | 13 | 34 | 24 |
| General merchandise | | | | 10 | 30 | 16 |
| Department stores | | | | 18 | 30 | 28 |
| Chain stores (Shoes) | | | | 10 | 57 | 24 |
| Chain stores (5 & 10c) | | | | — | — | 25 |
| Chain stores (Groceries) | | | | — | — | 13 |
| General mail-order houses | | | | 18 | 30 | 20 |

Costs of selling through mail-order houses are not officially known. They are supposed to range from 18 to 30% of sales. But the knowledge of a general figure of this kind for a large mail-order house with many departments would be of little value even if correct. Costs of selling vary from department to department in mail-order houses just as in department stores. To be of value in a comparison of selling expenses, the figures should show the cost of selling shoes, for example, by mail. All things considered, the general costs of running a large mail-order house are probably somewhat lower than those for a large department store handling similar lines and classes of goods. The mail-order establishment need not be in a shopping district, so that the rent or investment represented by its site is comparatively small; the employees who fill orders do so more rapidly and for less pay than those who sell in a store; advertising is usually confined to the less expensive publications, and in the case of the largest houses the customers are much more numerous, running into millions. Costs in the shoe department of a mail-order house should run lower than in a department store or speciality shop, because in the mail-order house there is no time and labour lost in fitting shoes. This saving is counterbalanced somewhat by the number of shoes which are probably returned. The lower costs of selling in the mail-order house, however, are offset in part at least by the costs of transportation and other expense incidental to the customer's ordering by mail.

A part of the competitive battle for trade among these various types of institutions consists in the utilization of large buying power. The dealer who buys for the lowest price, other things being equal, can sell for the least and yet make the same profit as his competitors. Large chain-store systems, mail-order houses and large department stores frequently purchase their goods direct from producers and secure the prices usually given wholesale purchasers. In some cases a part of these differences may be used in cutting the prices to consumers, but it would be a mistake to assume that the consumer gets all the benefit from purchases made at lower prices or that this entire difference is gained for the dealers. Concerns that go direct to the producers, and thereby eliminate the wholesalers, as a rule incur practically all the usual expenses of wholesaling, such as interest on the investment in the larger stock of goods, storage risks, buying expense in dealing with numerous producers instead of a few wholesalers, extra record-keeping, and in the case of chain stores, reshipments to their various stores. The only real saving which buying direct from producers insures is the eliminated profit of the wholesaler, with a possible reduction of the expense for salesmen whom wholesalers must employ. Competition in buying has forced the joint creation by small concerns of buying organizations which, united, represent as large a buying power as the chain or department stores. Coöperation in buying certain classes of goods has strong advantages both for dealers and consumers. Buying in group at one time may secure advantages, not only in price but also in transportation and handling, sufficient to cover the added expenses incurred in buying in quantity. Thus farmers find it profitable to unite in buying a carload of fertilizers once a year. On the other hand it may be exceedingly unprofitable to buy other goods in carload lots. Large purchases would be practically out of the question on such goods as shoes, clothing and most other goods.

Comparing the various methods of retailing as exemplified in the ordinary independent stores, the department stores and the mail-order house, from such facts as are available, it does not seem possible to assert positively that any one method presents decided general economic advantages over the rest. Each presents advantages in point of service, but the differences in service appear to be fully compensated in expense, that is, the public pays for what it gets and in proportion to what it gets.

To illustrate: the modern department store gives more service in connexion with its sales than any other retailing type. It offers the purchaser the advantages of buying many kinds of merchandise under one roof. The purchaser has the benefit of elevators, rest-rooms, wash-rooms, free delivery, credit, large stocks from which to choose, liberal policies as to examination and trial, pleasant surroundings in which to shop, courteous attendants, and so on, but department store expense of distribution includes the cost of maintaining these services. The independent store probably comes second in point of service, although there is the greatest variation in this regard. Personal acquaintance and attention to customers' wants are perhaps the most important factors of independent store service. This type of store renders fewer services, and its expenses are therefore apparently somewhat lower than those of the department stores. Chain stores have had the greatest success when giving a minimum of service. No credit, no delivery and even a minimum of packing and wrapping are common policies. The policy of minimum service is in some cases carried to the extreme of having no salesmen, so-called "self-service" stores. Because the chain store gives less service it can obviously sell its goods at a lower expense. The mail-order house offers to its customers a wide range of goods to select from through a catalogue that may be studied at leisure in the home, but the mail-order house gives less personal service and requires in some ways more from the customer than any other system so far devised. The customer must decide what he wants from the study of a catalogue or other printed matter, he must make out a written order and send it, with a remittance, by mail and await the coming of the goods; he must pay transportation charges and he must make such adjustments as are rendered necessary by the fact that he did not see the goods before purchasing. With no need for showrooms, expensive locations, salespeople and some other incidental expenses, the cost of mail-order business should normally be less than that of any other type. Under the most favourable conditions it probably reaches this position. But the consumer, to some extent at least, makes up the difference by supplying the service that other retailing establishments offer him. The customer may make a money saving by trading with the mail-order house, but he does so by contributing his own time and labour to the transaction.

Another factor needs consideration in connexion with this brief study of the mail-order business. Low costs of retailing by the mail-order methods are based on successful mail-order management. But there are really very few concerns in the United States or any other country which have made a marked success of the mail-order business, while there are scores of highly successful department stores and dozens of highly successful chain-store systems. There have been numerous attempts in the mail-order field, but the failures have also been many. One of the main drawbacks of the mail-order business is the necessity to provide for the supply of merchandise, to draw up sales plans, and to publish the catalogue or other printed matter months in advance of sales. Changes in style, development of new demands and price declines or advances cannot always be foreseen. These conditions cause difficulty in the mail-order business. In a period of consistently rising prices such as obtained during the 30 years ending in the middle of 1920, mail-order methods could be safely employed on a large scale barring difficulties with styles and eccentricities of demand. But if there should be a number of years of price decline, mail-order financial managers will find their problems more difficult than they have been in the past.

So far as the public is concerned it seems safe to say that there are large classes who prefer and who will always continue to prefer to trade in those retail establishments offering them the highest developments of service, the department stores and the independent specialty shops. Other large classes prefer and will probably always prefer to buy in stores offering less service and proportionally lower prices. Undoubtedly there are many who find their greatest satisfaction in purchasing in the stores of the self-service kind where they may look about and pick up on their own initiative whatever they may wish to buy. Institutions are built to serve people in the way that they want to be served. There is room, therefore, in the retail trade for many types of stores. Specialty shops, department stores, chain stores, and mail-order houses will all continue to exist as long

[1] Costs of retailing in other lines of merchandise, so far as the figures are available, show about the same relationships. The example presented may be taken as typical.

as there are numbers of people who want the services each institution offers. It seems impossible to believe that any one type will monopolize the retail business or crowd out all the others.

Any discussion of coöperation in distribution is purposely omitted at this point, for, as has already been pointed out, coöperation does not introduce any novelty in distribution method. It merely changes the type of ownership and control from that of investor-interest to consumer- or producer-interest, depending on whether the coöperators are consumers or producers. Obviously, coöperative ownership and control can be applied to specialty shops, department stores, chain stores or mail-order houses. Any degree of service now offered or refused by any type of store can be offered or refused by coöperative institutions. Most of the savings proposed under coöperative management, other than the profit which the coöperators as owners of the business hope to secure in the form of dividends or in lower prices, come definitely from reduced service. Incidentally that has been the cause of the failure of many coöperative enterprises. Their customers withdrew because they desired more service and were willing to pay for it.

(*b*) *Individual Expenses that may be Reduced.*—There is another method of attacking the problem of the high costs of distribution, one that is not spectacular, nor revolutionary, nor necessarily drastic, but which has already given promise of results proportionate to efforts to be applied. This method is merely to apply scientific methods to the improvement of the present systems of distribution, step by step, detail by detail.

In the table already given showing costs of selling in wholesale and retail stores, it may be noted that there is a wide range between the low-cost and the high-cost stores. This range is due, in part, to differences in lines of goods handled and differences in service; but a part of the range is due to differences in operating efficiency. That some stores should be able to show a high efficiency measured in low costs over other stores gives great hope of cutting distribution costs generally, by extending to all the methods now used by the best stores. The first step in a scientific approach to reducing costs of distribution is to determine by survey, investigation and actual measurement what the present difficulties are and what stands in the way of improvement. Although considerable work has already been done in this direction, much more must be undertaken, but it is possible even at present to indicate roughly some of the details in the distribution system which may be profitably studied.

The following statements outline briefly a few of the details of distribution which it seems certain must receive attention in order to secure more economical distribution. No doubt many more could be added. Poor roads greatly increase the costs of bringing the farmers' crops and produce to market, costs that must be added to the price that consumers eventually pay. Inadequate railway transportation is another element that makes a considerable addition to the costs. Car shortages at crop-moving time; cars unsuited to the products to be hauled, excessive delays in forwarding, at terminals, on the way, and at transfer points, are common sources of expense. Every day added to the time required for transportation adds not only to the transportation charges but also directly to the cost of the goods themselves in interest charges on the capital invested in the goods, and in an additional burden of other overhead expense due to lengthening of the period of turnover. Delay in transportation as a factor of expense in distribution has not been given the attention that it deserves. Poor location of terminals makes a great deal of expensive cartage necessary. Congestion of traffic in city thoroughfares is a growing cause of increased costs in distributing goods. Inadequate, inefficient, poorly located storage facilities cause huge losses. Inadequate, unauthoritative and inaccurate collection and dissemination of market information such as is needed by producers, distributors and consumers is responsible for great wastes. Through lack of such information business in many lines now passes constantly from glut to famine and back again. Poor packing of merchandise, inefficient loading, rough handling and uneconomical methods of handling are causes of waste and therefore of higher costs of distribution.

To refer more specifically to the activities of marketing through wholesalers and retailers, there is a startling loss of the wholesale salesman's time in finding customers, in making appointments, in fruitless interviews. The time of both salesmen and buyers is lost. Probably less than a sixth of a salesman's time, averaging salesmen of all classes, is actually employed in selling or even in displaying and describing merchandise. Anything that can be done to improve this deplorable economic condition will increase efficiency and decrease costs. No one can even begin to estimate the losses resulting from poorly trained salespeople, who fail to sell and who waste the time of their purchasers through lack of knowledge of their goods, their customers' wants, and their business, or through lack of ability to use their knowledge properly. Another source of loss that adds to the high level of sales expense is that the rank and file of salespeople of most classes, but more particularly in retail stores, lack interest in their work. The fundamental incentives of profit in proportion to effort expended and of self-expression in management, such as the owners or managers feel, is for the most part totally lacking. For this reason most employees give but a fraction of their ability to their work.

Advertising is or should be an invaluable aid to marketing. In the list of expenses of distribution it occupies a prominent place. There is certainly room for improvement in its administration. Much study has been given in some organizations to such problems as the proper selection of mediums and the right use of the space taken. No doubt much greater progress can and will be made in the future in these directions, but the greatest loss in advertising seems to be in the lack of faith of the public in the advertising. If people gave more credence to advertising, much less of it would be needed to secure the same result. The remedy, of course, lies in the direction of raising the standards and shutting out the dishonest advertiser.

Duplication in delivery organizations by retail stores is a source of economic waste. A beginning has been made towards eliminating some of this waste through coöperative delivery and by utilization of the parcels post. In a few cities a good share of all retail deliveries was in 1921 being made through the post-office with a considerable saving in money and no reduction in efficiency. Poor buying, imperfect realization of public demand, duplication of stocks of goods in too many styles, brands and makes, tying up too much capital, slowing up turnover and increasing overhead expense are causes of high costs of distribution chargeable to buyers of goods both in wholesale and retail stores. There are many who think that there are too many retail stores. Would goods be sold for less if there were fewer? Probably not, because a large part of the competitive losses now occurring because of the number are borne by the dealers themselves in unpaid services. It may be argued that if their number were reduced the rentals for the locations that would be eliminated could be saved. This cannot be definitely checked by such experience as has been recorded in any public way. Concentration of retailing seems invariably to result in increasing rents. In fact, rents tend to increase faster than sales, so that the fewer the stores the higher the share of the landlord. More studies are needed to determine the exact effects of restriction of the number of stores on costs of distribution.

There is another matter that needs consideration in connexion with any attempt to reduce rents, and that is the fact that the store plant is unused for a large part of the time. It seems impossible to secure the high degree of use that may be had in a factory or shop where, when there is plenty of work to be done, the plant can be kept working both night and day by means of two or three labour shifts. Store hours are by custom and legislation steadily growing shorter. This means that the capital invested in stock and plant has fewer hours in which to produce.

Finally, there is undoubtedly an enormous loss due to unfairness and dishonesty, a loss that is now carried in large part if not wholly as an expense of distribution, being added to the price paid by the consumer. Failure to return containers lent by distributors seems a small item, but in such a business as milk distribution in large cities the loss to milk distributors due to non-return of empty bottles is enormous. Uncollectable debts and the cost of collecting delayed payments are important items in the expenses of distribution. Disregard of contracts in such matters as refusal of goods after placing orders, failure to deliver goods after orders are placed, abuse of the privilege to return goods, claims for adjustment, and many other similar items make up large losses in money, time, labour and thought that should be made available for the public good. Unfair competition, efforts made not to increase legitimate business but to impede or even to destroy competitors, commercial bribery, "graft," and the exercise of monopoly, all burden distribution expense far too much. A source of considerable loss is theft by employees, burglars and shoplifters. Some retail establishments count upon a fixed percentage on their sales representing losses due to this cause, a percentage that is added to the gross expenses which form part of the selling prices. Many of the losses of the distributive business, including theft, breakage, fire, and so on, are covered by insurance. In this way the individual distributor saves himself against exceptional loss, but the cost of the insurance is carried as an expense against the distributing process. Hence the public must pay a price for its goods that will cover these losses. Anything that can be done to reduce them will by that much reduce the expenses of distribution and the prices of goods.

Education in Marketing.—The leaks and wastes enumerated above are certainly responsible for at least a quarter of the present costs of marketing. They may be responsible for a third or even more. Here, then, is a great field for reducing costs by improving present methods. The first general step towards such improvement is education. Trained minds are the means through which the improvements may be devised and trained workers are needed to carry the improvements into effect. A beginning has been made. Before 1860 the apprenticeship system was

general in England and to some extent in America, in retail, wholesale and importing houses. Young men came to their life's work through a course of experience and training well calculated to give an all-round view of the business. The apprenticeship system gradually decreased about the middle of the 19th century, and for years after no systematic training was provided for young people other than the haphazard effect of their experience. The first training of modern salesmen in America seems to have been by the subscription book houses that flourished during the 'seventies and 'eighties. Their canvassers or book agents were thoroughly drilled or schooled in the art of selling or in securing orders. During the 'nineties sales managers in specialty manufacturing concerns, notably the National Cash Register Co., of Dayton, O., began training their men in special schools held at the factory. Training salespeople for retail stores seems to have begun in the 'nineties in such subjects as arithmetic, spelling and writing and, in 1905, in sales methods, under the auspices of the Women's Education and Industrial Union in Boston. Educational service to salespeople and other workers is now commonly found in the better classes of both wholesale and retail stores. A beginning has been made also in education in distribution and marketing in American colleges and public schools. Several colleges offer courses in marketing, selling, sales management and advertising. Many high schools give similar but somewhat more elementary courses. The main drawback to a rapid development of public education in marketing seems to be a shortage of teachers who can conduct such courses rather than lack of public interest. Considerable aid is being given to distribution through educational short courses, institutes, and conventions and extension classes conducted by some of the state universities on systems much like those adopted by the agricultural colleges in conducting educational work for farmers. Associations of dealers have given to their annual meetings more and more of the spirit of educational gatherings. Such an organization as the U.S. Chamber of Commerce in its relation to distribution is largely a clearing-house for information and educational ideas for its members. One of the notable things in the progress made in educational work for marketing is the growing conception of the relation of the sciences of psychology and sociology when practically applied to the problems of marketing. In addition to these sciences the college courses in marketing now established include economics, statistics, geography and languages, in addition to more technical business subjects such as salesmanship, advertising, sales management and accounting.

GOVERNMENT AID AND REGULATION.—The U.S. Government has taken a growing interest in marketing, particularly of agricultural products. In 1913 there was established in the U.S. Department of Agriculture a Bureau of Markets to organize and carry on studies in the marketing of agricultural products, assist in working out grades for various commodities, attack problems of transportation and storage as affecting farm products and so on. The Bureau of Markets issues monthly a document known as the *Market Reporter*. The Bureau of Crop Estimates, another division of the Department of Agriculture, publishes monthly the *Crop Reporter*, which collects and presents information on the condition of production of agricultural products. The International Agricultural Institute, located at Rome, and supported by the coöperative action of most of the Governments of the world, collects and disseminates essential crop information for all parts of the world, information invaluable to the proper distribution of food products. Since the establishment of the Federal Bureau of Markets there has been a strong tendency to establish state and local marketing bureaus to act locally and to coöperate with the national bureau. Up to Feb. 15 1921, 31 American states had started such bureaus, commissions or departments. Proposals to establish similar organizations were then before other states and were almost certain to pass. The county agents, agricultural educational officers appointed by the states to assist in the development of agriculture, working in hundreds of counties scattered all over the United States, help to organize buying and selling clubs and actually serve in many cases as sales and purchasing agents for such goods as seed grains, fertilizers and so on. In addition, the Federal Government shows its interest in marketing through control of transportation, weights and measures, storage plants and exchanges, and prevents adulteration and mishandling of products entering into interstate trade. The U.S. Department of Commerce, through its Bureau of Foreign and Domestic Commerce, collects and distributes information on export trade. The U.S. Geological Survey reports the production and distribution of minerals and metals. The Forest Service reports the production of lumber and other wood products. The Federal Trade Commission has made intensive marketing studies of certain commodities and has drawn up outlines of accounting systems suited to retailers and manufacturers. The chief function of the Commission, however, is to act as a court of investigation and trial of unfair trade.

**MARKHAM, SIR ALBERT HASTINGS** (1841–1918), British admiral and Arctic explorer, was born at Bagnères, France, Nov. 11 1841, the son of a naval captain. Entering the Royal Navy in 1856, he served during the next 16 years in the Far East (where he took a prominent part in reprisals upon the Japanese of Kagoshima for the murder of an Englishman) and on the Mediterranean and Australian stations. In 1873 he shipped as A.B. on a whaler for Davis Straits and Baffin Bay with a view to investigating that route for polar research; he took an active share in the work of the vessel, and wrote a fascinating narrative of the voyage (*A Whaling Cruise to Baffin's Bay*). In 1875 and following years he commanded H.M.S. "Alert" on the Arctic expedition under Nares, and at the head of a sledge-party he reached the highest latitude attained up to that time (83° 20′ N.). Subsequently, after further service in the Pacific and as captain of the "Vernon" torpedo school, he visited Novaya Zemlya with Sir H. Gore-Booth, and also Hudson Strait and Bay, upon which he reported to the Canadian Government as to their suitability for a commercial route. In 1886 he was appointed to command the training squadron; he was promoted rear-admiral in 1891, and in 1892 became second-in-command of the Mediterranean squadron under Sir George Tryon. His flagship was the "Camperdown" when she was rammed and sunk by the "Victoria"; he was acting under superior orders and was not censured. Subsequently he was placed in command at the Nore. He was created K.C.B. in 1903 and retired in 1906, devoting himself thereafter to literary work (including a biography of his cousin Sir Clements Markham), to the furtherance of polar exploration, and, during the World War, to the mine-sweeping service. He died in London on Oct. 28 1918.

**MARKHAM, SIR ARTHUR BASIL, 1ST BART.** (1866–1916), English politician, was born at Brimington Hall, near Chesterfield, Aug. 25 1866. He was educated at Rugby, and later entered the Sherwood Foresters. In 1900 he was elected Liberal member for the Mansfield division of Notts., where, as a wealthy colliery-owner, he exercised considerable influence. He became known as a highly independent but energetic member of the House of Commons, and was created a baronet in 1911. He died at Newstead Abbey, Mansfield, Aug. 5 1916.

His sister, VIOLET ROSA MARKHAM, born at Brimington Hall Oct. 3 1872, became well known as a traveller, making long journeys in South Africa and Siberia. In connexion with the anti-suffrage movement she made a reputation as a speaker. She was a member of the Central Committee on Women's Employment (1914), and in 1917 deputy director of the women's section of the National Service Department. The same year

she became a Companion of Honour, and in 1918 unsuccessfully contested the Mansfield division of Notts. as a Liberal. In 1919 she became a member of the Industrial Court, and in 1920 was appointed a J.P. She married in 1915 Maj. James Carruthers, A.A.G. to the British army of the Rhine. Her published works include *South Africa Past and Present* (1900); *The New Era in South Africa* (1904); *The South African Scene* (1913) and *A Woman's Watch on the Rhine* (1921).

**MARKHAM, SIR CLEMENTS ROBERT** (1830–1916), English geographer (*see* 17.734), died in London Jan. 30 1916 of shock following an accidental fire. The principal work of his later years was connected with the two Antarctic expeditions under Capt. R. F. Scott, for whom he entertained a warm personal affection, suffering a grievous blow at his loss. Markham's long-standing interest in South American geography, history and affairs led to his election as president of the International Congress of Americanists in 1912. An important history of Arctic and Antarctic exploration by Markham was completed posthumously by Dr. F. H. H. Guillemard and published in 1921 under the title of *The Lands of Silence.*

A *Life*, written by his cousin, Adml. Sir A. H. Markham, was published in 1917.

**MARLOWE, JULIA** (1870– ), American actress (*see* 17.744), first appeared in London in 1907 in Hauptmann's *The Sunken Bell*, following this by successful interpretations of Shakespearean heroines. In 1909 she played Cleopatra at the opening of the New Theatre, New York, with E. H. Sothern, afterwards touring with him in Shakespearean plays and appearing again in New York in 1910 as Lady Macbeth.

**MARNE, BATTLE OF THE.**—Under this name is included the connected series of actions fought in Sept. 1914 in the area between Paris and Verdun, when the French and British armies, which had been in full retreat from the frontier, turned at bay and inflicted defeat on the Germans, driving them to the Aisne.

To understand the claim of the battle of the Marne to be regarded as a decisive battle of the world, something more than a mere tactical narrative is necessary. The circumstances in which it was fought must be first considered. Tactically, indeed, the result was somewhat of a disappointment. No part of the German host was annihilated, or even immobilized for any length of time; the number both of trophies and prisoners was inconsiderable; the Germans broke off the fight at their own time; no great strategic pursuit such as had succeeded Jena took place; and the Germans were enabled to retire, if not unscathed, at any rate in fair order. Strategically, however, the battle was of immense import. It marked for the Allies the definite turn of the tide of defeat, while for the Germans it signified no less the collapse of the plan with which they had entered the war and on which their Great General Staff had been prepared to hazard the fate of the empire.

In spite of the victories which had marked their entry into France, the situation of the Germans by the end of Aug. 1914 was not without anxiety. The principle underlying their plan of operations had been that France was to be brought to her knees within six weeks; but when two-thirds of this period had expired the French and British armies were still keeping their opponents at arm's length. The German plan had laid down that if the French were to form a great defensive flank resting on Paris the capital was to be turned by forces pushed W. and S. of it; Ersatz divisions were to be dropped for the investment; and the five field armies pivoting on Thionville were to force the whole of the Allied forces against the Swiss frontier. An operation of such a nature, involving the handling of immense masses of men, demanded, however, a supreme direction of the highest order accompanied by most detailed instructions for the frontage of each army so that the general alignment might be preserved and overlapping prevented. These essentials were not forthcoming. Supreme Headquarters were for a time over 100 m. in rear of the German right wing, and the only means of communication were wireless telegraphy—which worked incredibly slowly—and the transmission of orders by officers in motor-cars. The inevitable result of indifferent communication was that on the German right the absence of unity of control soon showed itself to a serious extent. Further, the ever-lengthening lines of communication were adding to the supply and transport difficulties of the invaders, and slowly but surely sapping their strength. Maubeuge, too, still held out, and the retention of this fortress by the French denied to the invaders the use of a valuable line of railway. The inevitable wastage involved by a rapid advance in trying weather had made itself felt, and the cavalry horses were in serious need of rest. Nor was there any depth in the advance. From the I. Army two corps had been left in Belgium to mask Antwerp; while from the II. Army the VII. Reserve Corps was immobilized by the siege of Maubeuge. Worse still, two corps had been sent off post-haste to E. Prussia, and of these one had been subtracted from the German right wing where every man was urgently required. Nor had the right wing been drained merely to find troops for Belgium and E. Prussia. Peremptory orders had been given to send off the Ersatz divisions and 70 heavy batteries—earmarked for the investment of Paris—to take part in an attack against the Grand Couronné de Nancy.

On Aug. 28, when German Supreme Headquarters directed that Gen. von Bülow's II. Army with the I. Cavalry Corps was to advance E. of the Oise on Paris, while the I. Army of Gen. von Kluck, moving down the opposite bank of that river, was to advance towards the Seine below the capital, it was brought home to the Germans that they had not sufficient troops to carry out their grandiose plan. They "had bitten off more than they could chew"; and the net result of the extension of their line was that the II. Army, in comparative isolation, found itself committed to an advance direct against the great fortress of Paris. So perturbed was Gen. von Bülow by his situation that when the French V. Army attacked him on Aug. 29 at the battle of Guise he sent out urgent appeals by wireless messages to the I. and III. Armies to close inwards to his aid. Gen. von Bülow's cries for assistance were destined to alter the whole course of the war, for Gen. von Kluck, apparently glad of an excuse to switch off from the elusive British army, during the evening of Aug. 30 telegraphed to Supreme Headquarters to say that his army had wheeled round towards the Oise and would advance on the 31st by Compiègne and Noyon "to exploit the success of the II. Army." This involved a definite movement S. and S.E. by both these armies; but during the night an answer came by wireless from Supreme Headquarters formally approving of this new operation. In a word, an advance by the right wing against Paris was now postponed, if not definitely written off. Trusting that the newly formed French VI. Army, which had fallen back on Paris, would be chained to the capital, and convinced that the British army was incapable of any action other than licking its wounds, the German General Staff now reduced the scope of their original plan and decreed that the new objective was to be the flank of the "main French forces" in front of the II. Army. Put briefly, while envelopment by the German right wing was still the end in view it was to be an envelopment not of all but of part of the Allied forces. Success was still hoped for; but the colossal Sedan originally aimed at was ruled out of court by the growing difficulties of the strategic situation.

As for the French, the month of Aug. had been marked by a succession of failures which might well have daunted a commander of less resolution than Gen. Joffre. The offensive of their I. and II. Armies S. of Metz had failed, and failed badly; and the failure had necessitated a modification of Gen. Joffre's plan. A new offensive farther N. had begun on the 22nd, but here again failure had dogged the efforts of the French, for owing to misunderstanding and lack of coördination the whole movement collapsed, and the collapse had the effect of completely isolating the V. and British armies in the zone Mons–Charleroi. Even then the cup of failure had not been completely drained. Gen. Joffre's fresh plan, of Aug. 25, of regrouping the Allied forces and strengthening the left wing with a new French army drawn from the E., so as to take the offensive from the general line Verdun–Laon–La Fère–Bray, could not be carried out. On

Aug. 31 Amiens fell; the British were definitely cut off from their bases in the Channel ports; and the whole Allied line was withdrawn, pivoting its right on the fortress of Verdun. Paris was now in danger and the newly formed VI. Army, with Gen. Sordet's cavalry corps, was sent back to the capital, where both units were to come under the orders of Gen. Galliéni, the military governor.

Gen. Joffre, however, never wavered in his intention to assume the offensive at the first opportunity, and he decided to continue his retirement merely until the protection of a topographical obstacle would afford his troops a temporary respite during which reorganization could take place and wastage might be made good. The limits of the withdrawal were laid down as the territory immediately S. of the rivers Seine, Aube and Ornain. Tactically the barrier formed by the river lines might reasonably be expected to afford the brief breathing-time required by the Allied troops, but the project was open to the objection that its adoption would mean the abandonment of a further section of French soil and the isolation of the capital.

Meanwhile, inside Paris Gen. Galliéni was labouring with feverish energy to make good the deficiencies of defence caused by the apathy and neglect of successive French Governments. Even in the critical situation of the last days of Aug. the Government of the day was more alive to the danger of alarming the populace than to the necessity of defence, and refused to sanction some of the measures which Gen. Galliéni regarded as indispensable. The actual garrison consisted of four and a half divisions of the Territorial Army (*i.e.* men of the older classes), some cavalry and field artillery, as well as 5,000 *Fusiliers Marins* sent to reinforce the police of the capital; but on Sept. 1 the newly formed French VI. Army, some 60,000 strong under the command of Gen. Maunoury, was formally placed under the orders of the military governor. In addition to the VI. Army the cavalry corps of Gen. Sordet had been sent back to Paris, and two other reserve divs., the 61st and 62nd, were at Pontoise; but these had been very roughly handled at St. Pol and Arras and had lost most of whatever fighting efficiency they had originally possessed. A far more valuable reinforcement was the 45th Div. from N. Africa, which had just detrained in Paris and was impounded by the military governor.

At six o'clock on the evening of Sept. 1 Gen. Galliéni issued his first operation orders. In that document he laid down definitely that Paris was to form the *point d'appui* of the left of the French armies which were retreating towards the south. Gen. Maunoury, in his retirement on Paris, reinforced by the 92nd Territorial Div. and other units, was to cover the entrenched camp from the N. and E., and the cavalry corps of Gen. Sordet was placed at his disposal as a protection to his left. The 45th Div. was to be the general reserve under Gen. Galliéni's own hand, while the actual garrison of Paris itself was to consist of some four territorial divisions. The IV. Corps (from the IV. Army) had been promised by Gen. Joffre, but was not expected to arrive from Verdun until Sept. 4. In touch with the Army of Paris were the British, for the moment on the line Nanteuil-le-Haudouin–Betz, but retreating *pari passu* with the French armies on its right.

Although for more than 48 hours the Germans had renounced the advance on Paris, all through Sept. 2 it was believed in the city that they were still marching straight on the capital. The arrival of the enemy was, indeed, now thought to be but a matter of hours. German agents had notified the U.S. embassy of the forthcoming entry; the embassy had prepared notices to be affixed as safeguards to the residences of American citizens; and the ambassador called formally in person to request sanction for their issue from the military governor. Gen. Galliéni spent the afternoon in personal survey of the positions occupied by the forces under his own hand, convinced that the morrow would witness the opening of the battle which was to decide the fate of the French capital. What he had seen of the troops on whom the great duty of defending Paris was thrust had by no means reassured him. The VI. Army—largely made up of reserve troops—had not recovered from the disorganization caused by its hurried retreat from the neighbourhood of Amiens. The 45th Div. from Algiers, however, presented a more encouraging sight. Composed of seasoned soldiers, who had not been exposed to the depressing experience of retreat, and admirably equipped, its *fort bel aspect* gladdened the heart of the military governor on that anxious day; but as for the 92nd Div. of *Territoriales* its field entrenchments were but half finished, and its personnel was hardly of the class which a commander could put with confidence against first-line German troops. Gen. Galliéni's actual instructions were to defend Paris *à outrance* so as to save it from the invader; but his military instinct had led him to aim at active defence so as not only to save the capital but to make the fortress a strong support for the left flank of the Allied armies in the field. The task was a formidable one, and Gen. Galliéni was under no illusions as to the gravity of the outlook when he reached his headquarters in Paris in the evening, and heard news which altered the whole situation.

The German *glissement* towards the S.E. had begun on Aug. 31 and had actually been observed by a French cavalry patrol about noon on that date from a point near St. Maur, but curiously enough the information had never come to Gen. Galliéni's ears. Even as late as the morning of Sept. 3 all the information available had pointed to a German advance on Paris with the Senlis–Paris road as the axis of movement. But by midday the situation had completely changed. Intelligence transmitted by aeroplanes and cavalry patrols showed that the German I. Army had abandoned the march on Paris, and by evening it was clear that the main body of Gen. von Kluck's army was heading S.E. towards the junction of the right of the British with the left of the French V. Army.

Gen. Galliéni's first decision was to verify these reports so as to eliminate all possibility of error. At dawn on the following day all available aircraft ascended from the capital with express instructions to report by 10 A.M. on these movements of the German right wing. The information gathered completely confirmed the intelligence of the evening before. The Senlis–Paris road was free of Germans; Senlis and Creil were in flames; and, with the exception of some cavalry patrols, the country W. of the Senlis road was empty. So much was absolutely definite, and a comparison of the various reports sent in led to the following deduction as to the movements of the German I. Army. The IV. Reserve Corps was acting as a flank guard and was marching in two columns towards Lizy-sur-Ourcq and Meaux, flanked by some cavalry towards Crouy. The II., III., IV. and IX. Corps had crossed the Marne and were at 10 A.M. deploying along the Petit Morin from La Ferté-sous-Jouarre to Orbais.

Gen. Galliéni could now turn his attention from the actual defence of the capital to the far wider issue of the war as a whole. The situation in which he now found himself required exceptional power of judgment to ensure a right decision. On the one hand there was the German I. Army making a flank march across the N.E. of Paris, actually inviting attack, and providing a temptation almost impossible to resist; on the other hand there was the fact that Gen. Joffre had prescribed a retirement behind the Upper Seine and Aube as an essential preliminary before any offensive could be attempted. Gen. Galliéni clearly realized that combined action by the armies in the field and the army in Paris might effect immense results in the new state of affairs; but he also saw that a mere sortie by the army of Paris would be an extremely dangerous measure. He realized, in fact, that Paris and the army in the field must sink or swim together. If Gen. Joffre hoped to resume the offensive the time to do so was while his left was still in touch with the capital, which would form a *point d'appui* for that flank, and before the golden opportunity of striking at the enemy's flank had passed away.

Anticipating the sanction of the commander-in-chief, which he hoped to obtain, Gen. Galliéni at 9 A.M. ordered the commander of the VI. Army to hold his troops in readiness for an advance against the exposed flank of the German I. Army, informing him at the same time that the 45th Div. was now at his disposal. Gen. Galliéni's chief-of-staff then informed G.H.Q. by telephone that the VI. Army had now received orders to

move out eastwards in the afternoon, but that it could be directed to operate on the right or left bank of the Marne as required. The next thing was to secure the coöperation of the British, and accordingly at one o'clock Gen. Galliéni started for the headquarters of Sir John French, which were at that time fixed at Melun. The British commander was at the moment with his troops some miles in front, and in his absence it was not possible to arrive at a definite decision on a matter of such importance as the project now suggested. On his return Gen. Galliéni was shown a telegram which had come from Gen. Joffre early in the afternoon. It was to the effect that, while favouring the project of an early offensive in principle, Gen. Joffre considered that the project of carrying the VI. Army to the left bank of the Marne S. of Lagny held out the greatest prospect of success. Gen. Joffre, Gen. Galliéni and Sir John French were all equally desirous of assuming the offensive at the first available opportunity, and any divergence of opinion was but on matters of detail. Further telephonic communication removed from the mind of the commander-in-chief any lingering doubts as to the advisability of adopting Gen. Galliéni's original plan of using the VI. Army N. of the Marne. From all the information gained Gen. Joffre had now realized that a chance not often to be met with in war was offered him. He determined to assume the offensive at the earliest moment, and shortly before midnight he issued his directions in which he stated that advantage was to be taken of the situation of the German I. Army to concentrate against it the efforts of the Allied armies of the extreme left. All necessary preparations were to be carried out during the 5th, and the attack was to be made on Sept. 6. The die was now cast, and it only remained for the Franco-British armies to carry out to the full the tasks assigned them by the French generalissimo.

In detail the orders of Gen. Joffre were as follows: (*a*) All the available forces of the VI. Army N.E. of Meaux to be ready to cross the Ourcq between Lizy and May-en-Multien, in the general direction of Château-Thierry. The available portions of the I. Cavalry Corps which are close at hand to be handed over to Gen. Maunoury for this operation. (*b*) The British army to establish itself on the line Changis–Coulommiers, facing E., ready to attack in the general direction of Montmirail. (*c*) The V. Army to close slightly on its left and take up the general line Courtaçon–Esternay–Sezanne, ready to attack, generally speaking, south to north. The II. Cavalry Corps to ensure connexion between the British army and the V. Army. (*d*) The IX. Army to cover the right of the V. Army by holding the southern outlets of the St. Gond marshes and by placing part of its forces on the tableland N. of Sezanne.

In the orders issued by Gen. Joffre on the afternoon of the 4th only the VI., British, V. and IX. Armies had received detailed instructions as to the task before them, but on the 5th supplementary orders were issued, carrying on the scope of operations so as to include the French III. and IV. Armies. These orders were received by the armies concerned at about 7 P.M. on the 5th, and ran as follows:—

*IV. Army.*—To-morrow, Sept. 6, our left armies will attack the German I. and II. Armies in front and flank. The IV. Army will cease its southerly movement with that of the III. Army, which will issue N. of Revigny and take the offensive towards the north-west.

*III. Army.*—The III. Army, covering itself against attack from the N.E., will debouch to the W. to attack the left flank of enemy forces marching W. of the Argonne. It will coördinate its action with that of the IV. Army, which has received orders to attack.

Working from W. to E., the disposition of the armies of France and England between Paris and Verdun, as they stood during Sept. 5, was as follows:—

*French VI. Army:* Gen. Maunoury. VII. Corps (14th Div., 63rd Reserve Div.); IV. Corps (detraining at Cagny and vicinity; considerable delay had been caused by a railway accident *en route;* 55th and 56th Res. Divs., Gen. Lamaze; 61st and 62nd Res. Divs., Gen. Ebener; a Moroccan Brigade; I. Cavalry Corps, Gen. Sordet, less the Provisional Cavalry Div., Gen. Cornulier-Lucinière).

(This army had endeavoured to effect its concentration at Amiens, but had been forced to fall back on Paris and now stood on a line covering the capital on the N. and north-east. The 45th Div. did not actually come up until the evening of the 5th and was kept in reserve. The I. Cavalry Corps had fallen back S. of the Seine, very exhausted.)

*British Army:* Field-Marshal Sir John French. I. Corps (1st and 2nd Divs.; Gen. Sir Douglas Haig); II. Corps (3rd and 5th Divs.; Gen. Sir Horace Smith-Dorrien); III. Corps (4th Div. plus 19th Inf. Bde.; Gen. Pulteney); Cavalry Div. (5 cavalry brigades and horse artillery; Gen. Allenby).

(This army lay behind the Grand Morin on the general line Bailly–La Houssaye–Courpalay, in order, from left to right, III., II., I, and covered by the cavalry.)

*French V. Army:* Gen. Franchet d'Espérey. I., III., X., XVIII. Corps; 37th and 38th (Algerian) Divs.; 51st, 53rd and 69th Reserve Divs.; II. Cavalry Corps (Gen. Conneau).

(The front of this army extended from about Courtaçon on the left to between Esternay and Sezanne on the right.)

*French IX. Army:* Gen. Foch. IX. Corps (included Moroccan Div. *vice* 18th Div.); XI. Corps (included 18th Div.; strength 3 divs.); 42 Div.; 52nd and 60th Res. Divs.; 9th Cav. Div.

(This army occupied the front Sezanne–Camp-de-Mailly, near Sompuis. The 9th Cavalry Div. was on the right flank.)

*French IV. Army:* Gen. Langle de Cary. II. Corps; XII. Corps; XVII. Corps; Colonial Corps.

(The IV. Army occupied a position from near Sompuis through Humbauville, thence S. of Vitry-le-François, as far as Sermaise. It was reinforced on Sept. 9 by the XXI. Corps from the I. Army.)

*French III. Army:* Gen. Sarrail. IV. Corps; sent to VI. Army (IV. Corps); V. Corps; VI. Corps; one brigade of the 54th Div.; 65th, 67th and 75th Res. Divs.; 7th Cav. Div.

(This army was posted on the line Revigny–Souilly, and on its right it joined up with the mobile garrison of the fortress of Verdun. It was reinforced on Sept. 7 by the XXV. Corps from the II. Army.)

On the same date the German armies in France were thus disposed:—

*I. Army:* Gen. von Kluck. II., III., IV., IV. Res. and IX. Corps; 2nd, 4th and 9th Cav. Divs. under Gen. v. der Marwitz, with three Landwehr brigades on lines of communication.

(The III. Res. Corps of this army had been left behind to watch Antwerp, and the IX. Res. Corps, temporarily held in Germany for the defence of the N.W. coast, was only just beginning its movement to Belgium and France. The IV. Res. Corps was posted on a line S. of Nanteuil and W. of the Ourcq to form a flank guard for the new march of the German I. Army. The main body of that army had its right about Crecy, and the line ran thence generally eastwards through St. Augustine and Sancy to Esternay.)

*II. Army:* Gen. von Bülow. Guard, VII., X. and X. Res. Corps; Guard and 5th Cavalry Divs. (under Gen. von Richthofen).

(The headquarters of the II. Army were at Montmirail, and its line stretched thence, keeping N. of the marshes of St. Gond, through Congy to Ecury-le-Repos. The VII. Corps was echeloned behind the right rear, N.W. of Montmirail. The VII. Res. Corps of this army had been detached to besiege Maubeuge.)

*III. Army:* Gen. von Hausen. XII., XII. Res., and XIX. Corps, with one Landwehr brigade.

(This army consisted of Saxon troops, and was in position with its right in touch with advanced troops of the II. Army about Ecury-le-Repos. Its centre was opposite Sommesous and its left extended towards Vitry-le-François. Of the XII. Res. Corps one division—the 24th—had been left investing Givet, and did not rejoin until Sept. 7.)

*IV. Army:* Duke Albrecht of Württemberg. VIII., VIII. Res., XVIII., and XVIII. Res. Corps, with one Landwehr brigade.

(The line of this army ran from near Vitry-le-François to Ponthion and thence by Possesse to Somme-Yèvre.)

*V. Army:* German Crown Prince. V., V. Res., VI., VI. Res., XIII. and XVI. Corps; 33rd Res. Div., 2nd Landwehr Div. with additional brigades, five in all; 3rd and 6th Cavalry Divs.

(The Crown Prince's army lay in two portions. One part of it—the VI., XIII. and XVI. active corps—faced the French III. Army on the line Charmontoise–Triaucourt–Froidos. The two reserve corps were to the N. of Verdun, the VI. Res. being on the left-hand bank near Montfaucon and the V. Res. on the opposite bank about Consenvoye. The active corps was E. of Verdun, and the 33rd Res. Div. and the Landwehr formed a special force in Woevre and on the Moselle based on Metz.)

The French, British and German armies thus enumerated were those immediately concerned in the operations which are now known as the battle of the Marne. Farther to the S.E., between the fortress of Toul and the Swiss frontier, the German VI. (Rupprecht, Crown Prince of Bavaria) and VII. (Gen. von Heeringen) Armies had been heavily engaged with the French I. and II. Armies since the middle of August.

The area on which the battle was about to be contested forms roughly a rectangle from E. to W. of 150 M., and as the distance from the southern to the northern edge is 50 M. the battlefield may be said to cover some 6,000 sq. M. of area. Save for the

fortress of Verdun the actual battlefield contained no feature, the capture or retention of which would have vitally affected the battle, but it was of a very diversified nature. The western strip is, generally speaking, a large cultivated plain, in which the Marne, flowing through a well-marked valley, receives as tributaries the Ourcq and the two Morins. Like the parent river, the tributaries are slow-moving and unfordable, but well provided with stone bridges and lined with woods and country houses. This sector of the battlefield is fairly open; but an exception must be made of the forests of Villers-Cotterets and Compiègne, where the paths are intricate and blind, and where a force losing direction might find itself in serious difficulties if attacked. East of this sector is a strip bounded generally by N. and S. lines through Soissons and Reims, and roughly bisected by the course of the river Marne. Generally speaking, the terrain here is a plateau cut by the well-marked river valley and marked by copses and plantations which increase in size and frequency towards the east. The eastern edge of the plateau, running from the Montagne de Reims to the Aisne, and thence to Laon and beyond, forms the line of heights known as Les Falaises de Champagne. A tactical feature of some importance is the marshland near Sezanne called Les Marais de Saint Gond, formed by a pocket of clay and extending for about 10–12 m. from E. to W., and 1–2 m. broad. The marshes have been to a large extent reclaimed, and between the acres of grassland the streams which unite to form the Petit Morin run in deep ditches. In fine weather the ground is fairly dry, but in heavy rains the slopes N. and S. drain down to the pocket, the canalized streams overflow, and the clay soil becomes one vast quagmire. Some narrow causeways have been constructed, but these can be brought under artillery fire, particularly from a round-topped hill at Mondement, which is a valuable tactical feature; and since the causeways are neither engineered nor metalled they are all likely in flood time to become as deep in mud as the adjoining marshes. Passing eastward, the third strip of the battlefield is the wide plain of Champagne Pouilleuse. Here are long undulating ridges covered with heath and crowned on top with small fir plantations, moorlands with patches of cultivation, and two large permanent training camps N. and S. of Châlons, the whole forming a fine arena for a conventional battle of the three arms.

East of this immense plain the woods become more frequent and dense, meriting in many cases the larger designation of forests. Chief among these is the Forest of Argonne, a long, densely wooded low ridge running almost N. and S., traversed only by a few paths and by two gaps, through which run two high roads and the St. Menehould–Verdun railway. Between the ridge and the valley of the Meuse lies an upland country, chiefly of pasture-land intersected by numerous narrow ravines; and on the right bank of the Meuse are the abrupt Hauts-de-Meuse (or Côtes de la Meuse), looking down on the plain of the Woevre.

In this sector of the battlefield is situated the fortress of Verdun, which, although it formed a very sharp salient in the French line, yet by its projection served the useful purpose of dividing the Crown Prince's army into two parts. Unlike Namur and Liége, the fortress had been kept in readiness to resist a sudden attack and contained an adequate garrison, including mobile troops distinct from the field armies. Further, the forts of the perimeter had been supplemented by a network of trenches and outworks pushed well out, which greatly minimized the chance of the fortress being quickly crushed by a concentrated storm of heavy artillery fire. In spite of the great use which the Germans made of mechanical transport, the retention of Verdun in French hands was a serious handicap to the invaders, for it prevented their making use of the main line of railway running thence to Germany; and the difficulty of communication was aggravated by the fact that when the battle began Maubeuge was still untaken and the main line of railway from Cologne through Liége and Namur was in consequence blocked. Practically the only line of rail available to supply the 1¼ to 1½ million Germans deployed along the general line of the Marne was that which [illegible] from Reims to Mezières and thence by the valley of the Meuse to Dinant and Namur. In lateral communications, however, the Germans were admirably served, the Meaux–Reims–Verdun and Meaux–Châlons–Verdun railways affording them the means of transferring troops from one portion of the battlefield to another at will. The suddenness and impetuosity of the Allies' attack, however, was to render the advantage a theoretical rather than an actual benefit.

The new "limited envelopment" scheme of the German General Staff held the field for just four days; and, to carry it out, Supreme Headquarters sent out orders on Sept. 3 to the effect that the I. Army was to follow in echelon behind the II. and to be responsible for the protection of the right flank of the whole German front. But at the moment when the orders were issued the situation was far different from that envisaged by Supreme Headquarters. So far from being echeloned behind the II. Army, Gen. von Kluck's columns were hurrying over the Marne, with the II. Army more than a day's march behind upon the Aisne. It has been suggested that Gen. von Kluck was fired by the recollection of Prince Frederick Charles at Mars-la-Tour, in which battle the former had served as a young officer of artillery. Be this as it may, in spite of the orders issued he continued his advance, and Supreme Headquarters quickly came to the conclusion that even the limited envelopment, which had been substituted for the original plan, must be curtailed.

It was during the evening of Sept. 4 that the new directive was brought to the I. Army. The essential point in it was the announcement that the attempt to force the whole French army back in a south-easterly direction, towards the Swiss frontier, was no longer practicable. Intelligence had reached the Germans about movements of French troops westward from Toul and Belfort, which pointed to a concentration on the French left; and further, there was an ominous reference to a collection of troops in the neighbourhood of Paris to threaten the right flank of the German I. Army. How far the initiative had passed from the Germans is revealed by a study of these orders of the evening of Sept. 4. The whole German plan broke down, and the invaders had to reshape their scheme to cope with that of Gen. Joffre. The I. and II. Armies were now to face E. towards Paris, the former between the Oise and the Marne and the latter between the Marne and the Seine; on the left the IV. and V. Armies by a determined advance S.E. were to open a passage across the Moselle for the VI. and VII. Armies, in which region a *pianissimo* Sedan might still take place, although Supreme Headquarters cautiously stated that "success could not yet be foreseen." The III. Army in the centre was to push S. ready to help either wing as required. Thus Gen. von Moltke was forced to throw to the winds the hopes founded on the great massive wheel of five armies pivoting on Thionville, and, instead, was compelled hurriedly to assign to his armies three divergent axes of march towards the W., S., and S.E.

Gen. von Kluck's contribution towards solving the difficult problem with which Supreme Headquarters were confronted was to disregard his orders. Instead of remaining between the Oise and the Marne he continued to push on over the latter river, increasing at every step his lead over the II. Army, behind which he should have been following. As the French VI. Army had orders to be in a position of readiness N.E. of Paris so as to be able to cross the Ourcq between Lizy and May-en-Multien in the general direction of Château-Thierry, early collision between it and the flank guard of the German I. Army was now but a matter of hours. Gen. Joffre had ordered that the offensive was to be begun by the VI., British, and V. Armies on the morning of Sept. 6, but as a matter of fact the battle was brought on earlier by the preliminary movements of the VI. Army.

In view of the forthcoming offensive the French VI. Army, during Sept. 5, began to fill in to its right so as to deploy generally on the line St. Mesmes–Foret d'Ermonville facing north-east. Opposite the right wing of this position and commanding all the neighbouring terrain runs a well-marked ridge which, starting from the high ground of Dammartin, is prolonged towards the S.E. by the hill at Montgé, and thence by a succession of isolated knolls, of which the more pronounced are those of Monthyon

and Penchard. The attempt by the divisions of Gen. Lamaze, which formed the right wing of the VI. Army, to secure this commanding ground brought on the battle of the Marne.

Almost exactly at noon, when a battalion of the 55th Div. was settling down to its midday meal near the hamlet of Villeroy, it was surprised by a storm of shells from some German batteries beyond Monthyon and Penchard. Some very fierce fighting ensued, and the French line gradually forced its way past Plessis and Iverny towards the Montgé–Penchard ridge, while slightly to the S. Neufmontiers fell into the hands of the Moroccan Brigade. The French, however, were not able to hold their gains against the resistance of the German IV. Reserve Corps and during the evening their line in this position of the field was withdrawn to Le Plessis–Iverny–Villeroy–Charny, while to the N. St. Soupplets was held by the 56th Div. The left wing formed by the VII. Corps meanwhile had taken up the line Dammartin–Plailly without incident. Thus the VI. Army after severe fighting in which heavy losses were incurred, had secured but little advantage of ground, although, on the other hand, the possession of St. Soupplets on the Senlis–Marne road was of distinct value.

During the day Gen. von Kluck had drawn up a set of orders in compliance with the instructions he had received from Supreme Headquarters relative to his taking up a position between the Oise and the Marne. This would imply a retrograde movement of the I. Army; but Gen. von Kluck was at the time labouring under the delusion that there was as yet no great danger threatening his right flank, and that a march back to cover it could be carried out without interruption. Consequently his orders fixed no definite time at which the withdrawal across the Marne was to begin, and until late in the night of Sept. 5–6 he seems to have believed that he could still emulate the Red Prince of 1870. The reports which kept coming in, however, eventually undeceived him, and an urgent order was sent to the II. Corps to begin its retrograde movement early on the 6th so as to be in a position to support the IV. Reserve Corps if required, a movement which was to react upon the offensive of the French army.

That army moved out to the attack with both flanks covered by cavalry, on the right being a division under Gen. Cornulier-Lucinière, while Gen. Sordet's cavalry corps was coming up on the left. The bulk of the day's fighting took place opposite the right wing, especially on the extreme right. The 56th Div., leaving St. Soupplets at daybreak, fought its way without much difficulty to Marcilly, but farther S. the 55th Div. experienced far greater difficulties. Barcy was taken and retaken three times, but had finally to be abandoned, and Chambry was occupied by a portion of the 54th Div. only after several attacks by the 55th had been beaten back. It was now clear that the German IV. Reserve Corps was being reinforced, and the same impression was received on the VI. Army's left. No sooner had the VII. Corps come into action than two enemy columns were signalled as moving upon Vareddes and Lizy, and these were in fact the 3rd and 4th Divs. of the German II. Corps. Thus by the middle of the afternoon, while the divisions of Gen. Lamaze were facing the high ground about Etrepilly and the VII. Corps in the left wing had reached the line Villers St. Genest–Bregy, the German resistance had considerably hardened.

Gen. von Kluck could, however, only reinforce his right flank at the expense of his front, and, in consequence, opposite the British there was a noticeable slackening in the advance of the German I. Army. Put briefly, the relative situation of that army had changed. What had been its right flank—consisting of the IV. Reserve Corps and a cavalry division—was, by successive reinforcements, to become the front; while the original front, by a corresponding diminution, was transformed into the left flank, and the army as a whole was to face W. instead of S. The orders conveying to the British troops the news that their long retreat was definitely ended were issued during the afternoon of the 5th, although many of the battalions did not know when they left their billets on the morning of the 6th whether or not they were to march southwards to the Atlantic. As soon as the rank and file discovered that their route led northwards, roars of cheering burst forth with such enthusiasm as to leave a lasting impression on those who shared in that memorable day. The hesitation observable in the German advance was soon followed by an unmistakable retrograde movement. The British lost no time in seizing the heights on the Grand Morin S. of Coulommiers, from which German heavy guns had during the morning brought an effective fire to bear, and by evening the British advance guard had reached Villiers-sur-Morin and Crecy (III. Corps), Coulommiers (II. Corps) and Choisy (I. Corps). Save for some fighting early in the morning about Rozoy—an action brought on by the Germans to cover their retreat—the British were not heavily engaged, though a few prisoners and machine-guns were taken.

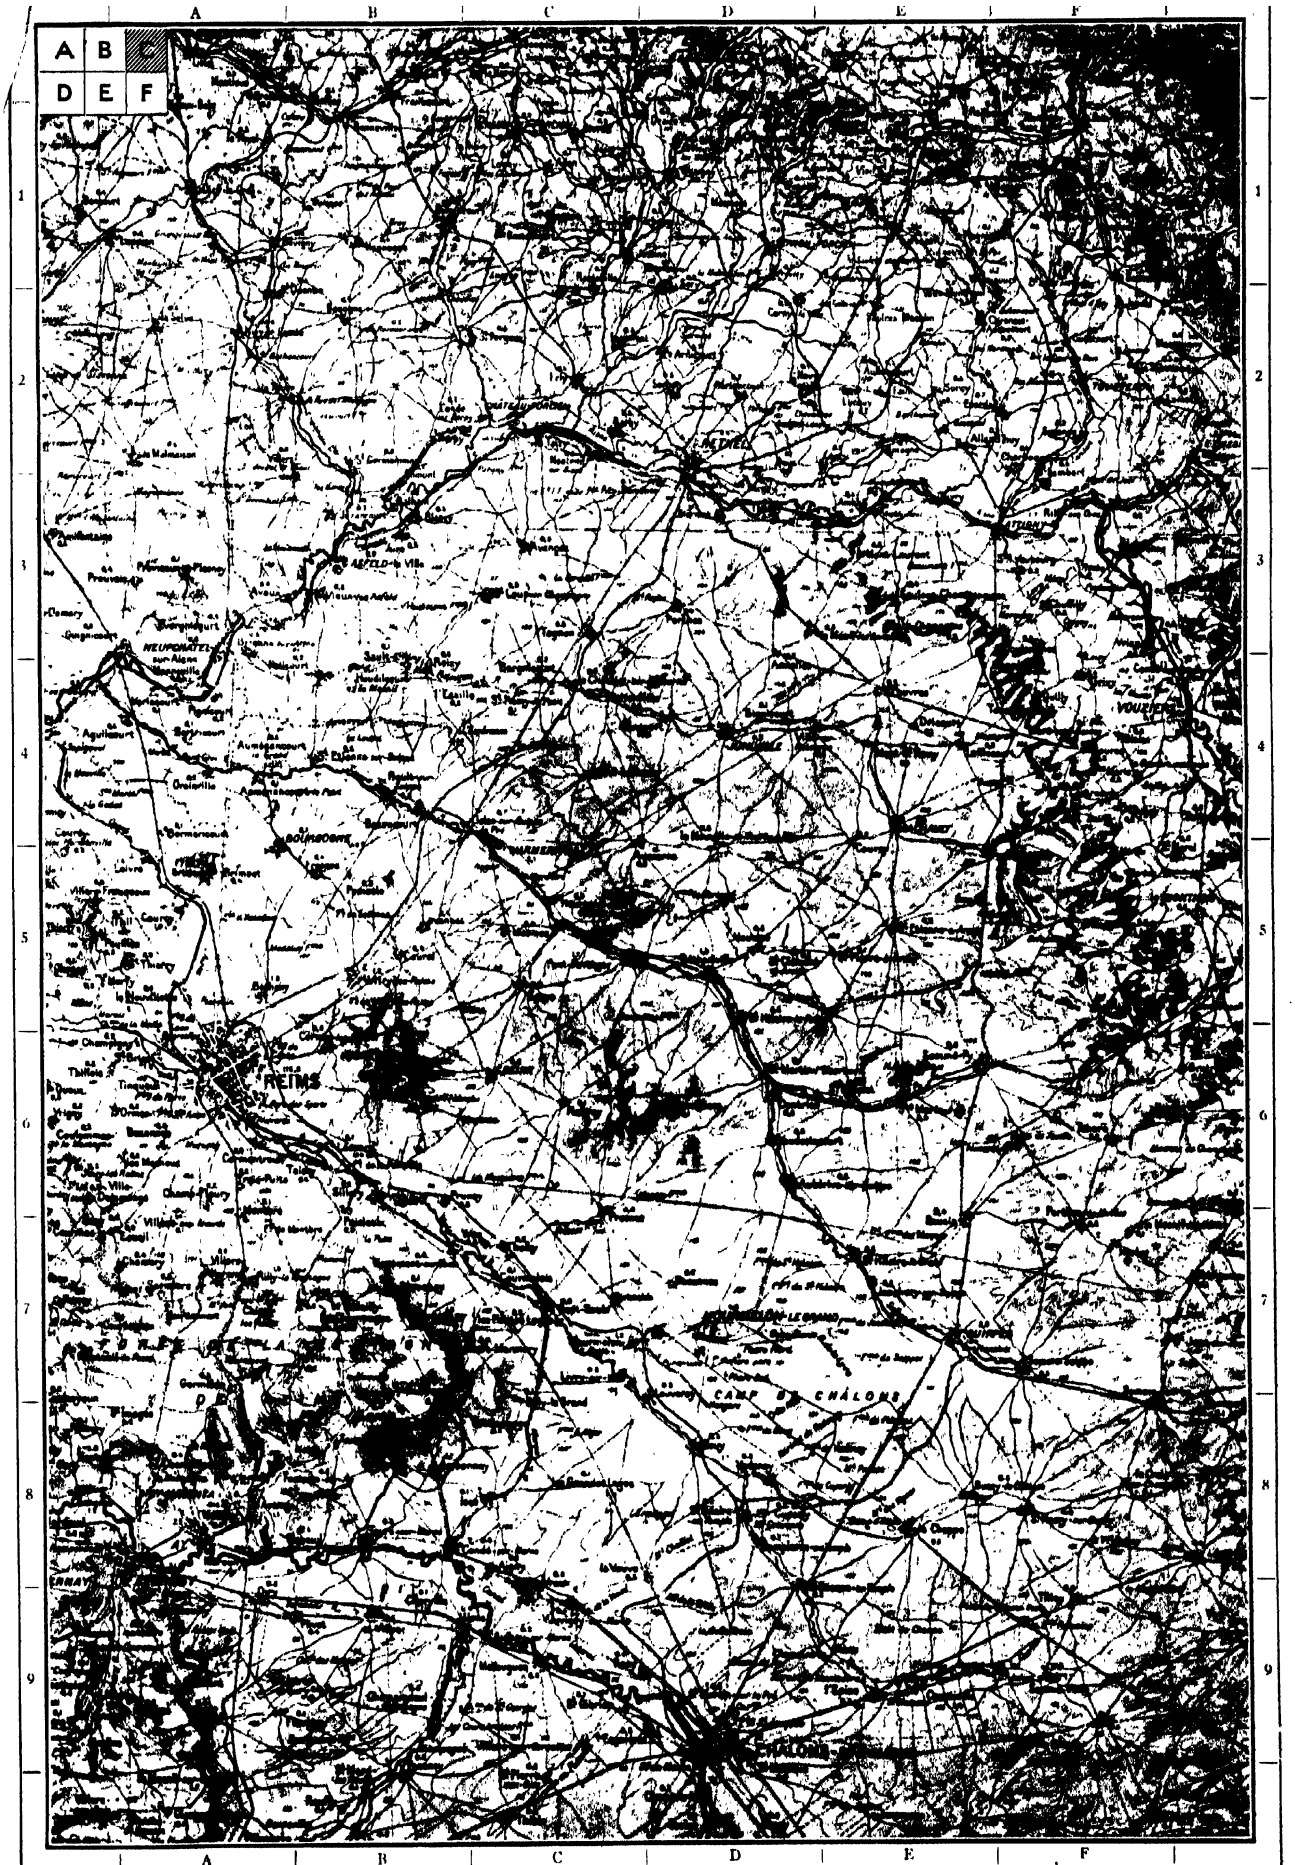
In the orders issued by Gen. Joffre on Sept. 4, the V. Army of Gen. Franchet d'Espérey had been ordered to close slightly to its left and to take up the general line Courtaçon–Esternay–Sezanne, so as to be ready to attack in a northerly direction. Some progress had been made in accordance with these orders on the 5th. On Sept. 6 the mission of the V. Army was to attack, in the general direction of Montmirail, with its right wing thrown forward, an operation designed to coincide with the advance of the VI. Army on the Ourcq, and to aim at enclosing the whole of the I. and portion of the II. Army of the Germans. Gen. Franchet d'Espérey sent forward his army at dawn. It was disposed, from left to right, as follows: the XVIII. Corps, III. Corps, I. Corps, X. Corps, with the reserve divs. in second line. Immediately a violent battle developed all along the line, due to the fact that the Germans had also received orders to advance and thus precipitated an encounter. In the fighting which ensued the French showed themselves undoubted masters of the enemy. On the left the XVIII. Corps seized Courtaçon during the day. It was assisted by Gen. Conneau's II. Cavalry Corps, which was operating on the left flank and maintaining touch with the British army, a task which it performed admirably, finally halting for the night on a line E. and W. through Choisy. In the centre, after a particularly fierce artillery preparation, the III. Corps seized the villages of Montceaux-les-Provins and Courgivaux. On the right the I. Corps gained possession of Chatillon-sur-Morin, which had defied their efforts for several hours, and after darkness had set in they continued their efforts, eventually clearing the Germans out of Esternay. From here the X. Corps carried on the line, with its right thrown well forward, and that flank gained touch with the 42nd and Moorish Divs. of the IX. Army at Villeneuve-lez-Charleville.

The fighting round Sezanne had been long and bitter. The Germans had placed many machine-guns in position, and they thoroughly searched the wooded ridges, from which the French attack was expected to develop, with artillery fire. The French guns replied and an artillery duel went on for some hours, until it seemed that the German guns had been silenced and that it was time for the French infantry to go forward. Against the green background the *pantalons rouges* of the attackers showed up like scarlet waves as they moved on with the bayonet, and with such a target the German machine-guns were able to do great execution. The French fell "like corn before the sickle," and to complete their discomfiture many were killed by the fire of their own artillery. The check to the French had, however, only been temporary, and after a day of brilliant fighting the front of the V. Army may be said to have been marked by the line Courtaçon–Esternay–Villeneuve-lez-Charleville.

The whole French countryside between Paris and Verdun was now ablaze, five French and one British army contending with the five German armies which had set out to pivot on Thionville and roll up the Allied line. South, too, of the fortress of Verdun the fighting round the Grand Couronné de Nancy, though not actually forming part of the series of battles included in the title of the Marne, nevertheless had a direct bearing upon it. For the moment, however, the interest in the struggle is confined to the fighting on the western flank within the area roughly marked out by the towns Betz–Meaux–Cou-

lommiers–Montmirail–Château-Thierry. In this great pocket Gen. von Kluck's soldiers were fighting desperately to hold off the converging attack of their opponents; while, on the side of the Allies, the French VI. Army, the British army and the French V. Army were struggling to nip the German I. Army from the main body of the enemy.

The fighting on the Ourcq on Sept. 7 was, therefore, to be hard and bitter. Each of the opposing commanders had special reasons for vigorous attack. On the French side Gen. Maunoury had rather overestimated the success, reported to him, of the V. Army of Gen. Franchet d'Espérey, and was inclined, in consequence, to believe that the Germans might fight merely a delaying action on the Ourcq. As a matter of fact the exact contrary was the case. Gen. von Kluck clearly realized that not only his task of safeguarding the right of the whole German advance but even the preservation of his own army depended on hurling back the attack launched from the direction of Paris. By an order issued at 5:30 P.M. on the 6th the IV. Corps was withdrawn across the Marne and hurried on through the night to reinforce the new front. Thus on the morning of Sept. 7 the II. Corps, the IV. Reserve Corps (still minus a brigade left at Brussels) and the IV. Corps stood between the Thérouane and the Gergogne (a tributary of the Ourcq), with their units intermingled, and covered on the N. by the 4th Cavalry Div. The original right flank had thus been strongly reinforced, but Gen. von Kluck felt that it was no time for half measures. Even at the cost of weakening himself elsewhere, even at the risk of creating a gap between his own and the II. Army, every man must be thrown upon the Ourcq. Merely to repulse the attack from Paris would not be sufficient; the French VI. Army must be defeated by an outflanking counter attack from the N., and accordingly the IX. and III. Corps were ordered to march early on the forenoon of the 7th in the direction of La Ferté–Milon–Crouy. These corps had, only the night before, been lent to Gen. von Bülow, but the II. Army commander had now perforce to send them off, though not without a protest. The effect of his action was that a gap, soon to yawn into 30 m., was opened between the I. and II. Armies, and into this gap the British army and the left of the French V. Army were rapidly moving. Gen. von Kluck now found himself committed to an isolated battle on the Ourcq, facing W. and with his left and rear exposed. Unless he could hold off Sir John French and Gen. Franchet d'Espérey sufficiently long to enable him to crush the French VI. Army and could then turn against the danger to his left and rear he was a beaten general. The task, however, was to prove too great. He had not the time necessary for the operation, and even if he had he had not the men for it.



So far as the actual fighting of the day is concerned the bulk of it fell upon the French VI. Army. Gen. Maunoury's left flank had been reinforced by Gen. Sordet's cavalry corps as well as by the 61st Reserve Div., which had been railed from Paris. At dawn the army was set in motion, and at first some progress was made, but gradually the weight of the reinforcements reaching the Germans began to tell. The II. and IV. Corps had now become available, and the various divisions had been thrown into the fight as they arrived, without regard to corps organization. Strong enemy columns debouched near Etavigny and Acy-en-Multien, and at the latter village the fighting was especially severe. As has so often happened on French battlefields the cemetery was the scene of desperate fighting, 500 dead being subsequently counted within an area of little more than 200 sq. yd. Around the farm of Nogeon, too—about half-way between Vinoy and Bouoflancy—the battle raged with particular fierceness, and the buildings changed hands several times throughout the day. Here a body of the French 298th Regt. fell to the last man, preferring death to surrender. Two companies of the [illegible] regiment after dark avenged the loss of their comrades by a desperate hand-to-hand attack, in which they captured a colour of the 38th Magdeburg Fusiliers decorated with the Iron Cross. After a day of hard fighting the French VI. Army had made some further progress, and its front ran generally from Chambry through Barcy, Marcilly, the high ground N.W. of Brunoy, Pusieux, Acy-en-Multien to the hill W. of Etavigny. The *moral* of the French facing the Ourcq at the close of Sept. 7 was high, and Gen. Maunoury determined to outflank Gen. von Kluck's right wing early next day with the I. Cavalry Corps and the 61st Div. As the German army commander was committed to a similar attempt to outflank the VI. Army's left the centre of gravity of the fighting in the western sector of the whole Marne battle was now unmistakably shifting to the neighbourhood of Betz.

The reinforcements hurried off to strengthen the German line upon the Ourcq had now left a comparatively small force to withstand the British. The task of holding back the army of Sir John French was now being carried out mainly by German cavalry, reinforced, as was the German custom, by Jäger battalions. In Gen. Joffre's initial orders for the battle the direction assigned for the advance of the British army had been practically due E., but the course of the battle since its opening necessitated a change in the original instructions. The French generalissimo had apparently visualized either a continuation of the German advance S. and S.E., or—in the event of a suspension of that operation—a withdrawal of the German I. Army towards the E.; but Gen. von Kluck had on the contrary shown every intention of pushing westwards so as to beat back the French VI. Army. In these circumstances it was clear that a more northerly advance would bring the British quickly on Gen. von Kluck's communications, and the necessary change was decided upon by the two Allied commanders. Orders were consequently issued by Sir John French directing the march upon the Grand Morin river, which was to be passed with all possible speed upon the 7th.

The British cavalry acted everywhere with great vigour, particularly on the right of the line where the 2nd Cavalry Brigade was operating beyond Dagny. At Moncel a spirited cavalry action took place, and a charge by a troop and a half of the 9th Lancers effectually dealt with a squadron of Guard Dragoons, the fate of the latter being sealed by dismounted-fire action of the 18th Hussars. Later a squadron of the 18th, holding a position dismounted, was charged by a German squadron, but by well-directed rifle fire the [illegible] were almost annihilated. A few passed through the firing-line but were accounted for by the horse-holders in rear. Thirty-two dead and wounded Germans were counted on the ground in front of the squadron, and of the 60 or [illegible] charged not more than a dozen escaped. By evening the bulk of the German cavalry had fallen back to the [illegible] Morin, S.E. of La Ferté-sous-Jouarre, and the British position was roughly as follows: on the left was the III. Corps about La Haute Maison; the II. Corps, in the centre, was round Aulnoy; and on the right flank the I. Corps lay about Chailly and Jouy-sur-Morin.

The French V. Army, no less than the British, felt the relaxation of pressure on its front caused by the withdrawal of German troops across the Marne, and the task of its left and centre was really one of pursuit, which was carried out in the general direction of Montmirail. The Germans held their ground stoutly, but finally the XVIII. and III. Corps were able to reach the general line La Ferté Gaucher–Trefols, which represented a gain of some six miles of ground. Farther to the right the fighting had been considerably more severe, for about noon Gen. Franchet d'Espérey had received word from Gen. Foch that the left of his (IX.) army was being violently attacked and was in sore need of assistance. The I. and X. Corps were, therefore, directed to go to the assistance of Gen. Foch.

By the evening of Sept. 7 the original orders of Gen. Joffre "*pour profiter de la situation aventurée de la I. Armée allemande*" were three days old, but that army was still in being and fighting tenaciously. Further, the geographical objectives alluded to by the French generalissimo were far from having been reached. The French VI. Army was to force the passage of the Ourcq and then to advance *en direction générale de Château-Thierry;* while the British army was to attack towards Montmirail. But by the evening of the 7th the passage of the Ourcq had still to be accomplished, and until that preliminary step had been taken Château-Thierry and Montmirail were mere names. A some-

what disquieting feature of the day, too, was the apparent intention of the Germans to make another effort to turn the Paris–Verdun line at Nancy and at Troyon, where a successful thrust would very seriously discount the French efforts on the Ourcq. Worse still, Maubeuge fell on the 7th, and the invaders not only gained another rail line of communication but had now another corps available for operations in the field. Against these drawbacks, however, could be set the fact that the gap between the German I. and II. Armies had considerably widened, and into it the British army and the left of the French V. Army were now advancing with speed.

During the night of the 7th–8th Gen. Galliéni took steps to reinforce Gen. Maunoury's army for the struggle which was expected after daybreak. The IV. Corps had been put at Gen. Galliéni's disposal by Gen. Joffre. Of its two divisions one—the 8th—had been acting as the liaison between the French VI. and the British armies, and by the evening of the 7th was in billets S. of Meaux. Orders were issued during the same evening for the remainder of the corps to proceed from Gagny to Gen. Maunoury's left wing, and the artillery and corps cavalry marched by road while the 7th Div. was transported to the neighbourhood of Nanteuil-le-Haudouin, one brigade by rail and the other in taxicabs, of which Gen. Galliéni had collected over a thousand.

Sept. 8 was remarkable for the violence of the German attacks along the Ourcq. Gen. Maunoury's plan was to attack with his right centre and left, while the VII. Corps in the centre was ordered to hold its line at all costs. That corps was heavily attacked early in the afternoon, and such was the severity of the fighting that a week later the streets of Etrepilly and Trocy were still blocked with the bodies of the slain. To the N. the French outflanking movement was brought to a standstill, while even the superb gallantry of the Zouaves of the 45th Div. on the right centre failed to make any considerable impression on the enemy. During the afternoon Gen. Galliéni visited the commander of the VI. Army at his headquarters at St. Soupplets and found Gen. Maunoury a prey to a certain depression of spirit. The military governor of Paris reassured him somewhat by pointing out that the greater the resistance offered by the Germans on the Ourcq the less opposition would the British meet with in their advance. Nevertheless, Gen. Maunoury considered it advisable to make arrangements for a possible withdrawal on the following day, indicating as the limit of retirement the line Le Plessis–Belleville–St. Soupplets–Monthyon.

Meanwhile, inexorably and methodically the British army was discounting the efforts which Gen. von Kluck was making W. of the Ourcq. After considering alternatives of action by which assistance could be rendered to the VI. Army, Sir John French decided that the best method implied the speedy passage of the Petit Morin and Marne rivers, for after passing the latter the British army would be facing N.W. and thus almost directly threatening the line of retreat of the German I. Army. Orders were accordingly issued for a general attack along the line of the Petit Morin, to begin early on the 8th. At first the march was undisturbed, but on reaching the Petit Morin it was soon realized that the German cavalry would not yield without a struggle, especially as the steep valley covered with small but thick woods distinctly favoured the defence. Some severe fighting ensued, but by evening the British had made good the Petit Morin and were on the line La Noue–Viels Maisons, where they joined up with the II. Cavalry Corps of the French V. Army, the left corps of which extended through Marchais-en-Brie to the southern outskirts of Montmirail.

Wednesday, Sept. 9—a day of high winds and drenching rains—was to witness Gen. von Kluck's last effort on the Ourcq. His IX. Corps was now in position to initiate an enveloping movement against the left of the French VI. Army. Gen. Maunoury's troops were at the end of their strength, and a determined attack delivered by the Germans from Betz and Authilly bore down the French resistance. The 8th Div. of the IV. Corps had been summoned from the Marne to reinforce the French left, but it could not be brought effectively into action, and as the 61st Res. and 7th Divs. and the VII. Corps failed to hold the Germans Nanteuil and Villers St. Genest were lost; but later, the 7th Div., in response to an urgent message from Gen. Maunoury about 6 P.M., faced about and struggled northwards towards Nanteuil, flanked by the I. Cavalry Corps. Gen. von Kluck, however, had shot his bolt. During the day the British army crossed the Marne, and on its right the XVIII. Corps of the French V. Army gained possession of Château-Thierry. Strangely enough the line of the Marne was not resolutely defended by the Germans, apparently through an error of judgment of the commander of a mixed detachment of the German IX. Corps, specially allotted to reinforce the cavalry already holding the crossings. Thus it came about that British columns advancing at dawn on the 9th found that not only were the bridges to the W. of Château-Thierry intact but that the enemy had made no attempt to hold this part of the Marne, and reports brought in by airmen all through the afternoon made it clear that the retreat of the German I. Army had begun.

So far this narrative of the battle of the Marne has dealt exclusively with the western section of the struggle, which took place, generally speaking, in the area bounded E. and W. by meridians drawn through Château-Thierry and Paris respectively. The story of the fighting must now be transferred to the centre of the whole battle-front, to which N. and S. lines through Château-Thierry and Châlons-sur-Marne form boundaries sufficiently accurate for our purpose.

The German Supreme Headquarters had ordered the I. and II. Armies to form front facing Paris, the former between Oise and Marne and the latter between Marne and Seine, Château-Thierry to be the point of junction of the two armies. This order had been disregarded by Gen. von Kluck, who had persisted in his passage over the Marne and in maintaining his position in front of the II. Army. Gen. von Bülow, however, endeavoured to comply with the orders of his superiors, and did make an effort to wheel his army to the right with the object of taking up the line Château-Thierry (exclusive)–Marigny-le-Grand. The net result of compliance with orders by one army commander and disregard of them by the other was that the right corps of the II. Army was squeezed out of the line by the left corps of the I. In other words, the two armies were acting upon different plans; overlapping had arisen; and the confusion inevitable in such circumstances began to be revealed upon the evening of Sept. 5.

This factor alone was bound to hamper the II. Army, and Gen. von Bülow's task was not lightened by the subsequent conduct of his neighbour. When Gen. von Kluck renounced his plunge S.E. he did it with such thoroughness as to lead to the transfer of practically his whole strength to the Ourcq. On Sept. 7 he demanded back the III. and IX. Corps which he had lent Gen. von Bülow but the day before. The withdrawal of these units to the Ourcq exposed Gen. von Bülow's right flank; a great gap was thus opened between the II. and I. Armies; and Gen. von Kluck, who had on the 5th inconvenienced Gen. von Bülow by his undue proximity, was now seriously embarrassing that commander by his aloofness.

This is, however, to anticipate matters somewhat. It is necessary to go back to the initial stages of the battle in the centre of the field, on Sept. 6. The substantial theatre of the struggle to be described was the area between the marshes of St. Gond and the Sezanne–Sommesous high road. The marshes had been largely reclaimed and canalized since they figured in Napoleon's great campaign exactly 100 years earlier; but in rainy weather traffic is limited to the three or four good roads crossing them, the chief of these leading from Epernay to Sezanne and Fère Champenoise respectively. The former road is commanded by Mondement and the latter by the high ground of Mont Août. Generally speaking, the task of the IX. Army of Gen. Foch for Sept. 6 was to support the advance of the V. Army with its left flank (which for this purpose had been pushed forward as far as Talus), while maintaining a watching attitude along the rest of its front. Gen. Foch, however, found himself quite unable to carry out even the moderate programme he had drawn up

Gen. von Bülow was endeavouring to wheel into position between Marne and Seine, and on his left the III. Army's orders were to push due south. As a result the French were attacked with considerable vigour all along the line; and so far from the 42nd and Moorish Divs. being able to gain ground on the left, they were forced to abandon Talus to the X. Corps of the German II. Army, and only managed to hold on to Villeneuve-lez-Charleville with some difficulty. The advanced guards of the IX. Corps fared no better against the left wing of the X. Corps and the Guard Corps of the II. Army, for they were driven from their line N. of the marshes and forced to fall back on the main body of the Corps, which, however, by holding the exits was able to maintain its position without difficulty. Farther to the E. the XI. Corps was violently assailed by the XII. Saxon Corps of the German III. Army, and had to swing back its left and take up a position with that flank in the woods S. of Ecury-le-Repos, while E. of Vatry the 9th Cavalry Div. was engaged throughout the day by Saxon cavalry. The close of the day's fighting found the French IX. Army on the line Villeneuve-lez-Charleville–southern edge of the marshes–Lenharée, in touch with the Germans all along the line, except where the marshes separated the two fronts.

Although the right of the German II. Army was becoming exposed, Gen. von Bülow on the 7th was still able to push on with his centre and left, that flank working in conjunction with the right of the III. Army. Gen. von Bülow's left was formed by the Prussian Guard Corps, and, as the III. Army consisted entirely of Saxon troops, memories of the concerted action at St. Privat on Aug. 18 1870 fired the German soldiers to press the French IX. Army to the utmost of their powers. The latter had in consequence to endure a series of very heavy attacks throughout the day. The significance of these efforts was not, however, lost on Gen. Foch, who shrewdly remarked that the very fury of the German onslaught was tantamount to an admission that things could not be going well with them elsewhere on their line. His own orders had contemplated the continuance of the offensive of the day before with his left, and briefly summarized they ran as follows: The 42nd and Moorish Divs. were to preserve connexion with the X. Corps of the V. Army on their left and were to endeavour to renew the offensive from Villeneuve-lez-Charleville towards the north-west. The IX. Corps was to maintain its hold upon the southern edge of the marshes of St. Gond, but was to be ready to advance without delay if called upon. The XI. Corps was to hold the line to which it had been forced back the evening before: but, like the IX. Corps, it was to be ready to advance if required, in which case it would be called upon to move round the eastern edge of the marshes; a reserve division was to be left about Lenharée to protect the right flank. The 9th Cavalry Div. was to be generally S. of the Sommesous–Vitry-le-François railway and was to keep touch with the left of the IV. Army about Humbauville.

Early in the morning the Germans attacked all along the line, and E. of the marshes German heavy artillery of the XII. Corps of the III. Army came into action, to which the French replied with similar pieces. E. of the marshes the outlying villages of Morains and Aulnay, held by advanced units of the IX. Corps, were taken by the Germans, the capture of the villages striking at the junction of the French IX. and XI. Corps, while on the left the 42nd and Moroccan Divs. were hard put to it to stave off the weight of the attacks of the German X. Corps. Here the château of Mondement, a two-story mansion dating from the sixteenth century, was recognized by both sides as a feature of outstanding tactical importance. Headquarters of the Moroccan Div. were shelled out of the building early in the day, but towards evening a combined attack of the 42nd and Moroccan Divs., with the 77th Regt. of the IX. Corps, restored the situation. Owing to this effect and thanks, too, to the assistance afforded by the X. Corps of the V. Army against Gen. von Bülow's exposed right, no ground was lost. So that, after a day of severe fighting, the Germans had made no impression on the French IX. Army, other than to deny it the possibility of making progress to the N. and W.

Before dawn on Sept. 8 from Mondement Hill the French observed enemy troops advancing to the attack. These, belonging to the X. and Guard Corps, were repulsed, and a counter-attack which gained a considerable amount of ground was made by the 42nd and Moroccan Divs., aided again by the 77th Regt. of the IX. Corps. Owing, however, to the unfavourable situation developing on the right of the IX. Army it was impossible to exploit this advantage, and a withdrawal was ordered. For, although immediately to the right of this action the IX. Corps still held the line of the southern edge of the St. Gond marshes, beyond that a somewhat serious situation for the French developed during the day. Attacked by the left wing of the Guard Corps of the German II. Army, and by two corps of the III. Saxon Army, the French XI. Corps was driven back as far as the line Cannantre–Corroy–Gourgançon, a circumstance which involved the transfer of Gen. Foch's headquarters from Pleure right back to Plancy on the Aube. Behind the stream La Maurienne, which runs across the greater portion of the front it had now taken up, the XI. Corps re-formed, and, aided by a counter-attack made by one of the reserve divisions with the IX. Army, it was enabled to advance and regain some high ground N. of Oeuvy. The situation had, however, been distinctly disquieting, and to a chief possessed of less imperturbability than Gen. Foch it might have seemed the prelude of disaster. On the extreme right the 9th Cavalry Div. about Mailly had maintained its close connexion with the IV. Army, and had supported an attack made by it near Sompuis.

In spite of the setback to his right during the 8th Gen. Foch was able to review the situation without alarm. The news which came in during the evening as to the progress of the battle E. and W. of him was reassuring. He learnt that the VI. Army, in spite of violent German counter-attacks, was holding its own upon the Ourcq, that the V. Army was making steady progress N.W. of the marshes of St. Gond, and that on his right the III. and IV. Armies were gaining ground towards Vitry-le-François and Châlons. His orders, issued shortly before midnight, prescribed generally the offensive for the coming day. The X. Corps, from the V. Army, was now definitely under his orders, and this access of strength prompted him to withdraw the 42nd Div. as a general reserve.

Once more was Mondement the scene of bitter fighting. It was seized at daybreak by a sudden German attack, and some hours later Mont Août also fell. Nevertheless, in spite of the disquieting events upon his left, Gen. Foch shortly after 10 A.M. directed the 42nd Div., which had now arrived on the line Linthes–Pleurs, to move farther to the right, where it was to take the offensive with the XI. Corps. The apparent audacity displayed in withdrawing the general reserve of his army from his shaken left to join in an attack from his right flank called forth paeans of praise from critics of the battle. Gen. Foch, however, realized that the danger to his left was more apparent than real. The V. Army, beyond that flank, had reached the line Marchais-en-Brie–Montmirail–right bank of the Petit Morin on the evening of the 8th, and with the great gap which now existed between the right of the German II. Army and Gen. von Kluck any movement of the former S. of Mondement was exceedingly unlikely. As a matter of fact Gen. von Bülow's increasing uneasiness as to the state of affairs had reached fever heat over reports as to the forcing of the line of the Marne by British troops during the 9th. He came to the conclusion that retreat was inevitable for Gen. von Kluck, and that, in these circumstances, his own II. Army must fall back at once if it were to avoid envelopment on its right flank. With the object of gaining time to get his long trains safely back over the Marne, the offensive by his left and centre was carried out with vigour during the morning, the French right being driven back to Salon; but early in the afternoon the German II. Army and the right of the III. Army were in full retreat, strong rearguards being left facing the French. Gen. von Bülow transferred his headquarters from Montmort to Epernay; and by evening, from Betz to beyond Fère Champenoise, the defeated German right and centre were falling back before the victorious Allies.

The operations of Gen. Foch's army in the centre of the battle of the Marne have been garnished with an embroidery of legend by which the real happenings in that portion of the field have been considerably obscured. He has been represented as being obsessed by an optimism so pronounced as to have led him to the issue of orders which, had they really been so framed, would have been unsoldierly bombast. The counter-attack which he conceived during the forenoon of the 9th has been written up as the decisive factor of the whole battle, "a wedge driven into the German centre" being the description of an operation which, when carried out eventually on Sept. 10, encountered nothing but the resistance of rearguards. And, for long, there persisted a thrilling narrative of the engulfment of thousands of Prussian Guards in the marshes of St. Gond. The operations of the Allies' left, though free from such distortions of truth, have by their dramatic decisiveness focussed upon themselves an immense amount of attention, particularly in England where the advance of the British over the Marne on Sept. 9 will rightly live in history as one of the most decisive achievements by British arms. Unfortunately, however, these results of the centre and left have tended to obscure the lesser known events upon the Allied right. The battle from Fère Champenoise to the Ourcq has somewhat diminished the lustre of the operations of the French armies from Vitry-le-François to Verdun. And yet in no quarter of the field was the fighting more severe. In no sector of the battle did the position of the Allied line present greater danger. Nowhere on the whole long front was the tenacity of the French III. and IV. Armies surpassed.

After the shipwreck of the high hopes on which they had entered France the German General Staff had yet one spar to cling to. While the IV. and V. Armies were to press southeastwards the VI. and VII. were to take the offensive against the line of the Moselle between Toul and Epinal, and these coördinated movements might yet bring off a great, if restricted, Sedan. The German idea was, therefore, to cut off Verdun on either side; the Crown Prince with his V. Army was to proceed round the entrenched camp by the W.; the IV. Army with its right passing through Vitry-le-François was to bear down across the flatlands of Champagne; on the other side the VI. and VII. Armies were to advance eastwards over the Moselle. Inside this great converging movement the I., II., III., and IV. Armies of the French might be herded together and destroyed. Had these four French armies been able to unite their efforts to a common end their position would have been less full of risk. Such, however, was not the case. The action of Gen. Sarrail's III. Army was to be coördinated rather with that of Gen. Maunoury on the Ourcq than with that of the French II. Army in front of Nancy. In the original orders for the battle of the Marne Gen. Sarrail was to strike westward against the Crown Prince's flank in a movement reciprocal to that by which Gen. Maunoury struck against von Kluck; and this movement, although it would assist in a double flanking movement against the whole German mass between Paris and Verdun, had the disadvantage that it ignored the danger to the III. Army's rear. Behind Gen. Sarrail was the Meuse, held only by a chain of semi-obsolete *forts d'arrêt*, and but a few miles farther E. was the great fortress of Metz, within which very large forces might be accumulating from all parts of Germany. The concealment afforded by a large fortress is apt to have a disconcerting effect upon an enemy operating in the vicinity. Paris had surprised the Germans by emitting a strong field army at the critical moment, and it was not impossible that Gen. Sarrail might find himself exposed to a similar danger.

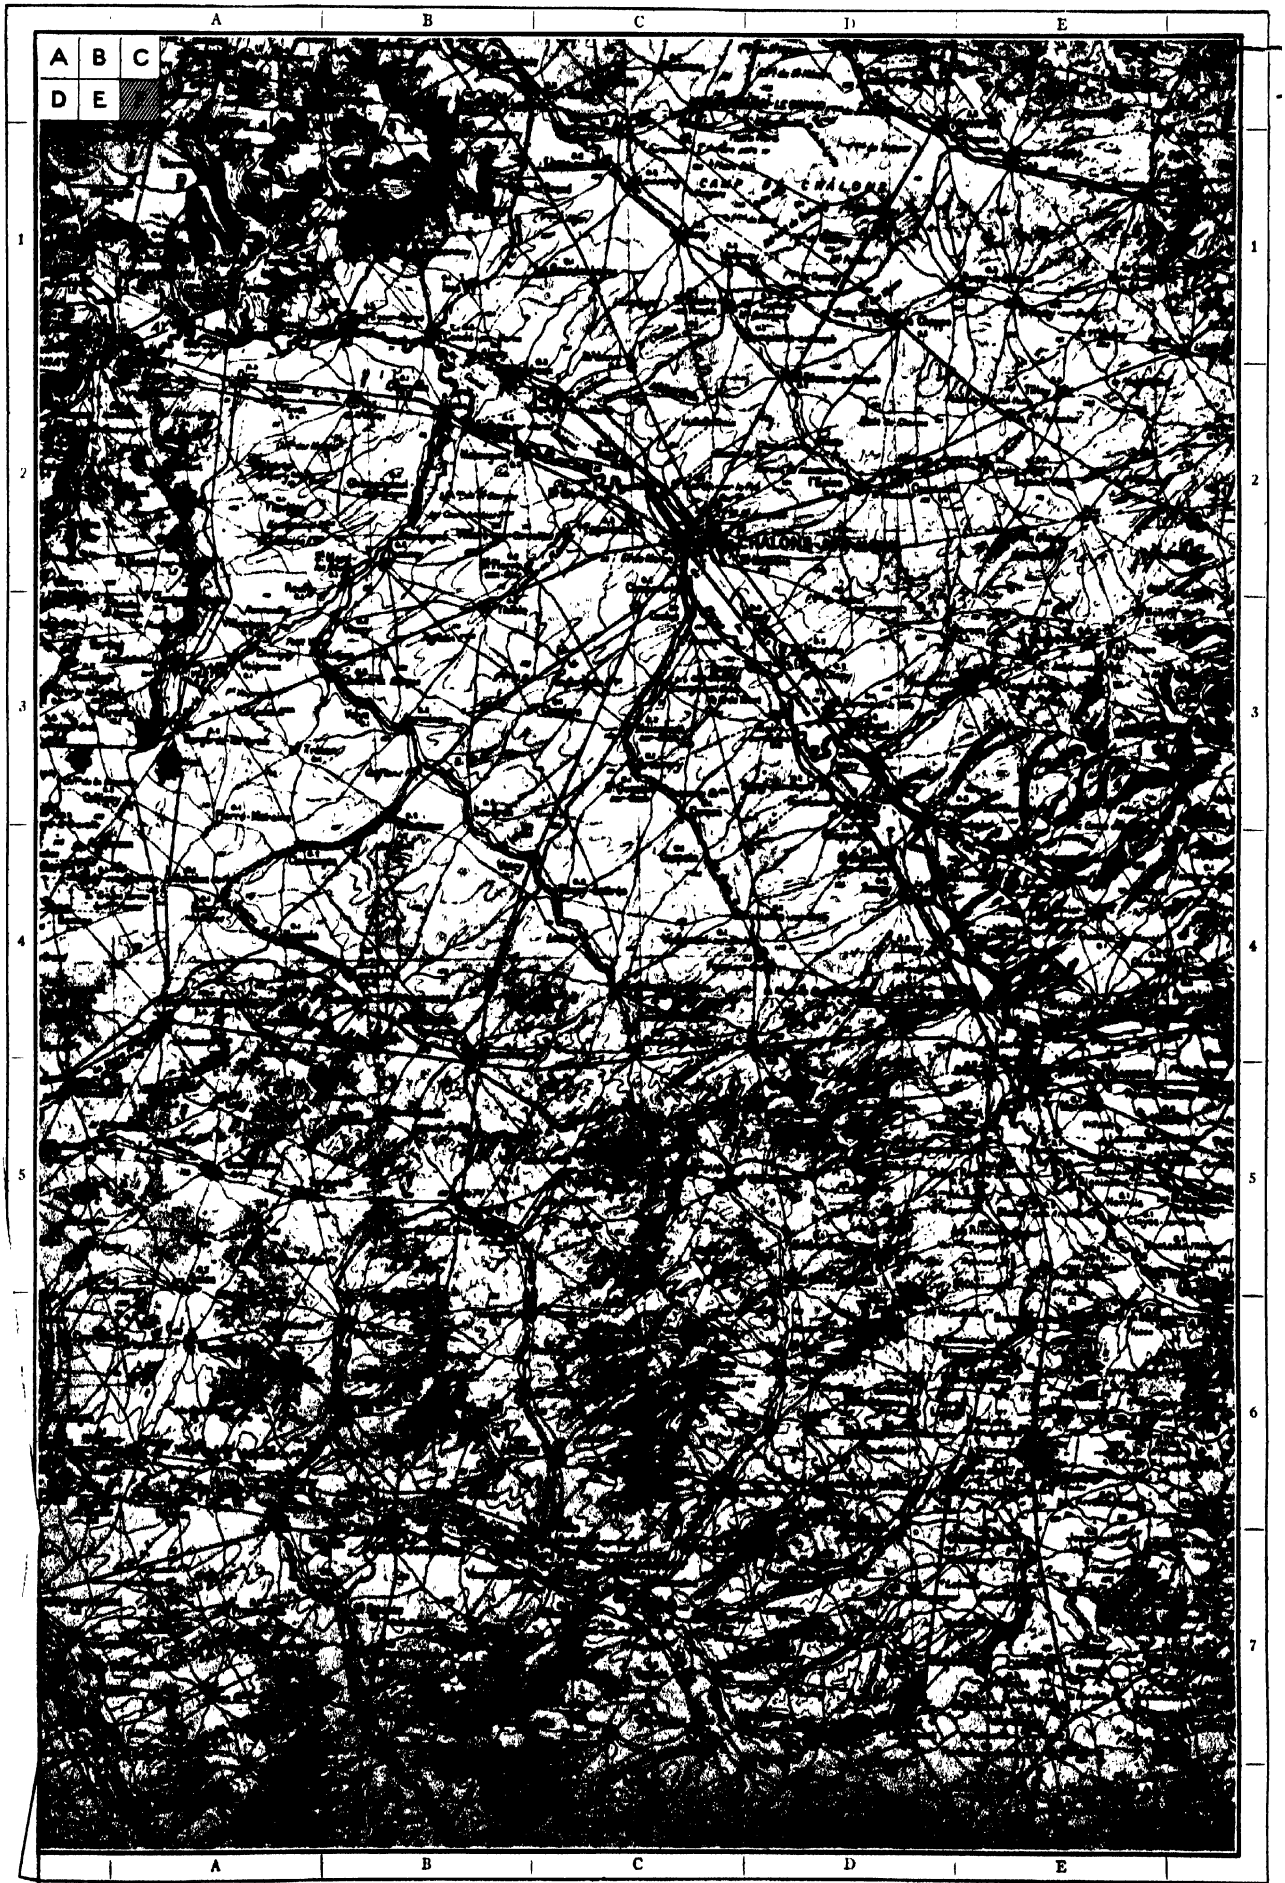
Fortunately for the French the German Crown Prince based his advance upon a misconception. He considered that Verdun would be left to its fate, and in his orders of the 5th prescribed the advance of his army on the following day to the line Revigny–Bar le Duc. Gen. Sarrail, however, all through the battle kept hold of the fortress with his right; and, further, he arranged with the fortress commander for the coöperation of the mobile garrison with his army, with the result that the Crown Prince, far from being in a position to plunge due S., found himself compelled to face generally to the E., while his communications now ran roughly parallel to his front, a disadvantage which needs no comment.

When we come to the details of the struggle in this eastern sector of the battle it must be remembered that the French IV. Army had opposite to it the left of the enemy's III. and the whole of the IV. Army under the Duke of Württemberg. Each side had been ordered to attack, and fighting of a particularly severe nature ensued. On the eve of the battle the line of the French IV. Army had run generally from the vicinity of Sompuis on the left, S. of Vitry-le-François, to Sermaize upon the right, and when retreat set in on the German side the French IV. Army was practically on the same line as that from which it had started the battle. That it was able to maintain its position against the heavy attacks launched upon it was due to the tenacity of its units, and also to the fact that, on the 9th, it was reinforced and its left strengthened by the XXI. Corps from the I. Army on the extreme French right. When the battle opened the IV. Army was not very favourably placed for assuming the offensive, for, although it was in touch with the III. Army to the right, there was a wide gap between its left and the right of Gen. Foch's IX. Army at Lenharée, which was only imperfectly filled by the 9th Cavalry Div. This fact enabled the Germans to reinforce their own left, with the result that Sermaize was taken on the 7th, and for a time there was a serious risk that the right flank of the IV. Army might be rolled up. Gen. Langle de Cary was compelled to call upon the III. Army for assistance. Throughout the 8th the IV. Army was overlapped on either flank, but eventually the arrival of the XXI. Corps from the Vosges restored the situation, and upon the 9th Gen. Langle de Cary was able to reinforce his left centre by two more divisions. The fighting had been hard and bitter, and even as late as nightfall on Sept. 9 there was no indication of the Allied victory now clearly revealed in the centre and west.

In Gen. Joffre's instructions of Sept. 1 the limit of the *mouvement de recul* behind the Seine implied the march of the French III. Army to the country N. of Bar-le-Duc, and on the following day it was thought that the III. Army might possibly have to fall back as far as Joinville. Gen. Sarrail was strongly opposed to the isolation of the fortress of Verdun, which would result from a complete obedience to the orders of the generalissimo, and took it upon himself to maintain his right in touch with the fortress while refusing his left, and thus bringing his front on to an alignment generally facing west. This attitude on the part of Gen. Sarrail fitted in admirably with the resolution of Gen. Joffre to suspend his retreat and to pass to the offensive. The commander of the III. Army, having refused to separate his right from Verdun, now resolved to issue a positive order to the fortress commander (Gen. Coutanceau) to coöperate with his garrison. The latter, although he might have stood upon his rights as regards the troops allotted for the defence of the place for which he was responsible, felt that his clear duty was to comply. He moved out the 72nd Reserve Div. S.W. of the fortress, and on Sept. 6 these troops attacked enemy trains and parks and threw them into considerable confusion.

The orders to Gen. Sarrail of Sept. 5 directed him to attack westwards, but reconnaissance having established the advance of strong enemy forces E. of the Argonne the sense of the order had to be reversed; for, to avoid exposing his own communications, Gen. Sarrail considered it advisable to attack in a northerly direction with the bulk of his army while maintaining the remainder on the defensive facing W. This led to some friction with French General Headquarters, whose appreciation of the situation led to what was tantamount to an order to assist the IV. Army even at the expense of leaving Verdun to its resources. Gen. Sarrail was thus in a position of having either to act against his better judgment or to disobey formal orders; luckily the arrival of the XV. Corps—from the II. Army—enabled him to give satisfaction to Headquarters without having to quit his hold upon Verdun.

In the midst of the difficulties caused by severe fighting with the enemy and by the fettering orders of Headquarters Gen.



Sarrail was called upon to deal with a new peril. Early in the afternoon of the 8th a message was received saying: "Fort Troyon violently bombarded this morning by heavy guns of large calibre." The despatch closed with the ominous statement that the state of affairs was critical, and that 48 hours was all the commandant expected to be able to hold out. The situation of Gen. Sarrail was now exceedingly serious. Very violent attacks were in progress against his right and centre; his left was in danger of being rolled up; and now this new peril threatened his rear. Fort Troyon was a small work dating from 1879, of practically obsolete design, the armament of which consisted of four medium guns, twelve smaller, and a couple of mortars, while the garrison numbered some 350 of all ranks. The bombardment was to last for four days—from the 8th to the 12th—and was then succeeded by a thrust which created the well-known St. Mihiel salient, destined to remain as a dent in the French line until it was flattened out by the Americans four years later. Here it is only necessary to say that the garrison of Fort Troyon put up a stout resistance, and that the fortifications, obsolete though they were, proved sufficient to keep the casualties of the defenders surprisingly low. On the 10th the place was relieved by the arrival of a French cavalry division from Toul; and although upon the following day the Germans renewed their attacks upon it these had lost most of their significance. From Verdun to Paris the five German armies were in full retreat in the centre, and on the right and on the left were manœuvring to conform to the retirement. The great battle of the Marne had been fought and won.

So far in this narrative of the battle, beyond the mere mention of the retirement of the German right and centre, no reference has been made as to how, when and why the decision to break off the fight was arrived at. For long the matter was one of some perplexity, and rumours were circulated by the Germans that the Saxon III. Army, in the centre of the line, had failed, and by its failure had frustrated the efforts of the Prussians to the E. and W. Recent German literature has dispelled this unjust legend and has allowed the truth to be known. In the German army, so far back as 1870, liaison officers were a distinctive feature of the Higher Command. These were not mere messengers; they were expected to explain orders, and even, within limits, to give orders in the name of the chief of the General Staff. During the battle of the Marne Supreme Headquarters were over 100 m. in rear, and the slow working of the wireless apparatus brought it about that by the 8th von Moltke had completely lost his grip of the battle. In these circumstances a liaison officer—Lt.-Col. Hentsch—was directed to visit the V., IV., III., II. and I. Armies, and to bring back a clear idea of the situation. Should he find that a retrograde movement had already been initiated on the right wing he was instructed to issue such orders as would close the gap between the II. and I. Armies. During the 8th Lt.-Col. Hentsch visited headquarters of the V., IV., and III. Armies, and spent the night at headquarters of the II. Army. During the forenoon of the following day Gen. von Bülow was considerably disconcerted by the passage of British columns over the Marne, and came to the conclusion that a retreat on the part of the I. Army was now inevitable and that his own II. Army must also fall back if its right flank were not to be enveloped. Lt.-Col. Hentsch agreed with the conclusion, and proceeded then by motor-car to the headquarters of the I. Army at Mareuil. Gen. von Kluck was absent at the time, and it was his chief-of-staff, Gen. von Kuhl, with whom the liaison officer conferred. His view of the whole general situation was unfavourable, and he gave it as his opinion that the I. Army must fall back. Gen. von Kuhl pointed out the difficulty of breaking off the fight, and also argued that there was still a fair prospect of defeating the French troops on the Ourcq, but in face of the absolutely full powers of Lt.-Col. Hentsch there was nothing to be done but to break off the action and order the withdrawal of the I. Army towards the north. Gen. von Bülow had meanwhile telegraphed to the III. Army on his left notifying his retirement, and that army had no option but to comply with the general retrograde movement. Thus, by the late afternoon of the 9th, the whole right and right centre of the German army was falling back. Supreme Headquarters, in ignorance of the fact, had meanwhile prepared instructions for a continuance of the offensive, but events were too strong for them. It was found necessary to bow to the inevitable, and orders were issued during the evening of the 10th for the retreat of all five armies behind the line of the Aisne and Vesle. As to the necessity of renouncing the offensive at this stage opinions are, and will possibly ever remain, at variance. Historical unanimity will, however, probably be reached on two factors—the ineptitude of higher "staff work" on the German side and the serious drawback caused by the absence of a general reserve by which the situation might have been restored upon Sept. 9.

The conduct of Gen. von Kluck had not apparently satisfied Supreme Headquarters, and his army was placed "until further orders" under the command of Gen. von Bülow. On the 11th some considerable anxiety was felt upon the German side over the possibility of a French thrust against the centre, and a modification was made to the orders issued the previous day, by which the line of the III., IV. and V. Armies was to be Thuizy–Suippes–St. Menehould and E. of the latter place. A new VII. Army was formed from the XV. Corps—from the original army of that number in Alsace—and the VII. Reserve Corps set free by the fall of Maubeuge. These units were due to reach the area St. Quentin–Sissy about midday on the 12th, and this army was, like the I., also placed under the orders of Gen. von Bülow. The German right wing fell back in good order but in considerable haste, and on the 12th the I. Army was behind the Aisne on the line Attichy–Soissons–Vailly. The French VI. Army, following up through the forest of Compiègne, crossed the river on the following day, while farther E. of this sector an advanced guard of the British 4th Div. seized the bridge at Venizel and moved forward to the crest of the plateau beyond. On the following morning the battle of the Aisne opened for the British army, and the river line was attacked all along the British front. By nightfall all passages except that at Condé were secured and held, and during the hours of darkness all three corps had constructed bridges, the crossing being completed in the face of considerable opposition during Sept. 14.

The gap which had existed between the German I. and II. Armies during the battle of the Marne was still unclosed when the position behind the Aisne was taken up by the German right. Once again the persistent British columns scared Gen. von Bülow; but, luckily for him, reinforcements were available, since the VII. Army was now coming to hand, and during the night of the 12th and 13th units of the VII. Reserve Corps were hurried down from the neighbourhood of St. Quentin to fill the gap, achieving their object by the narrowest possible margin of time. This reinforcement, which had such an appreciable effect upon the battle of the Aisne, deserves something more than casual mention. On Sept. 9 the VII. Reserve Corps, leaving a detachment at Maubeuge, was ordered N. against the English reinforcements supposed to be advancing from the Flanders coast against Brussels or Antwerp; later in the day a counter order came for it to march S. towards La Fère, as the situation on the Marne was more strained than even that in the north. At 10 A.M. on the 12th, when near Guise, further orders came for the corps to turn off towards Laon at once. The intelligence that arrived from Gen. von Bülow was so alarming that Gen. von Zwehl, the corps commander, marched his divisions on all through the night, rested from about 7 to 10 A.M. and then pressed on again. Thus he managed to arrive on the Chemin des Dames by 2.30 P.M. (British time), and little more than an hour later the leading infantry brigade of the British I. Corps was near Moulins, a mile short of the top of the ridge.

The Allied centre did not experience much opposition in the advance, but on the right the German V. Army gave more trouble. As the pivot of the great German wheel-back the rôle of the Crown Prince was to mark time, and the duty was carried out with some skill. By the 14th he was on his assigned position. In the temporary deadlock now brought about by the

occupation, by the Germans, of a defensive position, each side began the attempt of outflanking the other on the W., with the result that the German front by Sept. 16 was thus traced out:—the neighbourhood of Noyon, the plateaus S. of Vic-sur-Aisne and Soissons, the tableland of Laon, the heights N. and W. of Reims, Ville-sur-Tourbe (N. of), Varennes, to the Meuse near Forges Wood, N. of Verdun.

Mention has been made of German operations, after the battle of the Marne, S. of Verdun, and a brief narrative of them is now required. The brilliant defence made by the French III. Army about Verdun was followed a few days later by a mishap. Thenceforward, until the American offensive in 1918, there existed the "pocket of St. Mihiel," a salient jutting into the French position which affected the course of operations throughout the war in the Verdun–Epinal area.

Owing to the exhaustion of the corps of the French III. Army the pursuit of the German V. Army after the battle of the Marne was not pressed; the main body of the French III. Army halted abreast and W. of Verdun, while its VI. Corps and Gen. Durand's group (the 65th, 67th and 75th Res. Divs.) passed through Verdun and crossed to the right bank of the Meuse. On the 16th the VI. Corps was to move N. towards Mangiennes, while Gen. Durand's three divisions marched parallel and E. of it from Etain towards Spincourt. Thus Gen. Sarrail had divided his army into two parts, separated by the Meuse, and while the right of the III. Army was advancing northwards on a broad front E. of the Meuse by Mangiennes and Spincourt, three German corps, the XIV., Bavarian III. and V. Reserve were moving from W. and S.W. of Metz to attack westwards behind it, in the general direction Toul–St. Mihiel.

The defence of the Hauts-de-Meuse was at this time changing hands. The II. Army was in the process of entrainment on its way to the western flank to extend the battle-front E. of Amiens. The VIII. Corps, however, which had been transferred from the I. to the II. Army on Sept. 15, and had taken over the defence of part of the Hauts-de-Meuse, was at first left in position, but on the 19th it was ordered by the French Higher Command to entrain at once for St. Menehould, whence it was to be transported to join the VI. Army N. of Paris, thus creating a gap which Gen. Sarrail could not fill.

In the meantime, the three reserve divisions were sent off to hold the Hauts-de-Meuse on a broad front between Dieppe, E. of Verdun, and Vigneulles, N.E. of St. Mihiel. The three divisions were thus extended over a front of 20 m., with a wide gap of six miles between Grimaucourt and Tresauvoux. With the VI. Corps Gen. Sarrail intended to retake Etain, and did not appear to suspect the danger approaching the Hauts-de-Meuse farther S.; behind the long screen of the reserve divisions along the Hauts-de-Meuse he had no mass of manœuvre in reserve to meet the unexpected. The gap in the battle-front created by the withdrawal of the VIII. Corps from in front of St. Mihiel therefore remained unfilled.

The Bavarian III. Corps advancing westwards towards Vigneulles and St. Mihiel, N. of the XIV. Corps, therefore found the way practically open for it. On Sept. 20, at 8:30 A.M., Hattonchatel, Hattonville, and Vigneulles were bombarded, and at 5 P.M. the Bavarians entered Vigneulles. During the night Hattonchatel was taken without resistance being offered, and the French retired in disorder on St. Mihiel, abandoning the Hauts-de-Meuse to the Bavarian III. Corps, who were astonished at such an easy victory. The enemy by the morning of the 21st held the entire sector of the Hauts-de-Meuse between Combres and Heudicourt, a front of 12 miles.

On the 21st Gen. Sarrail issued orders for the recapture of the lost sector of the Hauts-de-Meuse, but was unable to stop the German offensive on the right bank of the Meuse from Vigneulles on St. Mihiel. He was, however, more successful on the left bank. On the 24th the 65th Res. Div. was brought down by rail from Verdun towards St. Mihiel. It had to detrain at Woimbey, and thence marched to Rupt on the St. Mihiel–Bar-le-Duc road. Here it was rejoined by the remnants of the 75th Div. from the right bank. These two divisions held up the German advance along the Bar-le-Duc road and forced it back on Chauvoncourt. The VI. Corps, with the 65th Div., was able to remain on the right bank of the Meuse, its front running obliquely from Maizey to St. Remy. It was, however, unable to cut the German communications between St. Mihiel and Vigneulles; and the situation established on Sept. 24 1914 remained unchanged for over three years. (F. E. W.*)

**MARQUESTE, LAURENT HONORÉ** (1848–1920), French sculptor, was born at Toulouse June 12 1848. He was a pupil of Jouffroy and Falguière, and won the Prix de Rome in 1871. In 1893 he became a professor at the École des Beaux Arts. He became a member of the Institute in 1894, having received the Legion of Honour in 1884, and being made officer in 1894, and commander in 1903. His works include a large number of statues which decorate the monuments and buildings of Paris, including Victor Hugo for the Sorbonne (1901) and others for the monumental Quai d'Orsay station, the Collège des Beaux Arts, the Grand Palais, and the Hotel Dufayel in Paris, which was very much criticised; as well as monuments for North and South America. He is also the author of "La Cigale" (1900), statues of Victor Hugo, Léo Delibes, Ferdinand Fabre, and many others, besides "Galatea" (*see* 24.496, Pl. VII.) and a large output of classical subjects. He gained the Grand Prix at the Universal Exhibition of 1900. He died in Paris April 5 1920.

**MARSCHALL VON BIEBERSTEIN, BARON ADOLF VON** (1842–1912), German diplomatist, was born at Carlsruhe Oct. 12 1842, his father—Augustus, Baron Marschall von Bieberstein—being chamberlain to the Grand Duke of Baden, and his mother before her marriage Baroness von Falkenstein. He was educated at the *Gymnasium* of Frankfort-on-Main and at the universities of Heidelberg and Berlin. He studied law and from 1871 to 1882 held various administrative offices in the Grand Duchy of Baden. From 1875 to 1883 he sat in the Upper Chamber of the Baden Diet. In 1883 he was sent to Berlin as minister for Baden in the Federal Council and from 1884 to 1890 he represented the Council in the Imperial Insurance Office. In 1890 he succeeded Count Herbert Bismarck as Secretary for Foreign Affairs under the Caprivi chancellorship and continued to hold that office under Prince von Hohenlohe; but he had incurred the enmity of Prince Bismarck by refusing his advice when he first assumed office, and the result was a fierce press campaign against him which finally obliged him to speak out when he appeared as a witness at the trial of certain journalists in 1896 for *lèse-majesté*. He was also violently opposed by the Agrarians because he advocated the reduction of corn duties, and in 1897 he resigned office, and a few months later was appointed German ambassador in Constantinople. There he remained for nearly 15 years, creating a commanding position for himself and a growing ascendancy in Turkish affairs for his Government. To him was largely due the promotion of the Bagdad railway. In general European politics Baron Marschall had taken during his Foreign Secretaryship a strongly imperialist attitude. After the Jameson raid and the Emperor's telegram to President Krüger, in the drafting of which Baron Marschall, according to the later testimony now available, bore a leading part, it was he who declared in the Reichstag that the maintenance of the independence of the Boer republics was a "German interest." He was also an advocate of a strong naval policy for Germany. In 1907 he was principal German delegate in the Hague Conference, and was the exponent of Germany's resolute and successful opposition to any practical discussion of the question of restriction of armaments. In May 1912 he was appointed to succeed Count Wolff-Metternich as ambassador to Great Britain, but he had only been in London a short time when his health finally broke down. He died at Badenweiler Sept. 24 1912.

**MARSH, CATHARINE** (1818–1912), English philanthropic worker, was born at Colchester Sept. 15 1818, being the child of an evangelical clergyman, sometime rector of Beckenham. In company with her father she did remarkable pioneer missionary work amongst navvies. She wrote *Memorials of Captain Hedley Vicars* (1856), an account of the officer-missionary who was killed in the trenches before Sevastopol, and *English Hearts*

*and English Hands* (1858), a description of her own work with the navvies. She died in London Dec. 12 1912.

**MARSHALL, ALFRED** (1842– ), English economist (*see* 17.770), produced a memorandum for the Government on the Fiscal Policy of International Trade in 1908. In 1919 he published *Industry and Trade* (vol. 1., 4th ed. 1921). All his work since the publication of his first book in 1879 was done in conjunction with his wife Mary, daughter of the Rev. Thomas Paley, whom he married in 1877. She was one of the first women students at Cambridge, and was highly commended for her work in the Moral Sciences tripos in 1874. In 1875 she became resident lecturer at Newnham Hall, when it was first opened under Miss A. J. Clough, resigning this post on her marriage.

**MARSHALL, THOMAS RILEY** (1854– ), American politician, was born at North Manchester, Ind., March 14 1854. He was educated at Wabash College (A.B. 1873; A.M. 1876) and was admitted to the bar in 1875. From 1876 to 1909 he practised law in Columbia City, Ind., and from 1909 to 1913 was governor of Indiana. He was nominated for vice-president on the ticket with Woodrow Wilson at the Democratic National Convention in 1912 and was elected. He was again nominated with President Wilson in 1916 and elected for the term 1917–21. For almost two years after the outbreak of the World War he urged strict neutrality, but in 1918 publicly expressed regret for this attitude. In 1919 he welcomed the King and Queen of Belgium on their visit to Washington during the illness of President Wilson. He was a strong advocate of the League of Nations, but did not favour woman suffrage.

**MARSHALL, SIR WILLIAM RAINE** (1865– ), British general, was born Oct. 29 1865, and entered the army in 1886. He saw considerable service in the 1897–8 campaign on the N.W. frontier of India and with mounted infantry in the S. African War 1899–1902. He was promoted full colonel in 1908, and in 1912 he obtained command of a battalion in India. Returning with his unit to England soon after the outbreak of the World War he took it over to France, but he was almost immediately recalled to take up command of the 86th Brigade of the 29th Division in England, and early in 1915 he proceeded with it to the Dardanelles. It took part in the famous landing of April 25 at Helles and saw much hard fighting. Marshall was promoted major-general for distinguished service in June; he was afterwards in temporary command of different divisions in the Gallipoli Peninsula, and at the evacuation of Suvla he was in charge of the beach work. He was then transferred to the 27th Division at Salonika and served there until Sept. 1915, when he was chosen to command an army corps that was being organized in Mesopotamia. In the memorable campaign conducted by Sir F. S. Maude, by which Kut was recovered and Bagdad taken, his corps gradually cleared the right bank of the Tigris to some distance above Kut, and then forced a passage over the river in defiance of the Turks. His troops led the advance to Bagdad, and after its fall in March 1917 he inflicted a number of heavy defeats upon the enemy to the north of the city. On Sir Stanley Maude's death in Nov. 1917 Sir William Marshall—who had been given the K.C.B. for his services as a corps commander—succeeded to the chief command. During the ensuing cold season he considerably extended the area under the control of his troops, and on favourable weather again setting in a portion of his army virtually annihilated what was left of the Turkish field forces in Mesopotamia at Kala Shergaat, thus bringing the campaign to a triumphant close. In recognition of his great services Marshall had been promoted lieutenant-general, and he now received the G.C.M.G. At the end of 1919 he took up the command of the Southern Army in India.

**MARYLAND** (*see* 17.827).—The pop. in 1920 was 1,449,661, as compared with 1,295,346 in 1910, an increase of 11·9% as opposed to 9% in the previous decade. In 1920 the urban pop. of Maryland (that is, residents of towns of 2,500 inhabitants or more) was 869,492 while the rural pop. was 580,239, or 60% urban instead of 59·8% in 1910, the first year in which urban exceeded rural. A part of this increase of urban population may be accounted for by the annexation of portions of Baltimore and Anne Arundel counties to Baltimore city in 1918 (*see* BALTIMORE) by which the population of Baltimore received more than the normal increase for the decade.

The population of those cities in Maryland having more than 11,000 inhabitants and the percentage of increase for the decade was as follows:—

| | 1920 | 1910 | Increase per cent. |
|---|---|---|---|
| Baltimore | 733,826 | 558,485 | 31·4 |
| Cumberland | 29,837 | 21,839 | 36·6 |
| Hagerstown | 28,066 | 16,507 | 70·0 |
| Annapolis | 11,214 | 8,609 | 30·3 |
| Frederick | 11,066 | 10,411 | 6·3 |

The greatest percentage of increase over the preceding census in the case of any of these cities was the 70% (11,559 in number) of Hagerstown, an important railway and manufacturing centre of the Cumberland valley.

*Agriculture.*—In 1910, 48,923 farms occupied 5,057,140 ac. or 79·5% of the total land area of Maryland, of which acreage 3,354,767 or 66·3% were improved lands. The slow transition of the state from an agricultural to a manufacturing community is manifested in a comparison of these figures with those for 1920, in which year there were reported 47,908 farms, taking up 4,757,999 ac. or 74·8% of the total land area, and showing 3,136,728 or 65·9% in improved lands. There were 1,015 or 2·1% fewer farms in 1920 than in 1910, a decrease of 5·9% in total acreage and 6·5% in the acreage of improved land. In the same period in which this decrease in acreage occurred (1910–20), the value of all farm property in the state rose from $286,167,028 to $463,638,120; of the average value of a farm from $5,849 to $9,678. The total farm value in 1920 comprised $386,596,850 in lands and buildings, $28,970,020 in implements and $48,071,250 in live stock. The average number of ac. per farm decreased from 103·4 in 1910 to 99·3 in 1920. The largest single group in the classification by acreage was that of farms having from 100 to 174 ac. each, which represented 23·3% of the whole number. The average value per ac. of all farm property in 1920 was $97.44 instead of $56.59 as in 1910, and of land alone was $54.62 instead of $32.32. Of the total number of farms, 41,699 were operated by white farmers and 6,209 by coloured farmers, a decrease in the first class of 2%, in the second class of 2·6%.

Of domestic animals on Maryland farms in 1920, the total value was $43,784,464; of poultry, $4,216,105. The number of horses, 141,341, was 5·5% smaller than in 1910, but the number of mules reported, 32,621, showed an increase of 45·8%. There were 283,377 cattle on the farms, an increase of 13·9%, and of these 188,537 were reported as dairy cows (including heifers one year old and over), an increase of 21,678 or 13%. The total farm value of Maryland dairy products in 1919, excluding products consumed on the farms, was $13,407,526 as against $5,480,900 in 1909, an increase of 144·6%. In spite of the decrease in improved lands in 1919 as compared with 1909, the crop acreage in the former year was 1,988,120 as opposed to 1,927,254 in the latter. The total value of all crops in 1909 was $40,330,688, a figure which under the increased production brought about by the World War rose to $122,368,000 in 1918 but fell to $109,811,164 in 1919. The leading products in value in 1909 were cereals (Indian corn and wheat), hay and forage, vegetables, fruits and nuts and tobacco. The corn acreage of Maryland fell from 647,012 in 1909 (value of crop $11,015,298) to 619,265 (value of crop $32,678,769) in 1919. In the same period the wheat acreage rose from 589,893 (value of crop $9,876,480) to 664,295 (value of crop $21,357,568). The acreage of hay and forage showed 662,939 in 1919 as against 398,892 in 1909, while tobacco with an acreage of 28,550 in 1919 as against 26,072 in 1909 showed an increase in value of 292·6% or the difference between $5,721,164 and $1,457,112. Oats, wheat and tobacco showed a decrease in their average yield per ac., while corn, hay and Irish potatoes showed an increase. The total vegetable acreage in 1919 was 165,106, of which 58,083 was in tomatoes; the value of the vegetable crop was $25,371,723. The total small fruit acreage fell from 16,595 in 1909 (14,292 in strawberries) to 8,360 (7,096 in strawberries) in 1919; a less noticeable decrease occurred in the orchard fruit crop.

*Minerals and Manufactures.*—The value of the products of all mines and quarries in Maryland in 1909 was $5,782,045, of which amount $4,483,137, or 77·5%, represented the value of the products of bituminous coal-fields; $1,075,726 the product of stone-quarries; the small remainder the product of iron-mines, clay-pits and various other relatively unimportant sources. The total operating expense of the mining industries in 1909 was only $775,888 less than the value of the whole product, but the excess of value over cost in the case of bituminous coal was $541,778. Granite, traprock, limestone and slate, in the order named, came after bituminous coal in value of their product. In 1910 there were mined in Maryland 4,658,147 long tons of bituminous coal, an output which declined steadily until it reached 3,690,667 long tons in 1914, when it began to increase, and in 1918 the output was 4,015,444 long tons, a slightly smaller tonnage than in the previous year. The value of the stone-quarries, excluding marble, in 1916 was $934,130 as opposed to $1,075,726 in

1909. The value of products manufactured from mines and quarries in 1916 was, for brick and tile $1,908,537, lime and cement $2,332,846. The pig-iron production of Maryland furnaces rose from 290,073 tons in 1900 to 501,452 in 1916, and fell from this point to 244,002 in 1919.

The total value of Maryland manufactures in 1909 was $315,669,150 and in 1914 $377,749,078, a sum which placed the state 14th in the Union in value of manufactured goods. Of the amount named $215,171,530 was the product of Baltimore plants alone. In the entire state there were in 1914 131,391 persons engaged in manufacturing industries, and $293,210,925 invested in capital. Baltimore ranked as sixth city in the number of establishments in operation. In the period 1909–14, the value of Maryland manufactures advanced 19·7%, and in general the figures indicate an increasing value in manufactured products, as contrasted with a less satisfactory progress in the yield of natural resources. In both 1909 and 1914 the value of the following six industries exceeded $10,000,000 each:—

| Products | 1914 | 1909 |
|---|---|---|
| Men's clothing | $39,048,000 | $36,921,000 |
| Copper, tin and sheet-iron products | 25,491,000 | 16,909,000 |
| Canning and preserving | 18,029,000 | 13,709,000 |
| Lumber and timber products | 11,911,000 | 12,134,000 |
| Foundry and machine products | 10,659,000 | 11,978,000 |
| Slaughtering and meat-packing | 17,100,000 | 13,683,000 |

By 1914 there had been added to this list: cars and general shop construction and repairs, for steam railways, $13,229,000; fertilizers, $13,987,000; printing and publishing, $11,263,000. Since 1914 there has been a large increase in the number of manufacturing establishments and in capital invested in manufactures in Baltimore, so that the 57%, which in that year was the contribution of that city to the value of manufactures in the state, has been increased. Outside of Baltimore, the chief manufacturing centres are the western Maryland cities, Cumberland and Hagerstown.

*Fisheries.*—In 1908 the value of the Maryland fishery products had fallen from the second place which it occupied in 1897 to fifth place. Recognizing that the decreased output was due to the unregulated stripping of the natural oyster beds, the state by an Act of 1916 created a Conservation Commission charged with the execution of all laws relating to oysters, fish, crabs and game, supplanting the Shell Fish Commission, the two Fish Commissioners and the state Conservation Bureau, and assuming control and coordination of all existing agencies for the furtherance of the fishing industry and game protection of the state. The report of the Shell Fish Commission in 1907 laid down the general principles of oyster culture followed by the Conservation Commission in encouraging the planting and gathering of oysters, the most valuable products of the Maryland waters. The state had faced a steady decline in its oyster industry since the year 1897, when 7,255,000 bus. were taken from Maryland waters. In 1908 the catch had fallen to 6,232,000 bus., and in the season of 1916–7 to 4,120,819 bus. In the hard winter of 1917–8 an even lower mark was reached, but exceptional conditions account for the poor catch of that year. There is reason to believe that the encouragement given to planting and the enforcement of the "cull" law are beginning to have effect, for since the extremely small catch of 1917–8 there has been a steady increase until the highest figure for several years was attained in 1920–1 with a catch of 4,967,433 bus. (figures of April 15, before the close of the season). An ambitious planting programme has been outlined for all the fish products of the state by the Conservation Commission, in addition to its regular scheme by which many millions of fry are released into Maryland waters every year.

*Communications.*—Beginning with the passage of the "Shoemaker, or State Aid" Act in 1904, the state entered upon a programme of road construction, the prosecution of which has provided it with one of the best road systems of any state. In 1908 the State Roads Commission was created by the Legislature to construct all state roads and state-aid roads, and as the result of its activities there have been built of both classes 1,585 m. of macadam, concrete and other surfaced roads on the foundations of the once privately owned turnpikes and the connecting county roads.

*Education and Religion.*—The period of 1910–20 was a notable one in the development of the Johns Hopkins University, of Baltimore. In 1920 the Legislature passed an Act merging the university of Maryland (Baltimore) with its schools of law and medicine, and the Maryland State College of Agriculture (College Park, Md.) under the name of the university of Maryland and under the control of a Board of Regents. In secondary education, the future betterment of the school system throughout the state was provided for by the reorganization of the State Board of Education by legislative enactment of 1916. Industrial and vocational training in the schools have been the subjects of experimentation, but no definite policy has been established with regard to their continuance.

All denominations in Maryland reported 602,587 members in 1916, an increase of 99,870 since 1906. In 1916 the church membership was divided among 2,955 organizations, representing more than 60 denominations. The value of church property in the state was $29,162,381. The Roman Catholic church membership (all baptized persons including infants) numbered 219,530. Following in the order named were the Methodist Episcopal (112,853), Protestant Episcopal (38,469), General Synod of the Evangelical Lutheran (33,555), National Baptist Convention, coloured, (29,405), Presbyterian Church in the United States (19,603).

*History.*—A series of Acts passed since 1910 indicate a progressive quality in the administration of the state. These Acts created the Public Service Commission (1910), the State Industrial Accident Commission (1914), the Conservation Commission, (1916), the State Board of Prison Control (1916), the State Tax Commission (1914), the State Roads Commission (1908), and the reorganization of the State Board of Education (1916). In 1916 the budget system was adopted and in 1920 a merit system for state employees was put in operation. During the World War, Maryland furnished the following volunteer organizations: three regiments of infantry, one battalion of field artillery, one troop of cavalry, four companies of coast artillery, one field hospital, one ambulance company, two battalions of naval militia and one company of negro infantry. With the exception of the coast artillery companies and the coloured company these volunteer organizations became part of the 29th Div. and the infantry personnel, as the 115th Regt., saw active service on the American front in France. The 3rd Coast Artillery Company, and volunteers from the others, became the 117th Trench Mortar Battery, and as part of the Rainbow Div. was actively engaged at the front in France for many months. By the selective draft 34,000 men were sent from Maryland. Four great military establishments were located in Maryland during the war: the Aberdeen Proving Grounds, the Edgewood Arsenal, Camp Meade and Camp Holabird. Because of their good locations and convenience to Washington, these establishments have been retained for military purposes by the War Department.

Maryland subscribed to the five Liberty and Victory loans $290,247,200, a sum which exceeded the total of its minimum apportionment by nearly $43,000,000, and was $13,000,000 larger than the total of its maximum apportionment. Maryland was the sixth state to ratify the Prohibition amendment but never ratified the Suffrage amendment. Recent governors have been Austin L. Crothers (Dem.), 1908–12; Phillips Lee Goldsborough (Rep.), 1912–6; Emerson C. Harrington (Dem.), 1916–20; Albert C. Ritchie (Dem.), 1920– . The latter was elected by only 165 votes over his Republican opponent, polling 112,240 votes to 112,075.

(1918); *Statistical Abstract of the U.S.* (1919); *Maryland Manual*, 1919–20; *Synopsis of Laws Enacted by the State of Maryland* (3 parts, 1916, 1918, 1920, compiled by Horace E. Flack, Dept. of Legislative Reference, Baltimore, Md.). Annual Reports of the Conservation Commission of Maryland, 1916–20; *The Maryland Almanac* for 1921. (L. C. W.)

**MARZIALS, SIR FRANK THOMAS** (1840–1912), British civil servant and man of letters, was born at Lille in France Jan. 13 1840 and educated at a school kept by his father who was a clergyman. He entered the War Office during the Crimean War and became accountant-general in 1898, retiring in 1904. He was knighted that year and became a member of the Patriotic Fund Corporation. He was also vice-president of the London Library. As one of the editors of the *Great Writers* series, he contributed *Lives* of Dickens, Victor Hugo and Molière (1904) and also wrote *Death's Disguises and other Sonnets* (1889) and translated the *Chronicles of Villehardouin and Joinville.* He died at Notting Hill, London, Feb. 14 1912.

**MASCAGNI, PIETRO** (1863– ), Italian composer (*see* 17.835). His later works include *Isabeau* (1911) and *Parisina* (1913).

**MASEFIELD, JOHN** (1875– ), English poet, playwright and novelist, was born in 1875. His early poems were of the sea (*Salt-Water Ballads*, 1902; *Ballads*, 1903, etc.). He also wrote sketches of buccaneers, *On the Spanish Main* (1906), and two stirring novels, *Captain Margaret* (1908) and *Multitude and Solitude* (1909), as well as editing *The Voyages of Captain William Dampier.* But narrative poetry and drama proved his natural means of expression, as he showed in his poems *The Everlasting Mercy* (1911); *The Widow in the Bye-Street* (1912); *Dauber*

(1913); *The Daffodil Fields* (1913); *Lollingdon Downs* (1917); *Reynard the Fox* (1919); *Right Royal* (1920); *Enslaved and other Poems* (1920); *King Cole* (1921); and in his sombre plays, *The Campden Wonder* (1907); *The Tragedy of Nan* (1909); *Pompey the Great* (1910); *The Faithful* (1915); and *Good Friday* (1916). He also published some prose war sketches, *Gallipoli* (1916); *The Old Front Line* (1918); *St. George and the Dragon* (1919).

**MASON, ALFRED EDWARD WOODLEY** (1865– ), English novelist, playwright and politician, was born in Camberwell May 7 1865 and was educated at Dulwich College and Trinity College, Oxford. Whilst at Oxford he played Heracles in a production by the O.U.D.S. of the *Alcestis* of Euripides, and when he left the university he joined a theatrical company and toured for a time in the provinces. He soon, however, abandoned acting for literature. His first novel, *A Romance of Wastdale*, was published in 1895. He followed it by the successful *Courtship of Morrice Buckler* (also dramatized) in 1896 and *Miranda of the Balcony* (dramatized in New York) in 1899. Amongst later novels *The Four Feathers* (1902); *The Broken Road* (1907); *Running Water* (1907) and *The Turnstile* (1912) are the most notable. *At the Villa Rose* (1910), an experiment in the detective story, was successfully dramatized and presented at the Strand theatre, London, in July 1920. Besides the dramatization of his novels, he wrote as original plays *Colonel Smith* (1909), *The Witness for the Defence* (1911) and *Open Windows* (1913). He sat as Liberal member for Coventry in the House of Commons from 1906 to 1910. During the World War he held a commission in the Manchester regiment and later was on the general staff of the R.M.L.I. He also went on missions to Spain and to Mexico for the Intelligence Dept. of the Admiralty and utilized some of his experiences in a novel *The Summons* (1920).

**MASPERO, SIR GASTON CAMILLE CHARLES** (1846–1916), French Egyptologist (*see* 17.848), died in Paris June 30 1916. During his second term of office as director-general of the Service of Antiquities at Cairo he was made an hon. K.C.M.G. (1909). He retired in 1914.

**MASSACHUSETTS** (*see* 17.850).—The pop. in 1920 was 3,852,356, an increase of 485,940 or 14·4% since 1910, as against 20% in the preceding decade. Nearly one-third of the state's inhabitants lived in metropolitan Boston. Less than 1·3% were negroes; 27·9% were foreign born, of whom 24·4% came from Canada. The average density of pop. was 479·2 per sq.m., as against 418·8 in 1910. The urban pop. (in 169 places of more than 2,500) was 94·8% of the whole as against 92·8% in 1910. The pop. of the 13 chief cities was:—

| | 1920 | 1910 | Increase per cent |
|---|---|---|---|
| Boston | 748,060 | 670,585 | 11·6 |
| Worcester | 179,754 | 145,986 | 23·1 |
| Springfield | 129,614 | 88,926 | 45·8 |
| New Bedford | 121,217 | 96,652 | 25·4 |
| Fall River | 120,485 | 119,295 | 1·0 |
| Lowell | 112,759 | 106,294 | 6·1 |
| Cambridge | 109,694 | 104,839 | 4·6 |
| Lynn | 99,148 | 89,336 | 11·0 |
| Lawrence | 94,270 | 85,892 | 9·8 |
| Somerville | 93,091 | 77,236 | 20·5 |
| Brockton | 66,254 | 56,878 | 16·5 |
| Haverhill | 53,884 | 44,115 | 22·1 |
| Holyoke | 60,203 | 57,730 | 4·3 |

*Agriculture.*—Farm property in 1920 was valued at $300,471,743, including live stock valued at $33,524,157. The total value of farm products in 1919 was $87,558,456—crops representing 61·3% of this, and animal products 38·7 per cent. The leading crops and their percentages of the total crop value were: hay and forage 37·5%, vegetables 28·5% and fruits 18·2 per cent. The production of the chief cereals was as follows, in bushels:—

| | 1919 | 1909 |
|---|---|---|
| Maize | 1,921,607 | 2,402,738 |
| Oats | 1,515,933 | 2,029,381 |
| Buckwheat | 23,238 | 32,926 |
| Winter Wheat | 21,337 | 1,710 |
| Spring Wheat | 11,916 | 694 |
| Barley | 11,832 | 9,021 |
| Rye | 46,261 | 59,183 |

The yield of apples in 1909 was 2,550,259 bus.; in 1919, 3,187,210. Two-thirds of the cranberry yield of the United States in 1920 was raised in the bogs along the S.E. coast of the state. Of the animal products 73% were of the dairy and 26% poultry and eggs.

*Mineral Products.*—During the decade there was a large increase in the production of building-stone, crushed rock for road and street making, and sand. In 1913 the value of the products of mines and quarries and their manufactured derivatives was $11,292,723. The production of monuments and tombstones was: 1909, $2,852,650; 1918, $2,571,750. The value of clay-products of the state decreased from $1,647,362 in 1908 to $1,451,715 in 1918, of which latter amount $1,230,711 was the value of common brick.

*Manufactures.*—Massachusetts, with a limited local market for its manufactured products, scanty resources in the form of raw materials, and a declining trans-Atlantic commerce, has added little to its railway and terminal facilities. Only four states are smaller in area; yet in 1918 only four states exceeded it in the value of its industrial output. Its advantage has lain in having a surplus of capital, in its unsurpassed supply of skilled labour and in the superior organization of its factories. In its earlier development it utilized its local water-power, of which it had a liberal supply. Then it became largely dependent on coal for fuel, imported at increasingly high cost. In 1910 the total value of manufactures was $1,490,527,386; in 1914, $1,641,373,047, and in 1918, $3,851,346,215, an increase over 1900 of 324 per cent. While the increase in value is largely to be accounted for by the increased prices, the state as a whole made commendable industrial progress. In textiles (cottons, worsteds and woollens), in boots and shoes, boot and shoe cut stock and findings, rubber footwear, and in fine writing-paper, Massachusetts in 1919 was the foremost state.

The following table deals with the manufacture of leather boots and shoes, cut stock and findings:—

*Boots and Shoes.*

| | Estab's. Reported | Employees | Value of Products |
|---|---|---|---|
| 1909 | 469 | 47,710 | $187,045,767 |
| 1914 | 464 | 76,944 | 200,529,858 |
| 1919 | 474 | 77,196 | 361,090,261 |

*Boot and Shoe Cut-Stock and Findings.*

| | Estab's. Reported | Employees | Value of Products |
|---|---|---|---|
| 1909 | 391 | 8,353 | $49,297,148 |
| 1914 | 420 | 8,170 | 54,658,155 |
| 1919 | 422 | 9,964 | 118,310,617 |

The value of boots and shoes and cut stock in 1918 was 40% of the country's output, New York ranking second with 13·4 per cent. In 1918 the textile industries employed 30% of the manufacturing wage-earners, the products being 30·9% of the total industrial output and being valued at $1,191,650,551. Nearly one-half of this was in cotton goods and formed 28·9% of the output of the whole country, N. Carolina, the next largest producer of cotton goods, turning out 13·4% of the whole. The output of woollen and worsted goods in 1918 was more than 30% of that of the whole country, Pennsylvania producing the next largest amount. The increase in value from 1900 to 1918 was 5·78%—showing a marked decrease in quantity when the difference in prices is considered. The increase in the value of boots and shoes and cut stock for the same period was 136%—showing small increase in quantity. Boston and Worcester were the principal centres for foundry and machine-shop products, valued in 1918 at $341,751,367. Other industrial products, in order of importance, were: rubber goods, $120,757,575; tanned, curried and finished leather, $81,462,273, in the manufacture of which Massachusetts was second among the states; paper and wood pulp, $91,428,346; slaughtering and meat-packing, $117,730,023; printing and publishing, $73,267,130, of which $39,104,873 was the value of newspapers and periodicals; electrical machinery, apparatus and supplies, $83,742,359; cordage, twine and jute goods, $45,574,887, in which the state was second only to New York; furniture, $17,058,360; jewelry, $9,526,836, Massachusetts ranking second only to Rhode Island; and confectionery $40,869,064, in which Massachusetts was third among the states.

The state is also noted for its fishing industry, the fleets visiting the Newfoundland Banks being very important, with Gloucester and Boston as chief centres of the trade. The value of products in 1920 was $7,596,905. Cod were valued at $2,311,011; haddock, $2,655,303; mackerel, $748,682; and halibut, $518,598.

*Education.*—Several fundamental changes were made in the organization of the educational enterprises of the state in 1919. Among the most important were the consolidation into a new department of education of several related activities, the abolition of the Board of Education and the creation of the Advisory Board of Education, consisting of six members and the Commissioner of Education, who is *ex-officio* chairman. The passing of the Board of Education, established in 1837, marks the close of an important era in the development of a state policy of education. In vocational

education rapid progress in the decade 1909–19 is shown by the following statistics:—

| | 1919 | 1909 |
|---|---|---|
| Schools in which vocations were taught | 107 | 6 |
| Occupations in which instruction was given | 50 | 4 |
| Enrolment in vocational classes | 2,500 | 1,400 |
| Cost of vocational training | $881,000 | $5,000 |

Another significant development was in university extension. The department has carried on its work by correspondence instruction, class instruction, and Americanization classes. In the period Dec. 1 1919 to Nov. 20 1920 6,188 students were receiving instruction by correspondence, 15,520 were registered in adult immigrant classes and 23,720 in other extension classes. In 1911 the Teachers' Registration Bureau was established, a free agency which has proved very successful; three years later a retirement system was put into operation, with membership compulsory, and provision for retirement at 60 years of age under certain conditions or by compulsion at 70. In 1920 the salaries of superintendents in superintendency unions (two or more towns employing one superintendent) was fixed at a minimum of $2,250, with certain reimbursements by the state and allowances for travelling. The Legislature of 1921 made several notable changes, among which are the following: state aid to high schools in towns of less than 500 families was increased from $500 per school to $250 per teacher. Transportation is compulsory from towns where there is no high school, with provisions for state reimbursement.

The State Department may now grant the degree of Bachelor of Education to any person completing a four-year course in a state normal school—one school giving it in the commercial course only, one in household arts, one in art and two in regular courses. In 1920 over $1,000,000 was spent for normal schools and teachers' training. Pupils from 14 to 16 years of age must have completed the requirements of the sixth grade before being certified for employment. Public-school teachers and superintendents have the right to a hearing before the school committee, accompanied by a witness, before dismissal from service. Every town with a valuation of over $1,000,000 must employ a school nurse. Indoor and outdoor games and athletic exercises are also required. Regular public-school teachers cannot be paid less than $750 a year. Reimbursements to small towns and cities are provided, with special arrangements for those of low valuation, enabling them to have good teachers.

*Finance.*—The receipts of the state in 1909 were approximately $14,700,000 and those in 1920 approximately $47,350,000, or more than three times as much. These figures represent receipts for revenue purposes only and do not include receipts from the issue of bonds or notes. The payments in 1909 were about $17,100,000 and in 1920 about $52,900,000. These represent governmental cost and include no payments of money borrowed. In 1919 the funded debt of the state was $126,555,662 and the total debt $129,404,091.

*Road-building.*—During 1920 nearly 122 m. of highway was constructed, as well as 22 m. commenced but not completed. Of this, 39 m. was gravel, 38 m. of bituminous macadam, 16 m. of cement concrete, 4 m. of sand and asphalt mixed, and 5 m. water-bound macadam with bituminous surface treatment. Of state highway 27 m. was surfaced, 14 m. widened and resurfaced. Some roads were being constructed 20 ft. wide instead of 18 feet. Much was under construction in 1921 with $6,000,000 more to be spent. The total length of state highways at the end of 1919 was 1,311 m. and the amount spent on roads in that year was about $1,610,200.

*Banking.*—The resources in 1919 of the national banks within the state were $1,003,945,000. There were 634 banking institutions and agents under state law, with resources of $2,488,606,935, divided as follows: 196 savings banks, $1,215,244,815; 105 trust companies, $1,076,214,436; 190 cooperative banks, $154,879,638; three savings and loan associations, $2,399,791; Mass. Hospital Life Insurance Co., $30,918,328; one foreign banking corporation, $1,838,749; 60 credit unions, $2,791,165; 77 steamship agents receiving deposits of $3,187,506; one state bank, $1,132,507.

*History.*—During the decade 1910–20 the most important laws enacted by the Legislature were the following: In 1912 a minimum-wage board was established with the right to determine wages of women and children. The inheritance law was amended so that only the real estate of a deceased non-resident is taxed, personal property taxes going to the state of residence. A 1913 law provided for the establishment and maintenance of continuation schools and instruction for working-children. A number of pure-food laws were enacted; also, a law providing for mothers' pensions. Laws relating to elections were so amended that on application signed by 1,200 voters in any senatorial district, or by 200 voters in any representative district, asking for the submission to the voters of any question of instruction to senators or representatives, the Secretary of the Commonwealth shall determine if such a question is one of public policy, and, if so determined, he shall place such question on the official ballot to be used at the next state election. Women voters were given the right of voting for candidates for school committees in 1881. In 1914 a measure was passed submitting to the people a constitutional amendment giving suffrage to women, suffrage being finally granted June 25 1919. In 1916 the civil and criminal jurisdiction of district or municipal courts was extended so that their process runs throughout the state and makes them courts of superior and general jurisdiction. An income tax was enacted. A new law to prevent misstatements in advertising went into effect May 25. An Act forbidding the sale of narcotic drugs, except by prescriptions carefully regulated, was passed in 1917. Massachusetts in 1918 ratified the Federal Prohibition amendment, being the 11th state to do this. That same year a budget system was adopted, also commissions were created to investigate the educational system of the state. The Legislature in 1919 made absentee-voting possible for those in military or naval service and others who make proper arrangements. It also passed a law making all Acts approved by the executive, unless subject to referendum, take effect 30 days after formal enactment. Emergency laws take effect upon passage. The maximum amount of deposit in savings banks was raised to $4,000. Manufacturing corporations can provide for representation of their employees upon the board of directors if more than half the employees so decide by secret ballot. Industrial accident compensation was increased. The income tax was revised. An Act reorganizing the executive and administrative functions of the state Government, approved July 23 1919, established many new departments, and a metropolitan district commission was authorized, with general supervision over the metropolitan area. The Legislature of 1920 passed a law providing for a state constabulary. Motion-pictures within the state were censored. Women were allowed to hold office. Suits were permitted by and against voluntary associations. Important "blue sky" legislation was enacted.

During the World War many emergency measures were passed by the Legislature. The subscriptions to the Liberty Loans were as follows: first, $177,236,400; second, $317,799,250; third, $228,329,750; fourth, $405,257,500; and to the Victory Loan, $252,767,450. Approximately 200,000 men were enlisted in the service of the Federal Government.

The governors for the decade were: Eugene M. Foss (Dem.), 1911–4; David I. Walsh (Dem.), 1914–6; Samuel W. McCall (Rep.), 1916–9; Calvin D. Coolidge (Rep.), 1919–20; and Channing H. Cox (Rep.), 1920– . The opening on July 29 1914 of a canal across Cape Cod shortened by 70 m. the distance by water from New York to Boston. (F. A. Cl.)

**MASSENET, JULES EMILE FRÉDÉRIC** (1842–1912), French composer (*see* 17.866), died in Paris Aug. 13 1912, having completed an opera, *Panurge*, just before his death.

**MASSEY, WILLIAM FERGUSON** (1856– ), New Zealand statesman, was born at Limavady, co. Derry, Ireland, on March 26 1856, the son of John and Marian (*née* Ferguson) Massey. He was educated at the national school and secondary school at Londonderry, and went to New Zealand in 1870 to join his parents who were among the Nonconformist settlers of 1862. Settling at Mangere, near Auckland, he became a farmer, and after serving an apprenticeship in local government entered Parliament as member for Waitemata in 1894. At the general election of 1896 he was elected for Franklin, and he has held that seat ever since. From 1895 to 1903 he served as Chief Opposition Whip in the House of Representatives. During those eight years Seddon was at the height of his power and the fortunes of the Opposition were at their lowest ebb. For about half this period the party was without a leader, but the courage and faith of the Chief Whip held the party together, and in 1903 he was elected leader. Mr. Massey's chance came after the general election of 1911, which gave the Reform party, as it was now called, a small majority. After serving for 18 years in the Opposition, and without holding any intermediate office, Mr. Massey became Prime Minister on July 10 1912.

His first Cabinet held office for three years, the last of which was the first year of the World War. In Aug. 1915, the general

election held in Dec. 1914 having resulted in almost a dead heat between the parties, a Reform-Liberal coalition was effected for the purposes of the war, with Mr. Massey as Prime Minister and Sir Joseph Ward, the Liberal leader, as Finance Minister. The national Government thus formed lasted throughout the war, and on its dissolution by the Liberals in Aug. 1919 Mr. Massey formed a new Reform party Cabinet. At the general election in the following Dec. he scored a decisive victory, due in a large measure to the very difficult position forced upon him at short notice by the dissolution of the Coalition. He was still in power at the close of 1921.

The portfolios held by Mr. Massey in his first two administrations as Prime Minister included those of Lands, Agriculture, Labour, Industries and Commerce, and Imperial Government Supplies. On Sir James Allen's retirement in 1920 he became Minister of Finance, holding also the portfolio of Mines and Railways. Besides enabling and encouraging the country to throw its whole weight into the war, Mr. Massey rendered important service by representing it at the Imperial War Cabinet and War Conference meetings of 1917 and 1918, at the Peace Conference in 1919, and at the Imperial Conference of 1921. At the Peace Conference he faithfully represented the sentiment of New Zealand in pleading for the retention of German Samoa in British hands, and in his uncompromising attitude on the indemnities and reparations to be exacted from Germany. The energy which he displayed in securing the Dominion a share in the valuable phosphates of Nauru I. was also much appreciated. Mr. Massey did valuable work as the second British representative on the Commission on Responsibilities for War and the Enforcement of Penalties, and as president of the sub-committee on Facts and chairman of the Drafting Committee.

He married in 1882 Christina (C.B.E. 1919), daughter of Walter Paul of Auckland, and had three sons (of whom Maj. F. G. Massey served in the war and won the M.C. and D.S.O.) and two daughters. He became a Privy Councillor in 1913, a freeman of London, Edinburgh and five other British cities, and hon. LL.D. of Cambridge and Edinburgh universities.

(A. R. A.)

**MASTERS, EDGAR LEE** (1868– ), American writer, was born at Garnett, Kan., Aug. 23 1868. At the age of 21 he entered Knox College, Ill., but left after one year to read law in his father's office. He was admitted to the bar in 1891 and practised thereafter in Chicago. For several years he was associated with Clarence S. Darrow, known as counsel for labour leaders. He was a member of the National Institute of Art and Letters. The book that first brought him public notice was *Spoon River Anthology*, published in 1915, an extraordinary collection of epitaphs on members, in all walks of life, of a mid-western town. Within three years 50,000 copies were sold. Like much of the modern "realistic" literature it over-emphasizes pathological accidents and ignores the sane and permanent essence of life.

His other works include: *The New Star Chamber, and Other Essays* (1904); *Blood of the Prophets* (1905); *Songs and Satires* (1916); *The Great Valley* (1916); *Toward the Gulf* (1918); *Starved Rock* (1919); *Domesday Book* (1920) and *Mitch Miller* (1920); *The Open Sea* (1921); besides several plays, *Maximilian* (1902); *Althea* (1907); *The Trifler* (1908); *The Locket* (1910); and *The Bread of Idleness* (1911).

**MASURIA, BATTLES IN, 1914–5.**—The district of East Prussia known as Masuria, which practically coincides with the sickle-shaped region of lakes that rules the geography of the province, was the scene of several great battles in 1914 and the first half of 1915. For the reasons discussed under EASTERN EUROPEAN FRONT CAMPAIGNS (Part I.), the lake region was not so much a battle-ground itself as a barrier behind which the Germans could either resist with inferior numbers or manœuvre for decisive battle at one or both extremities of it. In certain circumstances, the barrier itself could not only passively but actively contribute to the manœuvre, owing to its having sally-ports at Lötzen and elsewhere. Simple resistance was the function of the barrier only in Oct. and Nov. 1914, when the Germans in East Prussia had to gain time, by defence with minimum forces, for a decision to be fought out in Poland. In other circumstances it played its part in great offensive manœuvres, and these German offensives—Tannenberg in Aug. 1914, the "Masurian Lakes" in Sept. 1914, and the "Masurian Winter Battle" in Feb. 1915—form the subject of the present article.

### I.—TANNENBERG

As narrated under EASTERN EUROPEAN FRONT CAMPAIGNS (Part II.), the indecisive battle of Gumbinnen, N. of the lakes, combined with the oncoming of the Russian II. Army W. of them, led to a crisis in which the evacuation of the entire province by the German VIII. Army was only prevented by the appointment of General-Oberst von Hindenburg, with Maj.-Gen. Ludendorff as his chief of staff, to retrieve the compromised situation by battle. The contemplated offensive had as its object the defeat of the Russian II. Army of Samsonov at or within the western extremity of the lakes, before the Russian I. Army of Rennenkampf, only momentarily checked at Gumbinnen, could pass beyond their northern extremity, isolate Königsberg, and flood the interior of East Prussia, without further regard to the defensive barrier. It ended in a success that was all the more brilliant because of its unpromising beginnings, and all the more inspiring to German patriotism as the name and locality of the battle recalled the historic defeat of the Teuton by the Slav in 1410 (*see* 21.905). Thus, it was natural, not only that Hindenburg should become at once the national hero of Germany, but also that a host of legends should arise in connection with the battle.

The most picturesque and therefore most widespread of these legends is that of the Russians being driven into the lakes which Hindenburg had personally reconnoitred in peace-time, with a view to such an operation, but though it is difficult to find the seed of this legend in any incidents of the battle, the magnitude of the success and the apparently perfect precision with which the plan was carried into execution undoubtedly lent weight to the idea that the scheme was long premeditated. In one sense this was true. The idea of double envelopment had penetrated throughout the German army since von Schlieffen had set up "Cannae" as the model. The manœuvre on interior lines behind the lake barrier was suggested, and even imposed, by geography. And in one at least of the numerous "war-games" in which the German general staff tried out the alternative types of defence against Russian invasion from the S., the map operations ran a course which was generally similar to that of the battle. It was not surprising, therefore, that the idea occurred both to Ludendorff on his way from the western front and to the staff officers on the spot before the new commander and chief of staff arrived. At any rate, the proposal was at once made by the former and accepted by the latter. But the difficulty lay in the execution, and in reality, as will be seen, the battle was a series of changing situations which demanded ever new dispositions on the part of the Germans. These dispositions were throughout inspired by the same idea—"Cannae"—and restricted by the same unknown factor—Rennenkampf.

On Aug. 23 General Samsonov's II. Army—consisting of the VI., XIII., XV., and XXIII. Corps, one rifle brigade and three cavalry divisions, to which a few days later was added the I. Corps—was within Prussian territory at and near the line Soldau–Neidenburg–Ortelsburg, with cavalry farther W. on the Lautenburg and Strassburg routes. To the E., the II. Corps, nominally of Samsonov's army, really acting in liaison with Rennenkampf, was advancing from Bobr by Grajevo to face the E. front of the lake barrier. Rennenkampf, for his part, was still on the Gumbinnen battlefield expecting a new battle on the line of the Angerapp and the northern lakes. Samsonov had disposed his four (five) corps in order from right to left, VI., XIII., XV., XXIII. (I.), with the right échelon forward on Ortelsburg (in the hope of obtaining liaison with the II. Corps of Rennenkampf's command), and the left kept back (in the face of a German offensive from the Vistula). His advance was slow and methodical, averaging perhaps 5 m. a day, and at every halt a position was entrenched, as national temperament and the experiences of the Manchurian War dictated. Opposed to

the three central corps (XIII., XV., XXIII.) was General von Scholtz with his XX. Corps and part of a force of Landwehr, Ersatz and Landsturm, which had been taken out of the fortresses of Graudenz and Thorn to watch the line of the frontier W. of Soldau. Opposite the Russian VI. Corps on the Ortelsburg side, and holding the lake barrier, there were other German forces of the same kind.

The first efforts of the German command were directed to forming an attack-mass on the basis of the XX. Corps. This mass would have to be taken from the forces confronting Rennenkampf, and released in succession according to the activity displayed from day to day by him. Meanwhile, Scholtz's mission was to maintain an intact front on the wings of which these other forces, of greater or less strength, would come up for the enveloping effort. On the right or W. wing these forces consisted of the 1. Corps (von François), which, after Gumbinnen, had been entrained for stations near the Vistula but then had its transport switched to the region at and E. of Deutsch Eylau, and of such Landwehr and Ersatz as could be assembled at the E. end of the frontier cordon. On the other flank, there were successively drawn off from Rennenkampf's front the 3rd Res. Div., the I. Res. Corps (von Below), the XVII. Corps (von Mackensen), and the 6th Landwehr Bde. from the Lötzen area, the defence of Lötzen being left to its Landsturm garrison, the defence of Königsberg to its mobile reserve posted on the Deime, and the observation of Rennenkampf's army to two cavalry brigades. But between Aug. 23–6, the dates at which the offensive was to begin, the 3rd Res. Div., part of the frontier Landwehr and Ersatz forces, and even the first units of the I. Corps which entrained, were involved in the fighting of the XX. Corps, which had to sustain the weight of Samsonov's attack, particularly at Orlau and Lahna on Aug. 23.

On the night of Aug. 25, Below (I. Res. Corps), after cross-country movements imposed by the crowding of main roads with refugees, had reached Seeburg; the 6th Landwehr Bde., Lautern; Mackensen (in one long march), Bischofstein. Von Scholtz with his XX. Corps and attached formations held the line Kosten Forest (exclusive)–Gilgenburg–Hohenstein (inclusive); von François (I. Corps) was detraining at various stations around Deutsch Eylau and forming up on the line Tuschau–Kielpin; while Mühlmann's detachment of the Landwehr and Ersatz forces had driven hostile cavalry out of Strassburg and Lautenburg, and was ready to coöperate from Lautenburg eastward. In a day or two the catalogue of available German forces was to be completed by the arrival at Allenstein of von der Goltz's Landwehr div. from Schleswig-Holstein. On the Russian side, while the I. Corps hung back, as ordered, in échelon on the left, and the XXIII. and XV. swung up in pursuit of von Scholtz from the E.–W. line facing Gilgenburg–Lahna to a N.N.E.–S.S.W. line facing Gilgenburg–Hohenstein, the XIII. Corps was advancing northward on Allenstein, and the right échelon (VI. Corps and 4th Cav. Div.) from Ortelsburg had reached Bischofsburg. Rennenkampf meanwhile reached the line Insterburg–Angerburg and his left corps was approaching the eastern lake barrier. But liaison between Rennenkampf and Samsonov, and their common superior Zhilinsky, was already, as it remained to the end, imperfect; and even within the II. Army itself the various corps maintained only intermittent touch with headquarters by wireless (sent *en clair*), and casual communication by motor-car and aircraft.
